2022-06-08 - C.S. Lewis_ His Occult Connections (Theosophy, Rosicrucianism, Kabbalah) - Nate (692225

All right, we're back in another Sound the Battle Cry, and today the title of the message is C.S. Lewis, His Occult Connections, Order of the Golden Dawn, Rosicrucianism, and Theosophy. Now this may be an emotional topic for many of you who are watching this, you don't want to hear something like this, you don't want to believe it's true because you grew up reading this man's books, maybe even watching some movies, the Narnia movies, and all those other types of things, but we've got a proverb for you, Proverbs 18.13, which says, He that answereth a matter before he heareth it, it is folly and a shame unto him. Okay, do not jump to a conclusion and dismiss something out of hand before you hear it.

You need to investigate the matter completely, then make a decision after, but you need to look into the facts first. You know, a secular version of this would be Albert Einstein. Which is, condemnation before investigation is the height of ignorance. Okay, so don't condemn before you investigate, don't answer the matter before you hear it, just hear it out. That's all I'm asking. Now, C.S. Lewis. You know, I grew up having these books. I was given his books, Chronicles of Narnia books. I saw the old films. And those types of things, I don't think I ever, maybe I watched one of the newer ones, but I definitely watched the older ones and had the books. Okay, so this isn't something that I didn't grow up with. But, here's the thing.

Why am I doing this show? A couple reasons. First of all, I had this information a long time ago, over eight years ago. And I actually gave this information. All this information to a pastor in the past. He took the information, kind of butchered it, and put it online. He got like 40,000 views off of that and all that stuff. And it was fine at the time. But it's time for that information to come back out. And I'm the one that gave that information. Number two, I saw recently on a Jay Dyer, who is, he's a researcher. He's written a couple books. Esoteric Hollywood. He does a lot of research about conspiracies and all those other types of things. He hosted the fourth hour of the Alex Jones Show.

And he was trying to say that C.S. Lewis and Tolkien were good guys who were warning against a technocracy and all this stuff because of C.S. Lewis' science fiction trilogy. Especially the third book, which is called That Hideous Strength. And immediately I thought this was ridiculous because of what I knew about C.S. Lewis. That he was this good guy supposedly warning against these types of things. And it's kind of confusing coming from

a person like Jay Dyer because he is a really good researcher for the most part. But in this instance, completely was wrong. Off the target. So I don't know what's going on with that. Either he just, something that he missed and he hasn't had access to, the information that I'm going to present today.

Or maybe it was intentional. I don't know. I'm not going to accuse him of that. I'll be charitable and say that he just didn't know. Nevertheless, we're going to get into some information today that is very important and very clear. I don't think you can deny this. It's pretty apparent C.S. Lewis' connections to the Order of the Golden Dawn, Rosicrucianism, as I said, Theosophy, Paganism, his friends, his fascination with Paganism and the occult, all these other types. There's just so, it's overwhelming. And the fact that he put it in his books. There's just, his books are saturated with witchcraft and Paganism. And so, it really shouldn't be that big of a shock to a lot of people. But for some reason, this man, C.S.

Lewis, is so venerated today, exalted in Christian circles of many different persuasions and denominations. Everybody loves this guy. They love to quote him. They love to, you know, push his views and quotes and all this other type of stuff, his books. But we're going to see a picture painted today that shows a very, very different type of man than is often portrayed by most modern-day Christendom. All right, so let's read a few more scriptures and we'll get into the information. 1 John 4.1 Beloved, believe not every spirit, but try the spirits, whether they are of God. Because many false prophets are gone out into the world. Okay? We've got to try the spirits. We've got to test them. The false prophets. There's a lot of false prophets.

Jesus said there'd be many that come in my name. Many false prophets that would deceive many people. That's why the first thing he said is, take heed that no man deceive you. So you've got to test everything and everyone. Don't just blindly accept and trust things. Like, if everybody just blindly pushes to see us lose, you've got to question it and go, okay, well, what's the deal with this guy? Why don't I read about him? What's his background? Here's another one. Ephesians 5.11 And have no fellowship with the unfruitful works of darkness, but rather reprove them. Don't fellowship with them, but reprove them. Drag them into the light. Shine the light on these unfruitful works of darkness. And then the last one is Job 34. 21 and 22.

For his eyes are upon the ways of man, and he seeth all his goings. There is no darkness nor shadow of death where the workers of iniquity may hide themselves. Nowhere to hide. You know, secret societies, mystery schools, they love to hide. Everything's under the cover of secrecy and darkness. There is no darkness where the workers of iniquity may hide themselves. Why? Because the eyes of God are upon the ways of man, and he seeth all his goings. He sees everything. And it's going to be made manifest. Be sure your sin will find you out. All right? So, we're going to get into this information, and I'm going to give you all the sources. In fact, there's so much more information that I can't even present today that I'm going to give you all the links.

You could go and research way more yourself and see way more evidence. Go check all the primary source documentation. Check all the quotes. Check it all. Check it all for yourself. We could sit here and talk about this for 12 hours, chasing every, you know, rabbit hole. But we're going to condense it down today. All right? So, let's get into it. So, first of all, I'm just going to show you real quick. If you go to this website, which is crossroad.to, there's a lot of these resources on here, a lot of articles about C.S. Lewis. And so, if you want to go research this yourself, I'll leave a link for this. But we have quotes here exposing C.S.

Lewis putting witchcraft and occult philosophies, like it says here, Gnosticism, Kabbalah, Rosicrucianism, Swedenborgism, Freemasonry, Hegelian dialectic, all this stuff, all blended with Christianity and swayed the beliefs of C.S. Lewis. He put those beliefs in these books. We got excerpts from The Magician's Nephew, The Abolition of Man, Mere Christianity, Surprised by Joy, Discarded Image, That Hideous Strength, Chronology. Okay, so, you see all these different articles. You can scroll down there. You can look at that. All right, but we're going to get into the information I want to go over today. But that just shows you how much there is to go through. All right, so I'm going to hold your hand and go through some of this stuff. This article called Trouble in Narnia, The Occult Side of C.S. Lewis.

Okay? Now, this is the main one we're going to focus on. And I have some additional resources I'm going to be adding to this. And we're going to jump around to a few more key points here to add to this. All right? So I'm just going to read from the article and make some comments as we go through. This person said, I've been uneasy about the enthusiasm for Narnia. Then one morning I woke up vividly remembering some things in the third Narnia book. And now I recognize the root of what has been troubling me. I had read all of C.S. Lewis' books, including his essays, his collection of letters, his science fiction, and his Narnia books. I read most of the books more than once. And I read the Narnia books many times.

I also read all the books of Charles Williams because he was a close friend of Lewis's and Lewis spoke so highly of his books. And I read all of George MacDonald's books because Lewis admired him and spoke well of his books. We're going to take a look at those guys more later. The Voyage of the Dawn Treader is the third book in the Narnia series. It directs and directly promotes spells and magic. Chapter 10, The Magician's Book, features a book of spells that is on an island inhabited by invisible creatures called Dufflepuds. Lucy works a spell to make the Dufflepuds visible. She goes through a spell book and it is beautiful and fascinating. Then she finds the right spell and says the words and follows the instructions.

And then the Dufflepuds and Aslan become visible. Her spell made Aslan visible. Her spell made Aslan visible. And he is pleased with what she did. So, if you guys don't know, in the Narnia books, Aslan is supposed to represent Jesus Christ. He's supposed to be this lion that represents Jesus. Now, why would, so, going with the allegory, right, because it's

supposed to be, they say, oh, this is, you know, Christian, it's a Christian allegory, he just uses symbolism, but he has a different message. Well, how does this fit the allegory? And the symbolism? If he has someone casting a spell to make Jesus Christ visible as Aslan, how does that make any sense? And he's pleased with what she did.

You think Jesus would be pleased if you did a witchcraft spell to make him appear, so that you're trying to do that? The book of spells is beautiful and fascinating. One spell is, it just, yeah, they're saying, they're not saying that it's good. They're just saying it's beautiful in the sense that that's what's alluring to children. And by the way, this guy's pretty sick in the head that he targeted children in all these books, right, the Narnia books. And you're going to see more and more how dark it really gets later. I mean, I'm going to prove it. I'm going to bring stuff out you've probably never heard of in your life. One spell is illustrated with pictures of bees that look like as if they're really flying.

In the world of CSI, back in Louis's day, this would not have caused practical problems. However, these days, kids can go to regular bookstores and buy spell books written by modern witches. Yeah, today it's just, everything's, you know, the explosion of the occult is all over everywhere. There's no hesitation, no warnings about it. In fact, anyone that warns against it is called a lunatic. That's pretty much that. Many Christians are treating the Narnia books as being an allegory with Aslan representing Jesus and the children representing Christians. If you do this with The Voyage of the Dawn Treader, then you portray Jesus as being pleased with Christians doing magic and working spells. Right, exactly. And you support the idea that there are good spells and good magic. That belief is the basis for modern white witchcraft.

Right? However, the Bible clearly forbids any form of witchcraft. Right, so let's go to that quote. But yeah, it's that whole white magic versus black magic thing. Right? And that's absolutely false. There's no distinction made in the Bible. There's nowhere in the Bible you can justify saying, well, there's good magic and bad magic. No, all magic, all witchcraft, all sorcery, it's all condemned. All of it. And let's look at some of the practices that are specifically named in the Bible. Okay? And this isn't part of some Old Testament ceremonial law like, you know, unclean meats or something like that. No. These are practices that are condemned in the New Testament as well. But let's read from Deuteronomy 18, verses 10 to 12.

There shall not be found among you anyone that maketh his son or his daughter to pass through the fire, or that useth divination, or an observer of times, or an enchanter, or a witch, or a charmer, or a consulter with familiar spirits, or a wizard, or a necromancer. For all that do these things are an abomination unto the Lord. Okay? So all these occult practices, any form of divination, witchcraft, all that stuff, it's all condemned. And then these occult practices condemned again, then these occult practices condemned again in the New Testament under the umbrella of witchcraft and sorcery. Okay? So in the New Testament it doesn't list out every single one of these practices but it's still the same things are condemned. Okay? Let's look at a couple of verses.

Galatians chapter 5 verse 19. Now the works of the flesh are manifest which are these adultery, fornication, uncleanness, lasciviousness, idolatry, witchcraft. Witchcraft condemned there. And then later on it says they which do such things shall not inherit the kingdom of God. And then Revelation 21.8 But the fearful, unbelieving, the abominable, murderers, whoremongers, and sorcerers, sorcerers, and idolaters, and all liars shall have their part in the lake which burneth with fire and brimstone which is the second death. Okay? So witchcraft, sorcery, is condemned in the New Testament not just the Old. But the Old gives you a little bit more of the detail of what goes under that umbrella. Alright? So let's go back to the article. There's no such thing as white and black witchcraft.

Now they might make the distinction because they go, well, you know, white witches don't harm anyone. They don't harm anything. We don't do sacrifices. We don't sacrifice anything. Not even animals. We don't harm anything. Right? That's what they try to say. But they still have no problem dealing with spirits and all these practices that are condemned. There's no difference. And you're still messing with the same thing. They even show that in the, you know, I did the show about the Force in Star Wars. They talk about how, and don't worry, I know it's fiction, but it's based on real life principles, where they say that the dark, there's the dark side and the light side of the Force. Right? But they get their power from the same Force.

They just say it's two sides of the same Force. And there's an admission there. Okay? So let's continue. In the book, the Dufflepuds are ruled by a wizard. He uses magic to rule the Dufflepuds because they aren't yet mature enough to be ruled directly by Aslan. So there is good magic and a good wizard. This magic prepares people for relationship with Aslan. Again, if Aslan is taken as a symbol for Jesus, then magic prepares people to become Christians. How does any of this make sense that a Christian would write this stuff? In our modern culture, that would mean that Wicca is a way to get to know Jesus and become his follower, which is absolutely absurd. Back when C.S. Lewis wrote the Narnia stories, Wicca did not exist.

Witchcraft did, but yeah, the modern day old religion, Wicca that they made, modern day old religion, the modern day religion created by Gerald Gardner, that practice, that didn't exist. It was starting to form. Kids who read the books couldn't experiment with spells. But this is a different world today. Now kids are surrounded by movies and TV shows that promote witchcraft, and they may know kids at the school of the devil. Yeah, I mean, again, the access to all these other types of things, it's much easier to find books on the occult. These types of practices, it's saturated everywhere in our culture. It's a lot easier to get involved with those types of things. What will happen when Disney comes out with a movie of the Voyage of the Dawn Trigger?

I don't know if they have yet, but I mean, Disney comes out with occultic stuff all the time. I mean, tons of their films are filled with occultism going on there, different types of practices. It's just, so it doesn't matter if they don't have that specific movie. Christian kids may wind

up feeling free to practice magic, and this could help break down the barrier between Christianity and Wicca. It could Christianize witchcraft in the eyes of some Christian kids, yeah. Well, anybody. It doesn't matter who it is. You know, and that's the thing. It's like, it's interesting because, on the one hand, a lot of people in society treat the occult as if it's a joke. I don't take it seriously at all.

Then there's the other side who don't think it's a joke, but they don't see a problem partaking of it, and they're involved in many different occult practices, and more prevalent than ever. Okay? But there is, but the point is, is that it's a lot easier for kids to get involved with this stuff. And it is true that, the types of films that they watch when they're younger, will spark curiosity in their minds. Now, I believe that if you just shelter kids and just tell them you can't watch anything, and you shut them off, and you say, why, because it's of the devil, that that's not good either. And that can actually push them in the other direction so that when they turn 18, first thing they do is go headlong at all that stuff.

It's rebellion, right? What's important is to teach about it. Okay? If your kids are going to have a lot of questions, so if they ask questions, you've got to be able to explain. Okay? Explain why things are not correct. Alright? So let's continue. Okay, there are some other, I mean, we're going to get into some crazy stuff, so please stay tuned. There are some other problems with C.S. Lewis's widespread influence. Blending God's truth to occult tales, he laid an enticing foundation for apostasy. For starters, in understanding the man, here's a quotation from a letter that he wrote describing a trip that he and his wife Joy took to Greece in 1960. He wrote, now this quote is wild. C.S. Lewis said, I had some ado to prevent Joy and myself from relapsing into paganism in Attica.

At Daphne, it was hard not to pray to Apollo the healer, but somehow, one didn't feel it would have been very wrong. And Lewis also said that Christianity fulfilled paganism, and paganism prefigured Christianity. We've got the sources at the bottom here, so you can look at those quotes. But he said it was hard for me not to relapse into paganism, and hard not to pray to Apollo the healer. Let me tell you something. I'm a Christian. I've never had a temptation to pray to an idol in my entire time. Not one time. That is a very, very strange thing for a professing Christian to say. So, you know, we're going to, like I said, we're going to have quotes like this from him.

But then also, when you see who he's associated with, and who he praises as his spiritual mentors and stuff, I mean, the picture that it paints is probably even so crazy that I can't even explain it all to you in this show because I don't know because a lot of you won't even understand it. But we're going to do as much as we can. In his autobiography, Surprised by Joy, Lewis tells how at age 13, he abandoned his Anglican faith due to the influence of a school mistress who was involved with theosophy, Rosicrucianism, spiritualism, the whole Anglo-American occultist tradition. Now, we're going to be talking more about theosophy and Rosicrucianism, so stay tuned for that. And Lewis developed a lust for the occult that remained with him even after he returned to Anglicanism.

He said, quote, And that started in me something with which, on and off, I have had plenty of trouble since, the desire for the preternatural, simply as such, the passion for the occult. The passion for the occult, C.S. Lewis said. Not everyone has this disease. Those who, have, will know what I mean. I once tried to describe it in a novel. It is a spiritual lust, and like the lust of the body, it has the fatal power of making everything else in the world seem uninteresting while it lasts. Okay? C.S. Lewis said, he had such a passion and lust for the occult, he couldn't give it up. Lewis said that he had, that he described that lust for the occult in a novel.

It occurs in the third book of the science fiction trilogy, and that book would be called That Hideous Strength. A man is in the process of being initiated into an inner ring of scientists who are occultists. They worship demons, which they call macrobes, huge powerful invisible things, as opposed to microbes, which are tiny invisible things. Here's a quote from the book. Here, here, surely at last, so his desire whispered to him, was the true inner circle of all, the circle whose center was outside the human race, the ultimate secret, the supreme power, the last initiation. The fact that it was almost completely horrible did not in the least diminish its attraction. And then it continues, these creatures, demons, breathed death on the human race and on all joy.

Not despite this, because of this, I'm sorry, not despite this, but because of this, the terrible gravitation sucked and tugged and fascinated him towards this. Never before had he known the fruitful strength of the movement opposite to nature, which now had him in its grip, the impulse to reverse all reluctances and to draw every circle anti-clockwise. From that hideous strength, page 269. Okay, so, like I said earlier, some were trying to say that he was warning against this, this type of thing, this, this inner circle, running things, kind of like the World Economic Forum, whatever, and then technocracy. But, that theory starts to fall apart when you see what he was into and the people he was associated with and what they were into. None of that makes any sense, whatsoever.

Note that Lewis said that he had trouble with that lust for the occult ever since his encounter with the matron in his boy's school. He wrote that statement in 1955. By then, he had written all but three of his books. Lewis dedicated his autobiography, Surprised by Joy, to B. Griffiths. We're not going to go more in depth with that guy. That guy was a Catholic, Benedictine monk, and a lot of crazy stuff with that guy. But, if you want, you can click that link and go check that out. A former student of his who became a long-time friend. Griffiths founded a Christian ashram in India. He said that Hindu temples are a sacrament. And he said, no one can say, in the proper sense, that the Hindu, the Buddhist, or the Muslim is an unbeliever.

I would say, rather, that we have to recognize them as a broad-spectrum as our brother in Christ. So, B. Griffiths said that. And, C.S. Lewis dedicated his autobiography to B. Griffiths. What B. Griffiths did and said is the logical conclusion of a statement that C.S. Lewis made in Near Christianity. He said, quote, There are people in other religions who are being led by God's secret influence to concentrate on those parts of their religion which are in

agreement with Christianity and do not belong to Christ without knowing it. Wrong. For example, a Buddhist of good will may be led to concentrate more and more on the Buddhist teaching about mercy and to leave in the background though he might still say he has believed the Buddhist teaching on certain other points.

Many of the good pagans long before Christ's birth may have been in this position. Okay? You know, it's so insane to me that, you know, Near Christianity is not recommended by so many modern day Christians and this quote is in that book. How the heck can they not read this and go, this is not the words of a Christian. It's not. Okay? This is someone who does not know the Gospel. Okay? Let's just be plain about that. Or they do and they've rejected it. Okay? Because he says, you know, people in other religions who are being led by God to concentrate on those parts of religion which is in agreement with Christianity, wrong. God doesn't do that. He causes them to turn from their idols to God.

And, you know, like a Buddhist he might focus on mercy and all this stuff. That doesn't do anything. He says the same thing about the pagans. He's basically saying they can be saved by their works. So, by trying to be a good person. That's what C.S. Lewis is teaching. Now, how in the world is that considered a, you know, how in the world, because the biggest group that are promoting this guy are evangelical Christians. Even though he is quoted by Catholics and other people, Orthodox Christians. But, evangelicals could say, could look at that and not see plain as day that he's teaching works salvation. And, that you can, that pagans and Buddhists can be saved by trying to be a good person.

Even though the Bible says, not by works of righteousness which we have done but according to his mercy he saved us. For by grace are you saved through faith and that not of yourselves it is the gift of God not of works lest any man should boast. Ephesians 2, 8, 9. C.S. Lewis is directly contradicting these scriptures. And, he's promoting a universalism where Buddhists and pagans are saved. Let's continue. Lewis said that he was strongly influenced by George McDonald. We're going to talk about him next. Who was a universalist? Oh, there you go. McDonald's book, Lilith, we're going to look at that, is based on an occult teaching that Adam was married to a demon named Lilith before he married Eve. By the end of McDonald's book, Lilith is redeemed.

And, Adam says that even the devil will eventually be redeemed, saved. Alright, so let's take a look at this book, Lilith, by George McDonald. Talk a little bit about George McDonald. Here's a couple quotes. Kurt Brunner Berthing Narnia. Lewis would credit George McDonald with having influenced virtually every word he ever wrote. It began with Fantastus, a dreamlike tale in which a boy wishes to visit fairy country. He awakes the next morning in an enchanted wood where he encounters profound happiness mixed with perilous adventure, including death and rebirth of sorts. And so, thanks to the imagination of George McDonald, C.S. Lewis found his way home. Here's another quote from the book Lilith by George McDonald. When God created me, Adam, not out of nothing, as say the unwise, but out of his own endless glory, he brought me in angelic splendor to be my wife.

There she, Lilith, lies, for her first thought was power. She had so ensnared the heart of the great shadow, Satan, that he became her slave, wrought her will, and made her queen of hell. Vilous of God's creatures, she lives by the blood and lives and souls of men. Now, I don't know if you guys understand, this is written by a witch. Straight up, George McDonald is writing exactly how a witch would write, talking about Lilith. This is what witches teach. It's pure occult teaching. That's all it is. C.S. Lewis never hit his fascination with the mystical fantasy. Seventeen years after his supposed conversion to Christianity, he wrote the following

endorsement of Lilith in other books by George McDonald in his 1948 book, George McDonald in the Anthology. Okay, guys, just this alone just blows the whole idea of who C.S. Lewis was apart. What Christian would ever endorse a book called Lilith? Especially considering what was written in the story. But let's look. You know how bad it was? C.S. Lewis said, I regarded George McDonald as my master. Unreal, huh? I regarded George McDonald as my master. Indeed, I fancy I have never written a book in which I did not quote from him. I mean, could you offer any higher praise of someone? So, George McDonald regarded as his master the man who wrote the book Lilith. Let's continue. Introducing McDonald Lewis wrote this. He, George McDonald, was born in 1824.

In 1850, he received what is technically known as a call to become the minister of a dissenting chapel in Arundel. By 1852, he was in trouble with the deacons for heresy, the charges being that he had expressed belief in a future state of probation for heathens and that he was trained with German theology. What he does best is fantasy. Fantasy that hovers between the allegorical and the mythopoeic. This, in my opinion, he does better than any man. It must be more than 30 years ago that I bought the Everyman edition of Fantasties. A few hours later, I knew that I had crossed a great frontier. I had already been waist-deep in Romanticism and likely enough at any moment to flounder into its darker and more evil forms, slithering down the steep descent that leads from the love of strangeness to that of eccentricity and thence to that of perversity.

Nothing was at that time further from my thoughts than Christianity and I therefore had no notion what this difference really was. I was only aware that if this new world was strange, it was also homely and humble. That if this was a dream, it was a dream in which one at least felt strangely vigilant. That the whole book also had about it a sort of cool morning innocence and also, quite unmistakably, a certain quality of death, good death. What it actually did to me was to convert, even to baptize. That was where the death came in, my imagination. It did nothing to my intellect nor at that time to my conscience. He said, what it did to me was to baptize my imagination. And one more quote from C.S. Lewis.

The quality which had enchanted me in his imaginative works turned out to be the quality of the real universe, the divine, magical, terrifying and ecstatic reality in which we all live. These are C.S. Lewis quotes introducing the Lilith book. On the opposite page across from C.S. Lewis's name in the introduction to MacDonald's book, readers will find a second title page and a short revealing quote from the Kabbalah. Here's the quote. Lilith, a romance.

Off Lilith, the Kabbalah. That's not surprising. The Kabbalah is based on occult myths that twist biblical truth into horrendous lies. In this mystical realm, Lilith was the first wife of Adam, a rebellious fallen angel. She plays that demonic role in this dark disturbing book, which we don't recommend anyone write. Hidden from the public eye for centuries, the mysterious Kabbalah has more recently entered the religious marketplace. In 18th, 19th, and 20th century Europe, and to a lesser extent in America, Kabbalistic mysticism mingled with medieval alchemy and hermetic teachings. In the

late 19th century,

Kabbalah in the world. It was the most popular religion in the world. It was the most popular religion in the world. It was the most popular religion It was the most popular religion in the world. was of the popular religions in the After the

Reascension of about that. Hegel, a lot of people don't know, Hegel came up with the Hegelian dialectic thesis plus antithesis equals synthesis and pitting opposites against each other to get a blended outcome. Well, he was actually into the occult. This never-ending process of merging opposites in order to produce unity or consensus is transforming churches as well as schools and business. It's evolving synthesis of opposites, whether they appear as conflicting realities or simply good and evil, is illustrated in MacDonald's Lilith. Okay, here's a quote. Lilith is the first text to employ the idea of going through a mirror into another world. Where else did we see that? In Alice in Wonderland, in The Matrix, it's put in multiple different books and movies. But Lilith is the first to employ that.

Lilith is a figure of myth, Adam's first wife, in the fulcrum of the narrator's ambiguous journey. Tensions of human and animal, good and evil, body, spirit, angel, vampire, play through the text, finally emerging in a violent conflict. Alright, Lilith Fulton, George MacDonald. Alright, so, that was the excerpt about Lilith. And if you want to read more about Emanuel Swedenborg and all that stuff, you can go down. The writings of George MacDonald were inspired by Emanuel Swedenborg and you can read all about that, the occultist, who influenced him, you go all the way down, there's a ton of information. We're going to move on to the next section. Alright, let's continue on. This, well, before we continue on, actually, yeah, let me read that. This universalism shows up in some of Lewis's fiction books.

In The Great Divorce, Lewis is in heaven. He speaks with George MacDonald and asks him about universalism. And MacDonald answers that Lewis cannot understand such things now. In the last of the Narnia books, The Last Battle, a pagan makes it to heaven, Aslan's land, because of his good works and his good motives. Again, salvation by works. In spite of the fact that he did not believe in Aslan and he worshipped Aslan's enemy, a false god named Tash, who's the devil. Okay? It's unbelievable. It's the stuff that's just so in your face. So, a pagan who worshipped the devil as represented by Tash, because Aslan represents Jesus, Tash represents the devil, false god, makes it into heaven. Why would C.S. Lewis put that in his book? It doesn't make any sense.

Lilith shows up in the Lion, the Witch, and the Wardrobe. Mr. Beaver tells the children that the White Witch is descended from Lilith, who is the first wife of Adam. This could cause confusion, especially for children. Although Mr. Beaver is a fictional character, he is speaking authoritatively about the real world, the real Adam and Eve of the Bible. Right? So, it causes so much confusion. And so, that was about that guy, George McDonald's book, Lilith. Why was you know, C.S. Lewis called him, I regarded George McDonald as my master. I'm sorry, that is just astounding to me. He regarded him as his master. This guy who wrote a book called Lilith. Okay, so that's one big one. Next, we're going to go to, we're going to take it to a whole other level with the next guy.

And these guys are part of this literary society called the Inklings that Lewis was a part of. Okay, this guy, Charles Williams. There was Owen Barfield, Charles Williams, Tolkien, who wrote the Lord of the Rings series, and C.S. Lewis were all part of this group called the Inklings. Now, Lewis spoke very highly of Charles Williams and his books and, so I read all his books, the person that wrote this article. They are novels that mix darkness and occultism with some insights about Christianity. In the greater trumps, the hero is a saintly woman who saves the day by doing magic with tarot cards. Again, this is another person C.S. Lewis is friends with, and they are really into the occult. Williams was such, was as much a mixture of as his books were.

He started out as a serious occultist. He believed theosophy and other occult teachings. And he joined the Golden Dawn. That's right. The Hermetic Order of the Golden Dawn. A group that practices sex magic, which is ritual fornication that is done for the purposes of getting occult power. The notorious Satanist, Aleister Crowley, was a member of the Golden Dawn. Yes, that is correct. Williams left the Golden Dawn later, after a couple years, and joined the Anglican Church, but he kept some of his theosophical beliefs. He kept quite a bit. Okay, so we're going to read about that, but Charles Williams, yes, he did join the Golden Dawn and he was friends with C.S. Lewis. So let's take a look more about that. Charles Williams.

Now, if you want more about these guys, there's a book called The Inklings. See? C.S. Lewis, J.R.R. Tolkien, Charles Williams, and Their Friends by Humphrey Carpenter. Okay, so a couple points here. C.S. Lewis called Charles Williams a man whose mind was steeped in occult rituals and demonic forces his dearest friend. This close friendship made an impact on Lewis and his writings, especially on fantasies such as That Hideous Strength. Again, which was supposed to be some people are saying, a warning against technocracy and all those evil stuff. Which doesn't make any sense. When someone that was in the Golden Dawn had an impact on the book. Second part below, excerpts from The Inklings shows the dark nature of Charles Williams' beliefs and writings. Alright, so let's go.

From the Narnian, The Life and Imagination of C.S. Lewis by Alan Jacobs. Pages 196-198. Alright, so check this out. Charles Williams. This is where we're taking it to a whole other level. From the Narnian. Perhaps the most interesting person among the Inklings was one

of the temporary members of the party, Charles Williams. An odd and charismatic man, he wrote plays, poems, short and long, including a sequence based on an Arthurian legend. Works of literary criticism and theological treatises. But Williams was chiefly known for his novels, often referred to as supernatural thrillers. They include black masses, magical tarot cards, the crown of King Solomon, an antichrist, and dead people who can speak with the living. Also known as necromancy. Now, already sounding great, isn't it?

A reader of Williams' biography is likely to come to the conclusion that he was rather creepy. His romantic theology, which understands erotic love not so much as a path or ladder to the love of God, but as a form of the love of God, encouraged him to flirtations. Williams was married, but that didn't stop him. Now, basically what this is, you know, referring to is that fornication magic that we're talking about. He seems to have had the same sadomasochistic tendencies as the young C.S. Lewis, though without ever escaping them. His fascination with the occult exceeded what most Christians think of as appropriate bounds, yet few who knew him saw him in this light. Lewis adored him. C.S.

Lewis adored Charles Williams, finding him chivalrous, generous, even selfless, as well as a major thinker and a brilliant, though often too obscure writer. I begin to suspect that we are living in the age of Williams, he once wrote in a letter to his friend, and our friendship with you will be our only passport to fame. The poet W.H. Auden, who worked with Williams on a collection of poetry he edited for Oxford University Press, had perhaps a stronger response. Many years after first meeting Williams, he would recall that interview in surprising terms and mark it as one of the events that led him to embrace the Christian faith. Quote, He's talking about Charles Williams. I had met many good people before who had made me feel ashamed of my own shortcomings, but in the presence of this man, I did not feel ashamed.

I felt transformed into a person who was incapable of doing or thinking anything base or unloving. I later discovered that he had a similar effect on many other people. Very strange, right? How could a conversation about literary business generate such an aura of personal sanctity? Williams simply made an exceptionally powerful impression on almost all who knew him, though in more variable ways. Williams and Lewis met by exchanging fan letters. In 1936, Lewis had read Williams' novel, The Place of the Lion, and was so taken with it that, for the first time in my life, he said, he wrote a fan letter to the author. Almost immediately, he received a reply from Williams explaining that he had been just about to write a similar letter to Lewis after reading the proofs of The Allegory of Love.

Williams had remained in Oxford, continuing to work for the press, but also giving occasional lecture series for the university and, of course, meeting with the Inklings. Until his sudden unexpected death in May of 1945, Lewis was devastated by the loss. More than any other of the Inklings, the member of the Golden Dawn, Williams had effectively displaced Tolkien from his place in Lewis' life. Indeed, he called Williams in a letter written soon after the man's death, my dearest friend. Now, check this out. Now, we'll see the dark stuff that Charles Williams was into. And, we saw how close C.S. Lewis was to Charles

Williams, so there's no denying that. Excerpts from The Inklings, that book. Here's some quotes that are very eye-opening.

A fundamental element in Charles Williams' character, the thing that he was trying to express when he told a friend, at bottom, a darkness has always haunted me. What was this darkness? By the time he was in his late twenties, he was making some study of the beliefs and practices of the semi-magical branch of Christianity known as Rosicrucianism. An occult system using a blend of Egyptian and Christian symbols. During this period, he read books by the Rosicrucian writer A.E. Waite, Arthur Edward Waite. He entered into correspondence with Waite, and at Waite's invitation was initiated in 1917 into an organization called the Order of the Golden Dawn. Okay? So, this is a fact. Charles Williams was super into Rosicrucianism. He found A.E. Waite, who was writing books about Rosicrucianism, and then he A.E.

Waite initiated Charles Williams into the Order of the Golden Dawn. That's a fact. So, that means someone who was a member of the Order of the Golden Dawn, the same secret society that Alistair Crowley was a part of, which we'll read in a second, the same person C.S. Lewis said was my dearest friend. My dearest friend. Alright, let's continue. Among its first initiates was a coroner who allegedly performs necromantic rites. Talking to the dead. While another early member was black magician Alistair Crowley, a self-styled great beast. But the Order of the Golden Dawn also included persons of less outlandish ways, such as William Butler Yeats, whom Williams met during the period of his membership, one or two clergy with a taste for the mystical, and A.E.

Waite himself, it was this group that Williams joined. Now, I think we'll read more about that later. Alright, let's continue. As a neophyte aspiring to be initiated into the Golden Dawn, he would apparently have had to declare, quote, my soul seeking for the light of occult knowledge, we're not going to read all of the oath, but it says that, seeking for the light of occult knowledge, he also had to take, an oath to keep the rites secret. Now, I'm going to tell you something. Please make sure you don't click off this, because later, I'm going to read to you from someone who said, in modern day times, who said that they were raised in the Golden Dawn, and he tells you exactly what they were into.

He lays it all out more clearly than anyone I've ever seen. Alright, so let's continue. He also had to take an oath to keep the rites secret on penalty of a hostile current which would be set against him if he broke faith. Yeah, basically he would be cursed if he tried to spill any secrets. Okay? They always have these oaths that they have to take. That if you tell any of the secrets, you're going to get in trouble. And the higher up you go, the steeper the penalty. On penalty, the hostile current which would be set against him if he broke faith. Probably they were harmless enough, they were not harmless, based as they seem to have been on Waite's enthusiasms for Freemasonry, vaguely Christian mysticism, and Rosicrucianism, a system of occult beliefs which combines the symbolism of Christianity with the terminology of alchemy.

It's a demonic counterfeit of Christianity. Yeah, exactly. Waite's own explanation of Rosicrucianism comes as near to lucidity as does any account on this opaque subject. Well, like I said, I have a more detailed one later, but. The cross is the sign or the symbol of the brotherhood and its inward dedication of pure mystical wisdom. Its red color represents the mystical and divine blood of Christ. There is placed in its center a rose of the color of blood to indicate the work of sacred and divine alchemy. From Arthur Edward Waite, Brotherhood of the Rosy Cross, page 107. All right, so you can go look at that. Certainly, membership of the Golden Dawn involved the performance of rituals which we're not even going to be able to they won't even especially in that book, The Inklings, they're not going to tell you exactly what they did.

They did some crazy stuff. But, of course, it's not going to be written about here. But they were involved in the performance of rituals which Williams, with his love of writing ceremony, entered into wholeheartedly. He had always taken care to learn by heart the words of any Golden Dawn writer. He memorized, okay? This wasn't just some guy who dabbled. Charles Williams memorized by heart all the Golden Dawn rites. There does not seem to have been anything in Waite's Temple of the Golden Dawn which was opposed to Christianity. Yeah, right. Everything there was opposed to Christianity. Yeah. Indeed, Waite, who had been brought up a Catholic, believed his practices to be part of what he called the secret tradition of Christianity. Oh, man, that opens up a whole other can of worms.

The tradition that, besides the overt meaning of Christian doctrine, there was also a hidden series of truths revealed only to the elect few. Waite remarked that this Gnostic tradition, apparently of his temple, it is not in competition with the external Christian churches. Waite also made a special study of talismans and of tarot cards. These and other details of occult knowledge were to play a major part in Williams' novels. Right. So, all this super detailed occult knowledge, that Charles Williams learned in the Golden Dawn and being associated with all these people, he put into his novels. And then, T.S. Lewis said, he's like his dearest friend. Now, that whole thing where A.E. Waite was saying that the practices, he was brought up Catholic, but he believes his practice would be part of what he called the secret tradition of Christianity, like the Rosicrucianism and Golden Dawn and stuff.

Well, well, well, well, there is some truth to that about Catholicism, other religions, that they usually have an exoteric outer shell of where most people are familiar with the explanations and meanings of things. And then, there's an inner core, esoteric core, where they have, like they say, the secret tradition, different meanings of symbols, and that there's hidden series of truths revealed only to a few, where it's a smaller number of people, kind of like, you know, there's Islam in general, right? But then, the esoteric core of that is Sufism. And there's a lot of different versions of that stuff. But within Catholicism, there's a lot of secret traditions in there. We could talk about, you know, Knights of Malta, Jesuits, equestrian order of the Holy Sepulcher of Jerusalem, and all these other types of things, but there's always that exoteric, esoteric version of it.

And what they say, basically, is that they give, Albert Pike, the Freemason, said this one

time, that, you know, to people that are of lower degrees, we tell them one explanation for a symbol, but as you go up higher and higher in rank, then you tell them the real meaning of the symbols. The esoteric meaning. All right, let's continue. The next sentence refers to the Kabbalah. In one of Waite's books, he also encounters the sacred tree of the Sephiroth, a symbolic diagram based on Jewish mystical Zohar. Right, the Kabbalah based on the Zohar. Read a little bit more and then we'll move on. Perhaps, too, William's developing notions of human love as a ladder to God owed something to Waite's account of the concept of marriage in the Zohar, which pictures the nuptial union on earth as a type of and path or approach to the mystical union in heaven.

And it was maybe also from Waite's writings that Williams acquired some of his knowledge of black marriage. Magic. Whatever the source is, by the late 1920s, Williams was thoroughly acquainted with the terminology and practices of black magic. To him, it was as valid a form of symbolism as the symbols of Christianity. Didn't matter to him. That's why they don't believe in good and evil. They say they're beyond good and evil, right? No one can possibly do more than decide what to believe, says a character in one of his novels. And that was exactly what Williams himself thought. He had decided to believe in Christianity, but it was a conscious choice. And he practiced a lot of other things.

So though he, Williams, soon outgrew the Golden Dawn and left the Order, the symbolism and the knowledge of the occult that he acquired during his membership remained valuable to him, not least because in its extreme form, black magic was the polar opposite of Christianity. And his mind was always drawn to an awareness of the opposite pole of an argument or belief. All right. And then, let's see here. We're just going to, I think we'll stop there. I think there's one more thing I wanted to read. Well, you can read the rest of that too if you want. There was one more thing down here. Oh yeah, right here. About that hideous strength. One may legitimately wonder what influenced the Golden Dawn had on C.S. Lewis and Tolkien via Williams, Charles Williams.

Certainly, that hideous strength, which is the third novel in the science fiction trilogy by C.S. Lewis, certainly that hideous strength is universally acknowledged to have been greatly affected by Lewis's acquaintance with Charles Williams, the member of the Order of the Golden Dawn. His description of the company of St. Anne's is certainly evocative of Williams' companions of the co-enhancers from afar off. It carries, therefore, also the mark of the Golden Dawn. Tolkien was a cultural Catholic, deeply read in both folklore and pre-Reformation literature. These were themselves suffused, albeit more or less unconsciously, with the magical or hermetic worldview of which, after all, the Golden Dawn was only one exponent. The hermetic, neoplatonic worldview has come to be commonplace throughout fantasy literature, but developments in such areas as depth psychology and the new physics suggest it may indeed have a validity beyond the pages of fiction.

Okay? So, the point here is I wanted to show that it was clear that the Order through Charles Williams and the Golden Dawn had an impact on C.S. Lewis writing that book, The Hideous Strength. Okay? So, to say that that's warning against evil and technocracy is so

absurd. When he was involved with that. All right? So, let's move on to the next section. That's enough with Charles Williams. Okay. So, next subject. Okay. Lewis also had a close friend named Owen Barfield. He dedicated the Narnia books to him and named Lucy after Barfield's daughter. Barfield was a philosopher who started out with Theosophy. and developed his own version of it. Over and over again we see Theosophy. We'll get into that in a second. But let's look at Owen Barfield, the last guy we'll look at.

And, again, some excerpts from that book, The Inklings. Philosopher Owen Barfield. Of all the Inklings, the group of Oxford scholars that met regularly to discuss Christianity and mythology in the early 1900s, one of the least often memorialized on the net is Owen Barfield. Okay? Okay. Now, let's look. Legacy of the Second Friend by Dale Nelson. Take it from that article. Many people who look into the writings of Owen Barfield are C.S. Lewis admirers who are curious about this man who was Lewis' close friend throughout his adult life. From 1919 to Lewis' death in 1963, Barfield was Lewis' legal and financial advisor. Very close. And became executor of his estate. Lewis dedicated his first scholarly book, The Allegory of Love, to Owen Barfield. To the wisest and best of my unofficial teachers.

Stating in its preface that he asked no more than to disseminate Barfield's literary theory and practice and dedicated the first Narnian Chronicle to his friend's adopted daughter, Lucy. In his autobiography, Surprised by Joy, Lewis portrayed Barfield as the second friend. The one who never fails to challenge one and prod one to new understanding. Another sign of Barfield's thought in Lewis appears in the third lecture, The Abolition of Man, where Lewis suggests that Dr. Steiner, meaning Rudolf Steiner, the founder of Anthroposophy and of the occult Waldorf schools, which Barfield embraced as a young man, may have found the way to a redeemed scientific method that does not omit the qualities of a deserved object. By the way, this is years after C.S. Lewis' supposed conversion. But more about Barfield.

Barfield raised in an agnostic family was baptized and became a member of the Church of England only in late middle age. However, he retained the anthroposophic beliefs of his personal Switzerland theosophy he had begun to learn while a young man. Rudolf Steiner's occult science seemed to be a modern Gnosticism complete with reincarnation. Christ and Jesus as two separate beings, a fall engineered by Luciferian beings to promote man's ascent to his own his destiny of spiritual freedom. Yeah. You could go down a rabbit hole about Rudolf Steiner. Like I said, we're not going to do that today, but if you go look into that guy, again, super well-known occultist. We'll continue on. Reincarnation. All right, let's see what Owen Barfield believed about that.

In keeping with the teaching of anthroposophy, Barfield espouses his belief in reincarnation on several occasions. Indeed, reincarnation is essential to the to his understanding of the evolution of consciousness. In Unancestral Voice, the Megid, which is a spirit being in Barfield's book, elucidates reincarnation for virgin. Quote, it is only through repeated earth lives, he explains, that mind could gradually and as a historical process become more and more individualized. That is to say, could gradually emerge from the spirit which gave birth

to it. But the Western understanding of man's repeated earth lives, the Megid, foresees, is not to be confused with that of the Orient, for when at last it does awaken, it will be virtually opposite to the Oriental doctrine of reincarnation, for it will not, as the East has done, lay the whole emphasis on the period of life on earth, but will understand that the opposite pole,

the period purgatorial and celestial between death and birth, is of at least equal significance for the present predicament of the human soul, and it will seek to investigate that too. And secondly, it will though with a sober realization of the cost of suffering see rebirth as a thing to be sought rather than one to be avoided. Okay, again, this is called teachings, but he's pushing this reincarnation, repeated earth lives, having to live life over and over again. Owen Barfield, after reading English, at Wadham College, Oxford, he worked as a freelance writer for seven years. During that time, he was influenced by Rudolf Steiner, again, joined the Anthroposophical Society. So he actually joined the Anthroposophical Society, Rudolf Steiner's group. Apart from his brother, Morney Lewis, C.S. Lewis's best friend was Owen Barfield.

And from 1927, they went on three or four day walking tours together in the spring. His great-grandfather, his great contribution was to persuade C.S. Lewis and through him Tolkien that myth and metaphor has always had a central place in our language and literature. When he was working in London, he occasionally joined the Inklings when he came to Oxford. Barfield wrote a volume of essays, Romanticism Comes of Age, though he joined the Church of England about 1946, he continued to believe in reincarnation, which C.S. Lewis said no Christian could possibly believe in, but he did, and later wrote several books on Anthroposophy. He was into the occult. Again. Okay? Um, I think that's it here. One more quote. Evolution of consciousness studies in polarity.

Owen Barfield's thought ranges over many disciplines, reflecting his belief in the unity of knowledge. It's all in every part character. There is no early or late Barfield to accord in current fashion. He tells us emphatically in the interview with him that follows, just the same Barfield all alone. Same beliefs. All right. So that's it for Barfield. Again, he was another guy to the occult. So, Owen Barfield, Charles Williams, George MacDonald, why? Oh, why? Is C.S. Lewis just so happens to be friends with people into the occult over and over again? He was surrounded by them. And they weren't just acquaintances. He, out of his own mouth, said, Owen Barfield, my best friend. George MacDonald, my master. Charles Williams, he was dearest to me. Right? His dearest friend. Why?

Over and over again. Charles Williams was in the Order of the Golden Dawn. Why was C.S. Lewis surrounded by these guys? Why was he so close to them? Why did he connect with these guys? Why was C.S. Lewis So, so well. See eye to eye and all so many things. Yet he claimed to be a Christian. Doesn't make any sense. Now, if there were someone today who said that they're a Christian and all their best friends are witches and occultists and into secret societies and one of the same secret societies that Alistair Crowley was in, I think there would be a problem. You'd think that you would say, oh, there's something up

with that guy. There's something wrong with this guy saying he's a Christian and all his best friends are witches and occultists.

There's no problem with the occult. By the way, the reincarnation thing, Bible says, Hebrews 9.27, as it is appointed unto man once to die, but after this the judgment. You die once, then the judgment. There's no reincarnation, no reset button, no second chances. That's it. Die once, then the judgment. But anyways, let's continue on here. Now we're going to get into theosophy because, again, all these guys, Barfield was in theosophy, Charles Williams, George MacDonald into that. They were all into theosophy. Now, what is so significant about theosophy? Well, according to theosophy, the God of the Bible is a tyrant, and Lucifer, the devil, came to rescue mankind from him. Even this dark view of God shows up in C.S. Lewis' writings. Yes, it does.

Now, I'm going to read a little bit about what C.S. Lewis thought about, you know, how the theosophical views kind of showed up in his writings, but then I'm going to show you someone, I'm going to show you a very clear explanation of theosophy, then Rosicrucianism, and the Golden Dawn, and the Kabbalah, so you understand when it references, you know, George MacDonald and Owen Barfield and Charles Williams and theosophy and Golden Dawn and all this other stuff, when they were into those things, you understand exactly what they were into. And then you understand the significance of C.S. Lewis being friends with them and endorsing them. And that's going to wrap up the whole teaching. Okay, so the ending is going to be I think the most significant part to tie it all together and drive the point home.

Alright, so according to theosophy, God abides as a tyrant, and this showed up in C.S. Lewis' writings. After his wife Joy died, C.S. Lewis wrote A Grief Observed, a book describing his thoughts and emotional struggles as a result of her death. The dark theosophical view of God shows up in this book. As shown in the following quotations. Supposing the truth were God always vivisects. Is it rational to believe in a bad God? Anyway, in a God so bad as all that, the cosmic sadist, the spiteful imbecile? C.S. Lewis calling God the cosmic sadist, the spiteful imbecile. Does that sound like a Christian to you? Lewis didn't stay there. He vacillated between despair and hope, but in his moments of agony and despair, the theosophical view of God came back to haunt him.

I don't know if it came to haunt him or he put it in there. Again, he put the, it's one thing to have thoughts pass through your head, but then to write them down and put them in a book and edit that book and publish it with those views of God, then there's something wrong. There is another problem with his messages. I've read all of his books and I do not recall any reference to the authority of God. And to the timelessness of his ways. Lewis's worldview seems to be based primarily on human feelings, wants and perceptions, including evolution and Freudian psychology. There's some more about that, but let's, you know what? Let's skip that. Let's go right to the theosophy. Let's take a look at that, okay?

Now we're going to go into this part. Now, the person I'm about to quote is, well, I got

another explanation. Before I quote this guy. But I am going to quote a man named Roger Williamson. And this man he's a Luciferian sorcerer, a long-time occultist. He was raised in the tradition of the Golden Dawn and all that stuff. And he was actually in, he founded an occult bookshop in Minneapolis called Magus Books. And years ago I preached in front of that bookshop. And I did some research on this guy. I found some interesting quotes that he revealed about his beliefs. Openly said this stuff. And I documented all this so that we have a nice modern day example clearly explaining what they actually believe in the occult.

And so then when you hear someone was into these types of things, the Golden Dawn, you know what it really means. So let's continue. Roger Williamson, occultist, author. He was the author of many books but one of them was Lucifer Diaries. And then he gave a presentation to the Minneapolis Theosophical Society in November 2005. I've included it here because I feel that it describes in concise language my philosophy is represented by the images of the Tarot of the Morning Star. He made his own tarot card deck, Roger Williamson. Now here I just jump into an explanation of theosophy. Okay, this is important to understand that. So when you hear about theosophy, you hear about H.P. Blavatsky, you hear about Annie Bessant, you hear about any of these people, you will understand what that means, what they really believed.

And all these other guys associated with C.S. Lewis. So let's deal with the theosophy. Elena Petrovna Blavatsky heralded the dawn of the New Age movement. Her writings are the foundation for many occult fraternities. After publishing monumental works such as Isis Unveiled and The Secret Doctrine, the Theosophical Society in 1875 was formed to spread her teachings worldwide. She claimed to receive her revelations from secret chiefs or disembodied ascended masters who claimed to be aiding humanity evolving into a race of supermen. Freemasonry took notice and many soon proclaimed her an occult genius, such as Manly Palmer Hall, the 33rd degree freemason and Masonic historian, which he says, The secret doctrine and Isis Unveiled are Madame Blavatsky's gifts to humanity and to those whose vision can pierce the menacing clouds of imminent disaster.

It is no exaggeration to affirm that these writings are the most vital literary contribution to the modern world. No more can they be compared with other books than can the light of the sun be compared with the lamp of the glowworm. the secret doctrine assumes the dignity of a scripture wow Manly Palmer Hall, 33rd degree Freemason from the Phoenix, an illustrative review of occultism and philosophy, 1960 the philosophical research society, page 122 now that's some pretty high praise about her books another interesting note the supposed truther who exposed supposed to expose conspiracy and stuff Jordan Maxwell there's a clip of him endorsing Blavatsky's books and saying that they're great books he recently passed away I believe but he is on video endorsing that just so you know alright let's continue Blavatsky soon had a great host of admirers the Theosophical Society because we're going to get into their beliefs the Theosophical Society had Freemasons Henry Steele Olcott, George H.

Felt appointed president and vice president respectfully among the early members were high ranking Masons, Charles Southern and Albert Pike that's right Albert Pike a member of the Theosophical Society in 1907 Annie Besant became president of the Theosophical Society the beginnings of the modern New Age movement began with the search for their own Messiah as it were along with 33rd degree Mason C.W. Leadbeater Annie Besant promoted a young adept as a Messiah Jiddu Krishnamurti yeah now that's a whole other crazy story and they went around touring around the world with this kid saying he's the new Maitreya world leader Messiah it was crazy Alice Bailey and husband Foster 32nd degree Freemason continued to interlock the workings of theosophy with the aims of Freemasonry Bailey as founder of Lucius Trust it wasn't called Lucifer it used to be called

Lucifer Publishing Company not Lucifer Trust so that's a mistake that some people make who research it used to be called Lucifer Publishing Company then it was changed to Lucis Trust obviously they wanted to take out the name Lucifer so Bailey as founder of Lucis Trust worked laboriously to fulfill the plan toward a new world religion which her master Dwal Kul someone demonic entity that she channeled had said was the ultimate aim of Freemasonry the hierarchy had blessed both their beginnings her master said now let's look at this is what we really want to get to Levaki's view of Satan this is the theosophical view of the devil alright so let's take a look at that these are direct quotes from Levaki she said this Lucifer represents life, thought, progress, civilization, liberty, independence Lucifer is the Logos the serpent the savior then you get the pages secret doctrine volume 2 you can go look those quotes up yourself she said Lucifer is the savior

starting to get an idea of what theosophy really is sympathy for the devil throughout the secret doctrine Levaki praised the devil and belittled God in volume 1 Cosmogenesis she wrote quote the devil is now called darkness by the church whereas in the Bible he is called the son of God she's just called the son of God the devil the bright star of early morning Lucifer see Isaiah there's whole philosophy of dogmatic craft and the reason why the first archangel who sprang up sprang from the depths of chaos was called Lux or Lucifer now Lucifer actually isn't an archangel he is called an anointed cherub in the Bible that's a different category of an angelic being but let's continue was called Lux the luminous sun of the morning or

manvantaric dawn he was transformed by the church into Lucifer or Satan because he is higher and older than Jehovah and had to be sacrificed to the new dogma ok so Blavatsky said Lucifer is higher and older than Jehovah can you get more blasphemous than that Blavatsky went on to hail Satan as savior of man Satan she said quote Satan and his rebellious host would thus prove when the meaning of the allegory is explained to have refused to create physical man only to become the direct saviors and the creators of divine man Satan for instead of remaining a mere blind functioning medium impelled and guided by the fathomless law the rebellious angel claimed and enforced

his right of independent judgment and will his right of free agency and responsibility since man and angel are alike under karmic law she's talking about the devil for her Satan is the

one who frees man from death quote thus Satan once he ceases to be viewed in the superstitious dogmatic unphilosophical spirit of the churches grows into the grandiose image of one who made of terrestrial a divine man basically over and over again making man god which is what Lucifer actually said if you eat of the tree of knowledge you shall be as gods but anyways image of one who made of terrestrial a divine man who gave him throughout the long cycle of maha kalpa the law of the spirit of life and made him free from the sin of ignorance hence of death so she's saying Satan freed mankind from death from ignorance from all these things that he's a savior in volume two

anthropogenesis Blavatsky continued to exalt the devil she said quote Satan will now be shown in the teaching of the sacred doctrine allegorized as good and sacrificed a god of wisdom under different names Blavatsky added in this case it is but natural even from the dead letter standpoint to view Satan the serpent of judgment in Genesis as the real creator and benefactor you hear what she said it is natural to view Satan as the real creator benefactor the father of spiritual mankind for it is he who was the harbinger of light bright radiant Lucifer who opened the eyes of the automaton created by Jehovah as alleged and he who was the first to whisper in the day ye eat thereof you shall be as Elohim knowing good and evil only

and only be regarded in the light of a savior again calls the devil a savior an adversary to Jehovah the personating spirit he still remains in esoteric truth the ever-loving messenger the angel the seraphim the cherubim who both knew well and loved still more saying the devil loved and who conferred on us spiritual instead of physical immortality the latter eternal life the kind of static immortality that would have transformed man into an undying wandering Jew okay so she's saying Satan loved us and since he loved us he gave us knowledge saved us from death freed us almost done here heading towards the end of these quotes in the end Blavatsky raises up Satan as the highest divine spirit to make the point clear once and for all that which the clergy of every dogmatic religion preeminently the Christian points out is Satan the enemy of God is in reality Satan the highest divine spirit

occult wisdom on earth in its naturally antagonistic character to every worldly evanescent illusion dogmatic or ecclesiastical religion included thus the Latin church intolerant bigoted and cruel to all who do not choose to be its slaves the church which calls itself the bride of Christ and the trustee at the same time of Peter well talking about the Catholic church she's correct about that that they're fake to whom the rebuke of the master get thee behind me Satan was just the address and again the Protestant church which while calling itself Christian paradoxically replaces the new dispensation of the old law of Moses which Christ openly repudiated no both these churches are fighting against divine truth when repudiating and slandering the dragon of esoteric wisdom okay so she said it doesn't matter if it's Catholic or Protestants she says that Christians

who are fighting against the truth when they repudiate and slander the dragon of esoteric wisdom when they slander the devil for her in antiquity in reality Lucifer or Luciferus is the

name of the angelic entity presiding over the light of truth and last quote the logical consequence of these beliefs is that for Blavatsky the fall was a result of man's knowledge for his eyes were opened indeed he was taught wisdom and the hidden knowledge of the fallen angel for the latter had become from that day his manus mind and self-consciousness and now it stands proven that Satan or the red fiery dragon the lord of phosphorus brimstone was a theological improvement and Lucifer or light bearer is in us it is our mind our tempter and redeemer our intelligent liberator and savior from pure animals okay so wow

now I mean that is just to me insane that we have so many quotes from Blavatsky overwhelming quotes of her praising the devil saying the devil's good the devil's the savior he freed us from death gave us knowledge the devil loves us the devil's good and Jehovah's bad all this stuff and what were the Owen Barfield and Charles Williams and McDonald and all these guys into theosophy right here one last thing let's hear about Blavatsky's hatred for Christian churches Blavatsky's proclamation of universal brotherhood did not extend to Christians and their churches no of course not not universal brotherhood everyone except Christians in 1877 she said that ISIS unveiled was in particular directed against Christians

and their churches theological Christianity the chief opponent of free thought it contains not one word against the pure teachings of Jesus yeah right it's twisting but unsparingly denounces their debasement into pernicious ecclesiastical systems that are ruinous to man's faith in his immortality and his God and subversive of all moral restraint we cast our gauntlet at the dogmatic theologians who would enslave both history and science and especially at the Vatican we cast our gauntlet she really did hate the Vatican and especially the Jesuits we'll talk about that another day but whose despotic pretensions have become hateful to the great portion of enlightened Christendom now you know different factions within Satan's kingdom fight with each other that's something you've got to understand but anyways in 1888 Blavatsky reiterated the secret doctrine must someday become the just karma of the churches more anti-Christian than the representative assemblies of the most confirmed materialists and atheists so she was no fan of Christians absolutely hated them so having said all that how is it

that all these guys these inklings could be followers of a philosophy created by a woman who literally exalts the Christian the devil as the savior hates Christians and yet C.S. Lewis is supposed to be a Christian friends with all these guys something's not making sense guys not making sense now let's finish the teaching with Roger Williamson's speech to the Theosophical Society a couple quotes here where he talks about the golden dawn Rosicrucianism and the Kabbalah so that you understand when we were talking about that earlier when we were referencing those things this gives you a little bit more insight into what he's talking about so back to Williamson's speech from to the Theosophical Society listening to this presentation you might feel that it doesn't relate to its title Angel of Light however I consider the Angel of Light Lucifer to be a dynamic life principle and not a historical or mythological figure to me Lucifer is a geometric function a life principle which

we all possess it opens the door to other realms

of reality encouraging to us us to lead a fuller and more creative lives so he had no problem with Lucifer and apparently the Theosophical Society had no problem with this speech either my background is one of ceremonial magic as practiced by the golden dawn okay so he tells you right here this guy was raised in it by his mother actually he admits in another part that he was raised by his mother into magic and he says ceremonial magic as practiced by the golden dawn so if anyone would know what the golden dawn was into and they believed it would be this guy and he says the golden dawn founded in 1888 was in some ways a reaction by its founders to eastern philosophy flooding into England and at the time by its citizens returning from the colonies the founders of the golden dawn wanted to offer a western tradition to balance the influx now look at this he explains the golden dawn like this

the core of the golden dawn system is the Hebrew QVL or Kabbalah QVL is a the Kabbalah is a Hebrew word that translates as to receive it is a system of attainment that classifies diverse forms of energy it is a vehicle for obtaining altered states altered states of consciousness and for communicating with entities which may not be of this earth universe or dimension okay now this guy says the core of the golden dawn system is Kabbalah and he says Kabbalah is a vehicle for communicating with entities not of this dimension there are many who believe that the origin of the Kabbalah has its roots in Egypt and the Tigris and Euphrates Valley Babylon right the Babylonian Talmud goes all the way back there and remember that the Jews were captives in Babylon at one time

places visited by the Hebrews in the course of their history it is therefore an eclectic yeah exactly they were slaves in Egypt also for 400 years it is therefore an eclectic philosophy thanks to its diverse roots now let's hear what he has to say about golden dawn and Rosicrucianism the golden dawn was greatly influenced by the Rosicrucian manifestos published anonymously by Johann Valentin and Dry between 1610 and 1612 okay so he says golden dawn was influenced by all these different things first of all first he says Rosicrucianism then he says the works of Dr. John Dee court astrologer to Queen Elizabeth the first of England who was he was he found he founded something called the Noccian magic the works of Eliphas Levi the French Magus who claimed to have summoned to a visible appearance the spirit of Apollonius of Tyana Francis Barrett the author of the Magus a compendium of magical technique and philosophy published in 1801 and Lord Bulwer-Lytton I talked about him before he wrote about the Vril

the author of Zanoni who had the reputation of being a Rosicrucian added to this were their translations of medieval grimoires and diverse forms of divination all of these traditions were fused into a coherent system using the Kabbalah as its unifying structure he's saying all this to say this is what the golden dawn was made out of their beliefs golden dawn work in its most basic overview consists of two functions ritual and astral workings the ritual creates the gateways into other dimensions earths the energies of these dimensions and makes them tangible it is from these other dimensions astral realms that are wells of power

that the magician slash shaman derives his or her empowerment okay so he says the golden dawn consists of opening gateways into other other dimensions and then taking energy out of these dimensions for the magician themselves getting power from other dimensions which you're opening gateways to

these astral realms are very now you know what's interesting he says now think about this the ritual creates gateways into other dimensions right and you get energy from those other dimensions now we were looking earlier at this book called Lilith by George MacDonald and C.S. Lewis said George MacDonald was as my master and in the book Lilith it's the first text to employ the idea of going through a mirror into another world what's Roger Williamson say golden dawn ritual comes from it creates gateways into other dimensions now do you see the connection and guess what you think it's any different in the Narnia books well guess what happens the lion the witch and the wardrobe they go through the wardrobe into another world another dimension

same thing earth's energies these astral realms have a very ethereal plastic nature much like a dream and so gleaning coherent substance requires a reliable structure of reference for the testing and clarification of his experiences this is the role of the Kabbalah this conscious ability to tap diverse forms of energy be empowered by them and to cleanse our sense of perspective I call magic in my own work I replaced the word ritual for that of machine to remove the technique from religion and machine is a system that converts energy from one form into another a vehicle of transformation machines can be used to transport people or things from one place to another communicate with other life forms and shape or transmute materials magic is a machine that is used to transport you from one place or dimension to another communicate with other life forms and shape and transmute you Roger Williamson communicate with other life forms being spirits from another dimension okay so

that's I'm going to read you one last Bible verse at the end but that pretty much is the end of the teaching now let's talk about a few things it's undeniable C.S. Lewis's fascination with the occult he said to himself it's undeniable he was very close friends and admired these friends George McDonald Charles Williams Owen Barfield and others and he said he endorsed their writings like love their writings were filled with the occult and even in real life they were into this isn't just fantasy you can't just write it off and say it's all fantasy and in novels because Charles Williams was actually in the order of the golden dawn Owen Barfield was into anthroposophy was associated with Rudolf Steiner these guys were into theosophy in real life they actually were into the stuff in real life and then all they did was put their beliefs into their books and guess what so did C.S.

Lewis because he was surrounded by them okay and you can't have all these guys be your best friends and you're not into the same stuff it's absolute garbage and he even admitted he was into the occult now we might not have a formal record that C.S. Lewis was initiated into the golden dawn or O.T.O. or Rosa Crucian or anything like that that doesn't matter he's surrounded by those guys he understands all the concepts and he put it in his books

and then guess what he gave the books to children and they taught the children occult concepts and magic that's all it is now these books actually we can't really even talk about it even how much more crazy it is but to those that have a little bit maybe an understanding of the what I'm talking about there's also connections with Lewis Carroll Alice in Wonderland there was a connection with that dude

and if you understand anything about those books Alice in Wonderland Wizard of Oz and what those books have been used for and those types of things then you can understand that the Chronicles of Narnia books were used for the same type of things now if you know you know but continuing on here C.S. Lewis is was into the occult and friends with occultists and that is a fact and that would not that would mean not a Christian now I can do a whole other show where I talk about all kinds of quotes where he outlines his beliefs and there's so many things that go against the Bible all kinds of heresies and false doctrine and we might do that but for right now this is enough to blow the whole thing apart the mythology that you have in your mind of C.S.

Lewis about who he really was and let me show you exactly who he was remember that Roger Williamson mentioned Angel of Light Lucifer as an Angel of Light well the Bible has something to say about that 2 Corinthians chapter 11 verse 13 for such are false apostles deceitful workers transforming themselves into the apostles of Christ and no marvel for Satan himself is transformed into an angel of light therefore it is no great thing if his ministers also be transformed as ministers of righteousness whose end shall be according to their works no marvel don't be surprised don't be shocked for Satan himself is transformed into an angel of light to deceive right he doesn't come with a pitchfork and horns looking ugly he transforms into an angel of light to appear as good and the Bible says just like Satan does that so do his apostles false apostles that Satan's ministers are transformed as the ministers of righteousness just like C.S.

Lewis minister of Satan transformed into minister of righteousness we give you the evidence today of who that man really was and I hope you see you've got to get far away from those books you've got those books get them out of your house get them those books and those movies away from your kids immediately and don't look back and it'll be a really good thing that you do and will be helpful alright so that's it for today hopefully that was helpful to you I'm not trying to intentionally make you mad and to hurt you just bring in the truth that's it and if you respond to the truth if you repent if you humble yourself if you accept it then it will help you it will not hurt you alright thank you for watching please like, share, subscribe, comment check out the description below for all the associated links God bless you have a good day.

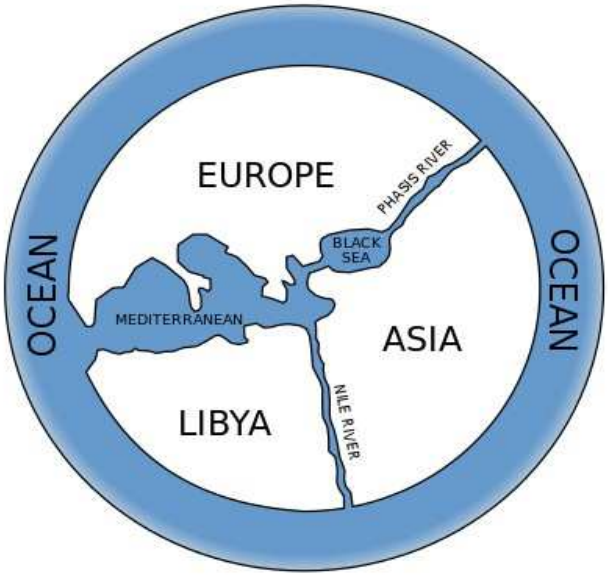
African circumnavigation by Africans

Carthaginians discover Mount Cameroon, the Ugandan tin Phoenicians sold in Europe
Two thousand years old African lighthouses in the Mediterranean and North Atlantic

Introduction

African navigators circumnavigated their continent around 600 BCE.
That is two thousand one hundred years before that belated crossing by Portuguese Europeans that brought to the rapid and organized economic demolition of Africa's Indian ocean trade, in the age of colonization European history schoolbooks still call “age of explorations”.

This is no conjecture or colonialism avenger's fantasy. It happened and was historically recorded. To start with, by no other than Herodotus, one of the founders of historical research methodology, in a near contemporary age. He had access to the direct recorded memories and notes of those who were witnesses of the first African full circumnavigation we are aware of. Most likely, the first ever.



Philosopher Anaximander's (601 - 540 BCE) world map **Hecateus's map (550 – 476 BCE). Circumnavigability of Africa was not in doubt. By their age, it had been realized by Pharaoh Necho II, probably as an attempt to surround Babylon**

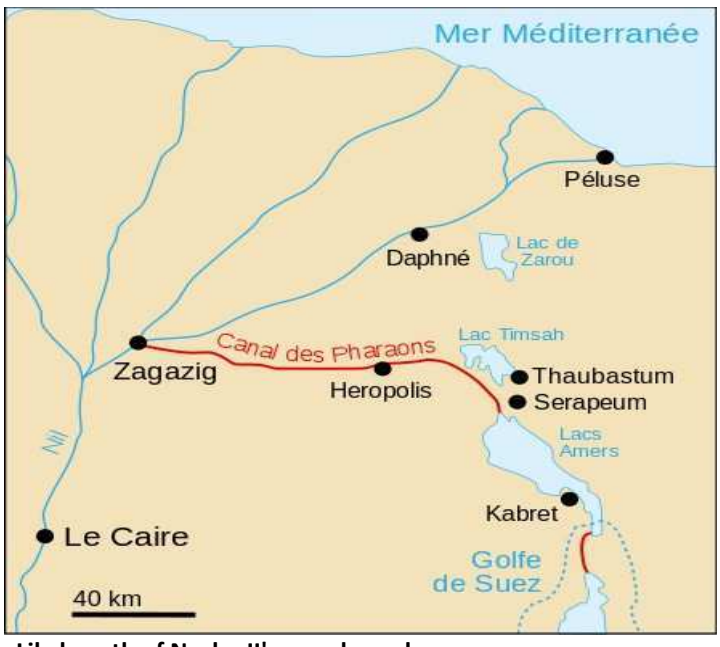
1 Herodothus on Pharaoh Necho IIs' expedition

Necho II reigned from c. 610 to c. 695 BCE. His were times of trouble, as a great challenge came from Babylon. The Babylonians had conquered the whole of Assyria, practically, with just one Assyrian general, Ahur Uballit II, an ally of Egypt, holding still, by retreating on the banks of the Euphrates.
As Necho got to power, he sent a first mission to support him, but failed. The next or the very year he sent a stronger army, that found serious resistance in Josiah, king of Judah, a Babylon ally then.

The 609 BCE biblical battle of Megiddo brought to the death of the King of the Israelites[1].

Tel al Megido from the air. The site of one of the most recalled Biblical battles. Wikimedia commons

During his Syrian campaign, Necho II attempted one of the most pharaonic infrastructure project of antiquity, prior to the grandiose realizations of Han China: dig a navigable canal, from the Pelusiac branch of the Nile to the Red Sea.
Necho's Canal was the earliest precursor of the Suez Canal. In connection with the excavation works he founded the new city of Per-Temu Tieku, 'The House of Atum of Tieku' at the site now known as Tell el-Maskhuta, just west of Ismailia.
The waterway was intended to facilitate trade between the Mediterranean Sea and the Indian Ocean. And command control of the North Red Sea to prevent a Babylonian attack from sea. Rather, prepare a fleet to subjugate his arch-rivals in the middle east.



Likely path of Necho II's grand canal

It was not just a mere option, a project was drawn, and excavations started. Aristotle and Strabo indicated that the project could be older, initiated at the time of Senusret III in ca. 1850 BCE. To Pliny the Elder, Senusret had already dug for miles, thirty metres wide and ten deep[2]. It is reported as surely completed only later, at the time of of Darius the Great, but fully functional only after Ptolemy II erected a lock to avoid the salt water of the lakes spoil the Nile, as they lay a few metres higher. This before the digging of the Suez canal, which let the great bitter lake flow to sea level. Ptolemy II's engineers are thus accredited for the invention of the water tight canal lock[3].

A bronze figure likely to represent Pharaoh Necho II, wikimedia

Necho did not give up because the enterprise was deemed impossible, but because his advisers warned him the canal could have offered the Babylonians the easiest access way to his power house in the Nile delta. He most probably never completed the feat, thirty miles of canal, so he likely did not realize there was a gradient down the Great Bitter Lake towards the Nile, via the excavated Wadi Tumilat.

"*Necos (Necho), then, stopped work on the canal and turned to war; some of his triremes were constructed by the northern sea, and some in the Arabian Gulf* (the Red sea), *by the coast of the Sea of Erythrias. The windlasses for beaching the ships can still be seen. He deployed these ships as needed, while he also engaged in a pitched battle at Magdolos with the Syrians, and conquered them; and after this he took Cadytis (Kadesh), which is a great city of Syria. He sent the clothes he had worn in these battles to Branchidae of Miletus and dedicated them to Apollo*".[4]

He imagined then, still believing that his victory could finally come by surrounding the enemy, to perform the encirclement by following the coast of Africa. One geographical conception of the day saw Africa's coast along the Red Sea close back onto Asia, much as in Claudius Ptolomaeus, the Hellenistic writer's Geography. So, following Africa's oriental coast may mean, possibly, being able to attack Babylon from the back[5].
Whatever the outcome, as costly exploration in antiquity is rarely if at all the product of a will to know *per se,* this is the most logical reason behind his mission across Africa.
Necho invested heavily in the expedition. He enrolled the best navigators of his time, the Phoenicians, who already formed the backbone of his naval forces.

The best seamasters served the most successful world powers.
The Pharaohs, Black Africans, used the clear complexioned Phoenicians, while the Roman resorted to Ethiopia's sea power and ports.
One thousand years after Necho's circumnavigation of Africa Rome-Byzantium used the Axumite skills to challenge Persia in the Indian ocean trade.
When the trade to the "Indies" -the East African coast, India and China essentially- was so vital Rome was progressively abandoned to permanently move Roman power to Byzantium, and send to India one hundred and twenty ships a year from the single port of Myos Hornos[6], in the time of Augustus, at the beginning of our Common Era.
Seas' trade is the place where battles for the survival of world economic powers are won and lost, since immemorial. So it came that when Persia won that trade war, in the VII century CE, Rome-Byzantium declined and with it Axum, their African staunch ally[7]. The distant inheritors of that Ethiopian might, the recently recovered Barara based Emperors of Ethiopia received a Portuguese voyager-cum-spy, Pero da Covilha, and impeded him from going back to Portugal. Pero had been sent by politicians in Lisbon who did not believe that the Columbus way to the Indies -via the Atlantic ocean- was viable. He had already managed to inform widely his Court on the feasibility of the cross to the Indies via East Africa, via Jose' Sapateiro, sent exactly to look for him. And seek that vital information. This was in between 1488, when Bartolomeu Diaz reached the tip of South Africa, and that fatidic 1496 Vasco da Gama expedition to India via the tip of Africa[8]. At the birth of a new world order based on unequal trade, tied to the false first circumnavigation of Africa.
One common tract unites the first, African circumnavigation and the first European one: geopolitical pursuits, not sheer exploration. A need to defeat a powerful enemy, Venice on the spice route for Portugal, Babylon in the middle east, not to be invaded soon, for Kemet Egypt.

Herodotus left us a precise account of the pharaonic first circumnavigation. His page close when, after three years of navigation, the expedition reached Egypt via the strait at Hercules' pillars, today's Gibraltar. He had a doubt, which today only confirms the circumnavigation was actually complete. He could not accept that the sailors had, in west Africa, the rising sun and the coast on the same side. Which is exactly true instead -and logic to us now aware of the shape of the continent-

for the whole of west southern Africa.

“As for Libya, we know it to be washed on all sides by the sea, except where it is attached to Asia. This discovery was first made by Necos, the Egyptian king, who on desisting from the canal which he had begun between the Nile and the Arabian gulf (the Red Sea), sent to sea a number of ships manned by Phoenicians, with orders to make for the Pillars of Hercules, and return to Egypt through them, and by the Mediterranean. The Phoenicians took their departure from Egypt by way of the Erythraean sea, and so sailed into the southern ocean. When autumn came, they went ashore, wherever they might happen to be, and having sown a tract of land with wheat, waited until the grain was fit to cut. Having reaped it, they again set sail; and thus it came to pass that two whole years went by, and it was not till the third year that they doubled the Pillars of Hercules, and made good their voyage home. On their return, they declared- I for my part do not believe them here, but perhaps others may- that in sailing round Libya they had the sun (raise) upon their right hand. In this way was the extent of Libya first discovered”[9].

1.1 Black Africans first Circumnavigated Africa, no other

Kemet is the self given name of the grandest organised historical civilisation of early antiquity.
In ancient Egyptian it means Land of the blacks, much like Ethiopia means land of the Black (or burnt faces) in Greek and Sudan comes from Bilad al Sudan, the Arab for exactly the same name. Black as a distinguishing character, powerful enough to name a Country. A lesson of pride, I would guess, for those who feel a handful of centuries of Euro-Caucasian race predominance gibberish might have left us less assured. However, this statement has met controversy.

Kendall cites the stelae of Piye, the founder of the Meroitic Dynasty, as a justification for the sires of Napata and Meroe deep in present day Sudan to conquer the whole of Egypt, generating its most grandiose land extension period. Its inscription states that "Amun of Napata granted me to be ruler of every foreign country," and "Amun in Thebes granted me to be ruler of the Black's Land (Kemet, KMT)”[10]. Amun was Piye's protecting God, as typical of the Kush, or Nubian Kingdom. Defining his, the XXV as the “Black African” dynasty is senseless. It should be rather the Kush Dynasty, as Kush was a separate and long dated kingdom, not an undefined periphery of Kemet, when it took control of Egypt. Precisely, of the Land of the Blacks.

“Ancient Egypt was a Negro civilization. The history of Black Africa will remain suspended in air and can not be written correctly until African historians dare to connect it with the history of Egypt. In particular, the study of languages, institutions, and so forth, can not be treated properly; in a word, it will be impossible to build African humanities, a body African human sciences, so long as the relationship does not appear legitimate. The African historian who evades the problem of Egypt is neither modest nor objective, nor unruffled; he is ignorant, cowardly, and neurotic. Imagine, if you can, the uncomfortable position of a western historian who was to write the history of Europe without referring to Greco-Latin Antiquity and try that off as a scientific approach.[11]”

Pankhurst concludes that is it hard to distinguish Ethiopia, Nubia and Egypt in antiquity, as its peoples were in substance the same[12]. I would add, with a gradient of genes that appear to vary North to South, and, within North Africa, from West to East.
Culturally though, circumcision, headrests, hair styles really are the same along the Nile.
To the Greeks and Romans, Egypt was an African country, and their artists depicted the Egyptians as Africans, with black skin and tightly curled hair, described by the Greek historian Herodotos in the fifth century BC as 'woolly'.
A list of Greek contemporary historians that, with no exclusion, mention their sea faring rivals and neighbours of Kemet as black Africans, like the word itself states, Herodotus, Strabo and Diodorus

Siculus included:

1. to Herodotus a wealthy and respected Greek oracle was known to be from Egypt because she was "black", and he regarded the natives of the Nile region as "black with heat", as the Egyptians were "black skinned with woolly hair".[13]
2. Lucian observes an Egyptian boy and notices that he is not merely black, but has thick lips.[14]
3. Diodorus Siculus mentioned that the Aethiopians considered the Egyptians a colony.[15]
4. Apollodorus calls Egypt the country of the black footed ones.[16]
5. Aeschylus, a Greek poet, wrote that Egyptian seamen had "black limbs."[17]
6. Greeks at times referred to Egyptians as Aethiopians.[18]

Modern-day dictionary compilers appear to shun the debate on black or white Kemet, confirming, as the UC Santa Barbara academic Dr. Stuart Tyson Smith that Ancient Egyptian blackness may be accepted by US present race standards, admitting there is a wide variety of “black Africans”.
I find this intelligent and not “old school”. Though the statement is based on a rather disturbing concept: the US has criteria to distinguish race, as it was law that race -to me an anachronistic concept in itself- appeared years ago on all US citizens ID (sic!). He is an authority on Nubia-Ancient Egypt relationships.
Tyson Smith in the 2001 Oxford Encyclopedia of Ancient Egypt: "Any characterization of race of the ancient Egyptians depends on modern cultural definitions, not on scientific study. Thus, by modern American standards it is reasonable to characterize ancient Egyptians as "black", while acknowledging the scientific evidence for the physical diversity of Africans."

I would in fact stand by the “cultural definition” that there has been plenty of race-dominated debate, the product of colonial mindsets, and that Africans need to take a lead in unearthing, DNA testing, detailing in scientific terms and above all explaining their massive civilized past, in their own hands. Taking care not to fall in demential old colonial school pit traps: ancient Egyptians were Caucasians in good part and not Africans; this is a camitic, this a semitic “race”.
Fight a *Race* to rapidly free us all from racist preconceptions appears to me a must.
Some investment in Pride that would be worth the equal of the biggest dams, motorways or train lines installation being now essentially financed by Africans, like in present day Ethiopia.

I support Basil Davidson, a grand and honest defender of African tradition against colonial bias, who puts the matter -still largely controversial- in these terms:

"Whether the Ancient Egyptians were as black or as brown in skin color as other Africans may remain an issue of emotive dispute; probably, they were both. Their own artistic conventions painted them as pink, but pictures on their tombs show they often married queens shown as entirely black, being from the south: while the Greek writers reported that they were much like all the other Africans whom the Greeks knew.[19]"

With the c*aveas,* attention note if not all, some queens might have been foreign, that black is universally regarded as aesthetic, beautiful and, in Egypt, it was considered the colour of fertility, as associated with the Nile inundation and its fertile soils from Ethiopia. Recent DNA research does not solve unilaterally the question so far, but rather tends to show strains of different kinds in the little DNA that has so far been extracted pure enough from mummies, with so far yet inconclusive, and complex global origins for present day Egyptians. This is logical, as a number of peoples have repopulated Egypt since antiquity, including Persians, Romans, and above all Arabs.

As to early Egyptologists, including Francois Champollion, the Rosetta codebreaker, they had little doubt the Ancient Egyptians and present day Egyptian Arabs and Copts are quite different. With Kemet Egypt clearly indicated as an autonomous black African civilisation[19a].

Queen Ahmose Nefertari, of Ramses IV

Different peoples in Seti I tomb: Libians, Nubians, Persians, Egyptians

2 Hanno's African volcano. Carthaginians along West Africa's coast in the VI-V century BCE

Hanno, Carthaginian navigator, left in an unknown year prior to 500 BCE to explore the west coast of Africa. The Carthaginians already had colonies on the Atlantic coasts of today's Morocco and the Sahrawi territories.
The exact date and the circumstances of his feat are still unclear. Carthage was nearing the height of its maritime power, and soon later, or in the same period during the Vth Century Himilco, also from the Phoenician breakaway colony and Mediterranean sea superpower, was to explore the North sea.

Carthage dispatched Hanno at the head of a fleet of sixty ships to explore and colonize the north-western coast of Africa. He sailed through the straits of Gibraltar, founded or repopulated seven colonies along the African coast of today's Morocco as extended to the former Sahrawi republic, and explored significantly further along the Atlantic coast of the continent[20].

Part of the unbelievable of Hanno's recount is that he found an island populated with hairy savage people, as he described. Three females were captured and killed as they could not be kept at bay. Their skins were held in the Temple of Tannit on Hanno's return and, according to Pliny the Elder, survived until the Roman destruction of Carthage in 146 BC, some 350 years after Hanno's expedition[21] The interpreters travelling with Hanno called the people Gorillai (Greek Γόριλλαι). When European explorers first encountered gorillas in the 19th century, the apes were given this name on the assumption that they were the "people" Hanno had described.

> In its inmost recess was an island similar to that formerly described, which contained in like manner a lake with another island, inhabited by a rude description of people. The females were much more numerous than the males, and had rough skins: our interpreters called them Gorillae. We pursued but could take none of the males; they all escaped to the top of precipices, which they mounted with ease, and threw down stones; we took three of the females, but they made such violent struggles, biting and tearing their captors, that we killed them, and stripped off the skins, which we carried to Carthage: being out of provisions we could go no further.

If -as it appears- Hanno confused Apes and Men, Dutch and British settlers in the Cape Province in the XVII century, nearly two thousand and five hundred years later went chasing and killing KhoiKhoi and “Bushmen” fellow humans straight up to their huts, considering them as good as a variety of bothering, disturbing monkeys[22].

March 20th, 2016 saw the 100th year recurrence of the suicide of pygmy Ota Benga, ending one of the most absurd criminal cases of practical racism. He had been obliged to show his teeth and his body to paying visitors locked in a cage. He was kept there as a special monkey

amongst others on display, proof of “earlier stages of human evolution”, to generate prime revenue for the zoo at the orders of a scientific racist, Madison Grant, an eugenicist. He had been freed by a good thinking Pastor, on the evolved grounds that the exhibit was pro Darwinism, and thus “contrary to Christianity”. Ota shot his own heart when he learnt he could not go back to Africa due to the WWI travel restrictions. He had been -guess what, typical of monkeys- depressed after treatment received by his jailers, rather, zoo keepers[23]. Human zoos and the similar had been common in European culture, up to some sixty years ago, dubbed as “anthropological” shows. Anthropology and Ethnology are the unrelated terms commonly used up to today to sell colonial racist material of different sorts.

2.1 Hanno's voyage in the periplus account

The primary source for Hanno's expedition is a Greek *periplus*. A translation of a tablet text Hanno is reported to have hung up on his return to Carthage in the temple of Ba'al Hammon. The complete title translated from Greek is “The Voyage of Hanno, commander of the Carthaginians, round the parts of Libya beyond the Pillars of Heracles, which he deposited in the Temple of Kronos”d (Ba'al Hammon).

The text was translated imperfectly and somewhat incompletely. The abridged translation was copied successively by Greek and Byzantine clerks. Two copies exist, dating to the ninth and the fourteenth centuries.

The first of these manuscripts is the Palatinus Graecus 398, in the University of Heidelberg. The other text is in the Codex Vatopedinus 655, taken from the Vatopedi monastery, Mount Athos, Greece and dated to the beginning of the 14th century; the codex is now divided partly in the British Library and partly in the French Bibliothèque Nationale[24].

2.2 In Herodotus, Histories, book 4

Herodotus does not refer directly to the tablet at the Baal Hammon temple. He describes Carthage's trade with West African peoples in some detail, though.

“The Carthaginians tell us that they trade with a race of men who live in a part of Libya beyond the Pillars of Herakles. On reaching this country, they unload their goods, arrange them tidily along the beach, and then, returning to their boats, raise a smoke. Seeing the smoke, the natives come down to the beach, place on the ground a certain quantity of gold in exchange for the goods, and go off again to a distance. The Carthaginians then come ashore and take a look at the gold; and if they think it presents a fair price for their wares, they collect it and go away; if, on the other hand, it seems too little, they go back aboard and wait, and the natives come and add to the gold until they are satisfied. There is perfect honesty on both sides; the Carthaginians never touch the gold until it equals in value what they have offered for sale, and the natives never touch the goods until the gold has been taken away”[25].

2.3 In Arrian's account

Arrian of Nicomedia, Bythinia, was a Greek historian, public servant, military commander and philosopher of the Roman period. He lived from c. 86-89 CE to after 150. His multi-volume “Anabasis of Alexander” is considered the best account of Alexander's short and active period of

vast conquests

Arrian mentions Hanno's voyage at the end of his Anabasis of Alexander, book VIII (Indica):

> Moreover, Hanno the Libyan started out from Carthage and passed the Pillars of Heracles and sailed into the outer Ocean, with Libya on his port side, and he sailed on towards the east, five-and-thirty days all told. But when at last he turned southward, he fell in with every sort of difficulty, want of water, blazing heat, and fiery streams running into the sea[26].

This recount has one fixed point of interest to those seeing his journey reach Mt. Cameroon and possibly further South to Gabon: Africa's shoreline, effectively as described here finally turns South only after the whole of its West Coast, first in Nigeria to then do so until the Cape of Good Hope, from the Cameroon coast onwards.

2.4 In Pliny the Elder's account

According to Pliny the Elder, writing in the first century CE. Hanno started his journey at the same time that Himilco started to explore the European Atlantic coast. Pliny reports that Hanno actually managed to circumnavigate the Africa continent, from Gadiz to Arabia.[27]

A number of modern scholars have commented upon Hanno's voyage. In many cases, the analysis has been to refine information and interpretation of the original account. Trying then to correlate it to modern West Africa Geographical features. A hard task, as the Carthaginians actually hid, not published their geographical finds, to avoid direct competition with Greek traders in particular.

William Smith points out that the complement of personnel totalled 30,000, and that the core mission included the intent to found Carthaginian settlements.[28] Some scholars have questioned whether this many people accompanied Hanno on his expedition, and suggest 5,000 is a more accurate number.[29]

Considering true the number of sixty ships, the second is clearly a more accurate estimate. One twenty metres overall ship, akin to that wrecked earlier on the Turkish coast, the 16m Uluburun ship, would have lodged no more than 60 people. A few more if totally crammed. So 5,000 is even too big a number for sixty ships, filled to the brim, with little or no space for baggage, food water and armaments. Unless they were, still clearly possible, much wider and longer.

Harden states a general consensus exists that the expedition reached at least as far as Senegal.[30] Most agree he could have reached Gambia as there is no major volcano at all further north in Senegal. However, Harden mentions lack of agreement as to precisely where to locate the farthest limit of Hanno's explorations: Sierra Leone, Cameroon, or Gabon. He notes the description of Mount Cameroon, a 4,040-metre (13,250 ft) volcano, more closely matches Hanno's description than Guinea's 890-metre (2,920 ft), lowly Mount Kakulima. Warmington prefers Mount Kakulima, considering Mount Cameroon too distant, failing though to be categorical in his reasoning, either.[31]

Fifty three days of sailing could have taken Hanno to Cameroon, or just to Guinea: much depends on how many stopovers he made. The text left to us does not reveal enough on the length of his mentioned stays to definitely and certainly let one, or the other volcano be chosen with certitude as his final point of reach. Unless we take for correct Arrian's indication on the coast pointing finally South, then, Hanno certainly reached Mt. Cameroon.

Warmington suggests that difficulties in reconciling the account's specific details with present geographical data are consistent with classical reports of Carthaginian determination to maintain sole control of trade into the Atlantic.[32]

This report was the object of criticism by some ancient writers, including the Pliny the Elder, and in modern times a whole literature of scholarship has grown up around it. The account is incoherent and at times certainly incorrect, and attempts to identify the various places mentioned on the basis of the sailing directions and distances almost all fail. Some scholars resort to textual emendations, justified in some cases; but it is probable that what *we have before us is a report deliberately edited so that the places could not be identified by the competitors of Carthage*.

From everything we know about Carthaginian practice, the resolute determination to keep all knowledge of and access to the western markets from the Greeks, it is incredible that they would have allowed the publication of an accurate description of the voyage for all to read. What we have is an official version of the real report made by Hanno which conceals or falsifies vital information while at the same time gratifying the pride of the Carthaginians in their achievements. The very purpose of the voyage, the consolidation of the route to the gold market, is not even mentioned.

Necessarily secretive, badly translated and abridged as it was in Carthage, the Hanno travelogue has yet fascinated generations of scholars, and remains to us definite proof of a well prepared and sustained commercial exploration of West Africa, by Africans sailors and traders, over 2500 years ago.

A map of Hanno's Voyage in West Africa, wikimedia, modified by author to include Mt. Kakulima as a final destination

3 More Phoenician and Carthaginian feats

3.1 The Phoenician's Uganda tin voyage in some detail

“I will turn my hand upon thee, and purge away thy dross, and take away all thy tin” (Isaiah 1:25).

Tin in antiquity, before steel was produced in the middle east and inner African ancient Nations, even before, outsmarted all others in their ability with iron ores, was a vital commodity, due to the strategic value of Bronze. The first diffused use of metals we know much of began in the part of the Middle East that lies between the eastern end of the Mediterranean Sea, the Persian Gulf, and the Black and Caspian seas, and forms the boundary between Europe and Asia. It includes the mountainous parts of Turkey and Iran, northern Iraq and Armenia, Georgia, and Azerbaijan to the Caucasus Mountains. A vast mineral province that contains abundant copper, silver, iron, and other base metals, but only moderate amounts of gold and little tin. Tin was precious, like gold, in time of war in particular. Till the time of the Punic wars of Rome and Carthage and further.

The Phoenicians are thus credited for vast tin trade transactions that spanned from the Hebrides and the North sea to Africa. One confirmed source of Phoenician tin is Uganda.
This may appear unreal, as the later, Necho Expedition around Africa would be considered a total novelty already. Yet, it happened. Locals were mining tin that the Phoenician traded from Uganda. This is confirmed by the mineralogical analysis, including radioisotope types of bronze objects of ca 1500 BCE [33].
How Phoenicians would have obtained that tin can today only be the subject of speculation and conjectures. If it had happened through intermediaries, these were local people groupings, at least until the seaports. From then on, it could have been a local seafaring civilisation. The one the Chinese knew since the III century BCE as Zesan, Azania. As the logical ports would be on the East Africa side, and almost certainly in present day Kenya and Somalia, for its southernmost coast. With the Tana river as an ideal waterway to reach the interior.

Present day tree trunk boats on the Tana River, NE Kenya

Colonial attempts to make it navigable around 1880 hit the difficulty of its meanders and were substituted by the Mombasa railway, operative by 1906.

It was in antiquity easily navigable to barges and simple trunk boats, much as it is today, as a permanently flowing river of around 1000km course[34]. Its waters collect the melting seasonal snows of Mount Kenya. A 134m tall falls interrupts the course, near Embu, but South of it also its tributaries towards the lake Victoria side appear well navigable to barges from satellite views.

The Tana rive meanders, across from Garissa, the Kenyan Region bordering Somalia

What kind of research could bring us to understand the Uganda-Kenya-Somalia Phoenician trade is an absolutely fascinating question.
My choice would be sonar seabed scans of the Tana river delta. If an ancient barge or boat could be found preserved, ideally with some traces of its cargo, we would have a much clearer idea of the trade, absolute dating and origin of the boat's woods and, likely of the cargo.
Often times a quest, if carried out interdisciplinary with broad minded experts does also yield the unrelated, and the unexpected. Excavations, extremely expensive and possibly cost inflated, by Chinese and Kenyan archaeologists not far South of the Tana delta, in Mambrui, Malindi have yielded little trace[35], really much disproportionate to the economic effort, of Ming Chinese presence in the area. What if the quest of traces of Zheng-He's fleets or the scantily verified China to Azania ancient links since antiquity could be pursued in the mouth of the major nearby, abundant freshwater, and insidious river meanders and silts?

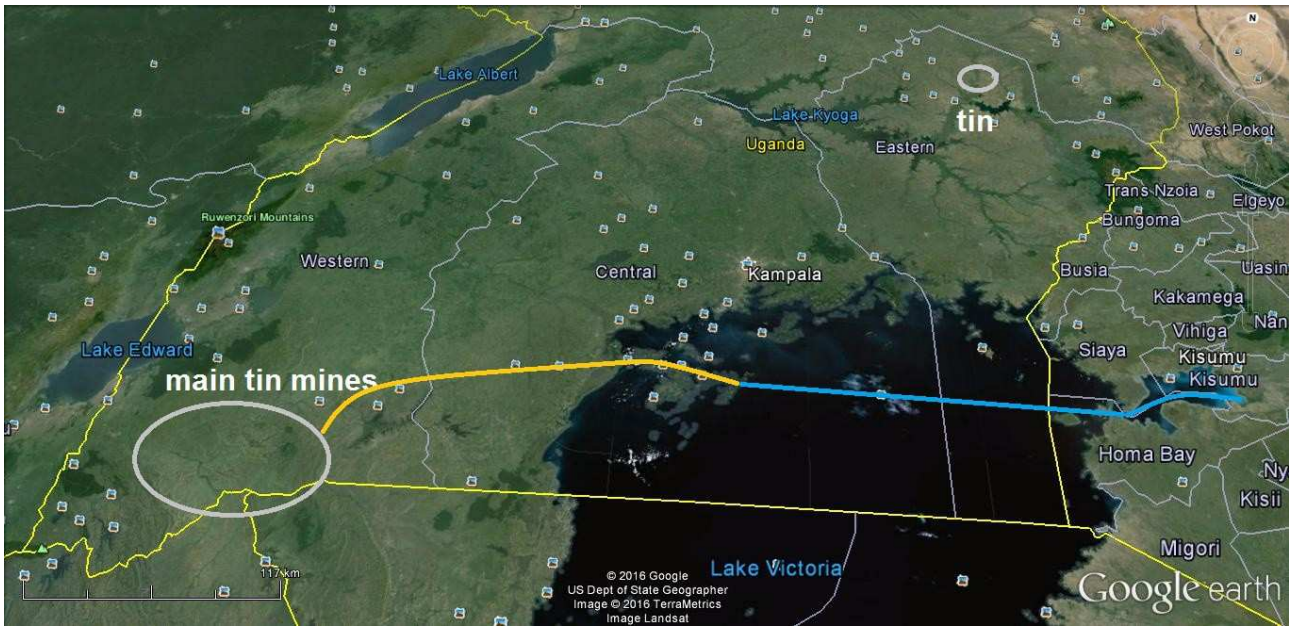
Another, slightly shorter but possibly less practicable route involves more land crossing, from the SW Uganda mines to the Pangani river mouth, in Northern present day Tanzania. The Pangani, much shorter, would have been equally easily navigable by barges or tree trunk boats. Or more sophisticated local boats. A third remote possibility would have implied seafaring the tin across the whole of the west African coast from the mouths of the Congo river, and over at least 700 km of forests and some 3000 km of navigable river. I would concentrate on the two preceding hypotheses.

How did the tin then reach the Mediterranean sea?
I would guess in either Phoenician mortise and tenon boats akin to the Uluburun wreck or in African sewn ships manned by the Zanj, the Zesan well known to the Chinese in the III century CE. Or made and manned by the Egyptians themselves.
While all three options appear to be possible technically, the chronology makes the second option more diffucult. The ships would have necessarily been assembled in the upper Egyptian ports, Myos Hornos, then S'w'w' (Sawawi? -now Gawasis), or Berenike Troglodita. There is no record of Phoenician ships, to the best of my knowledge, being assembled in Egypt, not prior to the Necho II expedition around Africa.
The Egyptians had regularly set sail in their own ships to the land of Punt since 2500 BCE or

earlier, as attested in the Saqqara site, in the time of Pharaoh Sahure. Gold from Punt is certified in the Kufu pyramid site, earlier. Solar boats attest the African sewn plank ships technology since 3100 as funerary ships from that period were unearthed in Tarkan, Saqqara and Helwan. But that appears a special event, not occurring for over a thousand years, apparently, after Sahure and before Queen Hatshepsut in 1550 BCE.

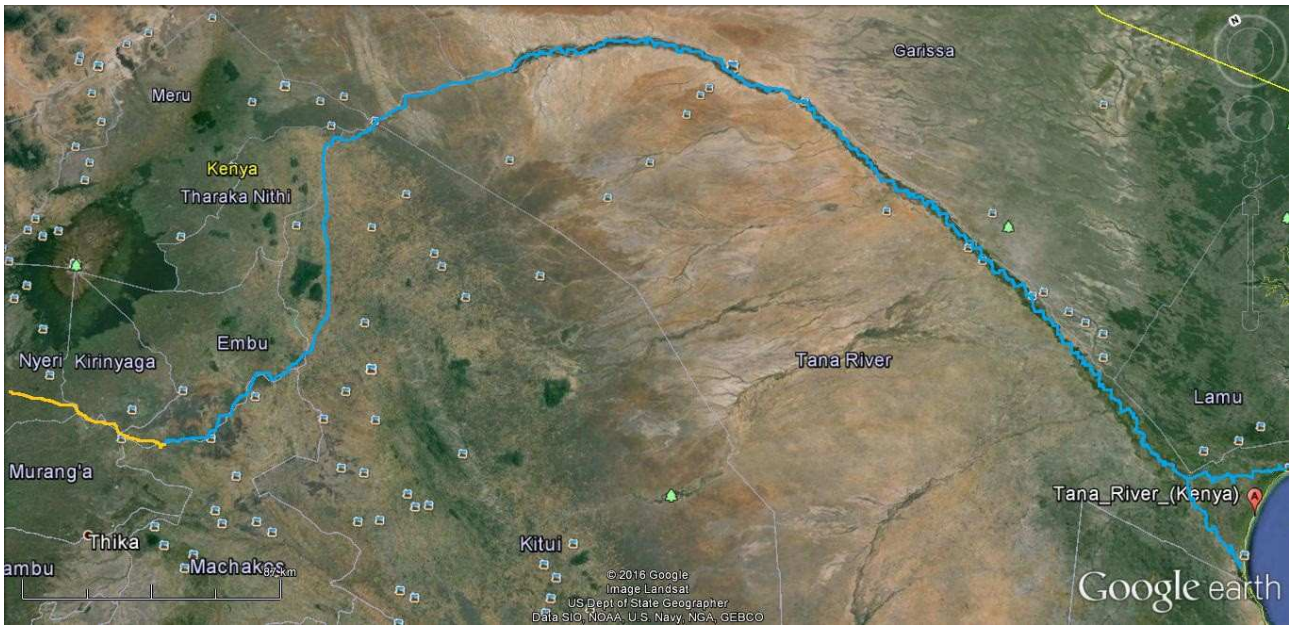
The last appears the most probable: at least the first part of the sea routes to the Mediterranean was undertaken in ships made, owned and manned by East African seamasters.

The Zanj. The earliest known East African navigators, were precursors of the Axumite ocean trade. Even though Kate Bard and Rodolfo Fattovich's discovery of major seagoing vessels in Marsa Gawasis, just South of present day Port Safaga, the Bay of Roman Myos Hornos, may well prove Egyptian Punt (approx. Eritrea), and further East African trade was no rare fact. The excavations have stopped since 2011 due to instability in Egypt[36].



Possible route from the main tin mines to Kenya, via the easiest way, Lake Nyanza (Victoria)
Source, remote sensing recognition and Uganda Government, National map of mining resources

Best route from lake Nyanza to the sea via the Tana river, yellow via land, light blue via waterways. p. I, to Mt. Kenya



p. II from South of Mt. Kenya, via the Tana River and its West tributaries, to its mouths North of Malindi

The original mines should be further analysed, to find the first man dug shafts, describe the technology and reconstruct the material artefacts of the mining culture. Satellite archaeology and drone surveys may help identify cultural contexts, sites along the typical routes from South West Uganda to Mount Kenya and to the sea, via the Tana river and its west tributaries. Potential ports along the Tana, in its marshy second half in particular could conduce to river bed scans and site recognitions there too. To find the boats, barges, navigation tools of this far fledged trade.

Not much, if anything has been studied and excavated of the prehistoric Azania ports, nothing at all of the internal trade routes and ancient mines.

A promising field open for those capable, and ready to understand and explain our powerful past.

Tin, 1500 km route from the Uganda-Rwanda border to the Azania coast North of Malindi and South of Lamu, sum of the previous figures with the addition of a S of Mt. Elgon to Mt. Kenya route for the Central Uganda lesser mines

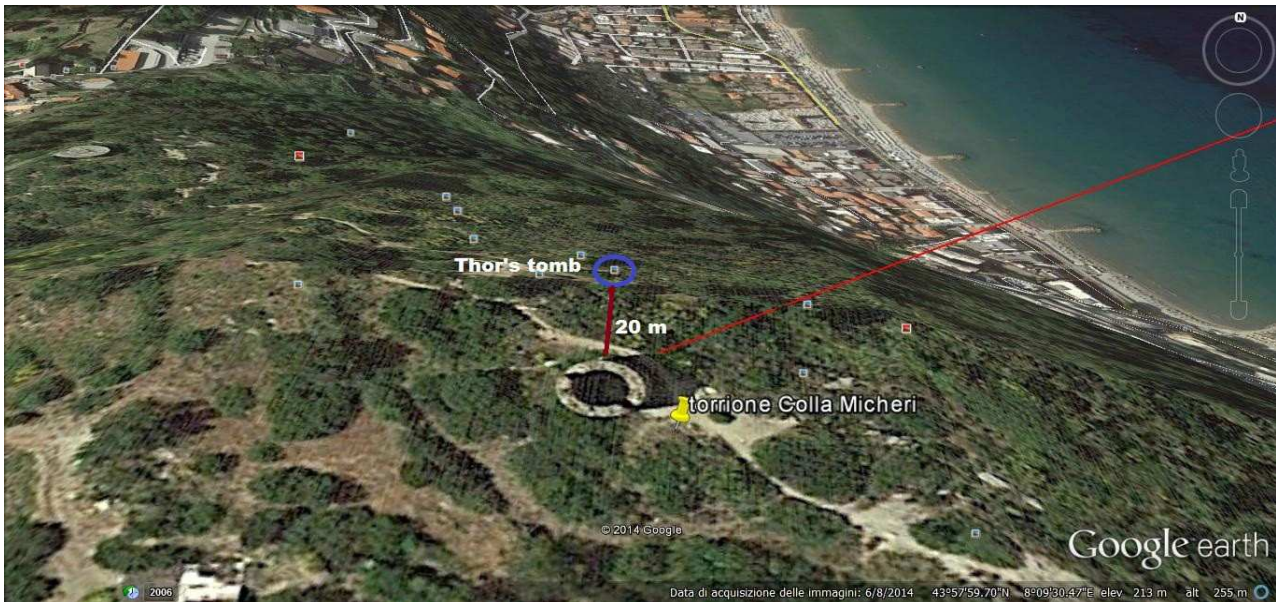
The alternative tin route to sea, via South Lake Nyanza across to S of Mt. Kilimandjaro, then via the Pangani river

3.2 Pharology: the disappearing light lighthouse. The most ancient "sectored" lighthouse.

3.2.1 Thor's Tomb lies in the shadow of a mysterious round tower

In October 2014, recurred the 100th anniversary of Thor Heyerdahl's birth[37]. Thor was the uncontested master of ancient navigation studies, and the creator of the concept of ancient boat seaworthy reconstruction.
Centering most of his reconstruction on ancient Egypt papyrus boats. Without knowing the seagoing ships of the Egyptians were a lot more solid. I wonder how he would have taken the discovery of Fattovich and Bard I mentioned in the chapter above. It would have made all his feats with boat replicas certainly less hard, considering the instability of papyrus reeds, and even more spectacular.

My reflection here starts from his tomb. I suspect those who built it might have used, with no knowledge, spolia, or reused stones from the basements of some ancient houses very near by, now totally collapsed, most likely tied to the "Colla Micheri tower", a structure erroneously locally indicated as a windmill.



An aerial photograph from Googleearth shows Thor Heyerdahl's tomb location, 20m North of the "windmill"

I have tried to demonstrate a tower on the opposing promontory across a vast Ligurian bay, at Verezzi, could not possibly have been a windmill at all, much like another one similarly indicated as an “horizontal axis mill”, located in La Spezia.
They were most likely lighthouses instead. The one facing the Norwegian navigator's tomb, on the long promontory of Cape Noli, the Verezzi tower, is perfectly sited to have its light disappear in case a Mediterranean ship was too close to the only dangerous island for three hundred nautical miles around, from Antibes to Isola del Giglio: Gallinara island.

Gallinara Island's cliffs. Deadly to ancient Mediterranean large, hard to steer ships

Displacing the tower at Verezzi just one hundred metres along the side of the promontory meant its light would no longer disappear, as a ship approached the cliffs of Gallinara.

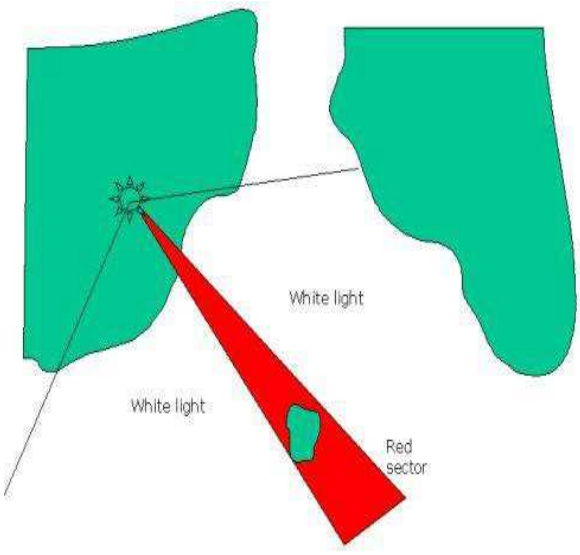
The 16 nautical miles wide long bay between capo Mele and capo Noli. The Verezzi tower is where it should be?

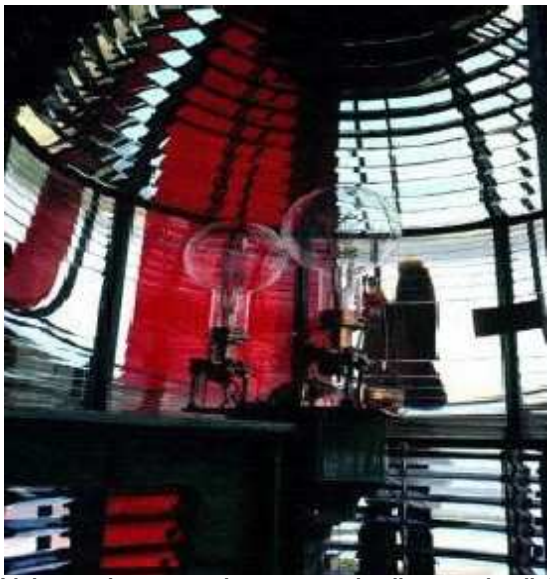
"*Navigare necesse est!*" repeated many Roman scholars, as their ships, the big ones in particular, were incredibly prone to disaster. Since the Carthaginian domination of the Mediterranean, start the most tragic period of the history of seafaring, in fact, one ship in two was not to return to shore, every year. In deed, the sorrow of mariners' families was hard to compensate with the "*necesse*" of sea trade and sea based known world domination.

Unlike the Indian, Arab and Ethiopian sewn planks ships that helped in classic antiquity in Indian ocean trade, shorter much more reliable central rudder steer rather elastic seaworthy contraptions, the huge quinquiremes had no time to correct their direction facing a danger. This is a field we have been studying in Ethiopia. Sixty or more metres long Carthaginian or even larger Roman ships were only steered via quarter rudders on both sides.
So Polybium, a Roman Greek warfare strategist and writer, took time do deride the rival Carthaginian sea power for their lighthouses' complicated variations: he quotes them as having lighthouses to direct ships, to avoid danger and false lighthouses to attract the enemy concluding, rightfully, they should put less effort in their many lighthouses and more on their ships. Other Roman authors recall the Carthaginians having a small community every thirty miles on the shores along their sea trade routes, I infer to assist and direct ships.
I have hypothesized the Verezzi tower was a lighthouse, possibly manned by the inhabitants of the near village, totally estranged to local architecture, Ligurians indicate locally as an "Arab" hamlet.

The Verezzi Crosa hamlet. A dating of limes or carbon fibres in the walls could help understand its origin

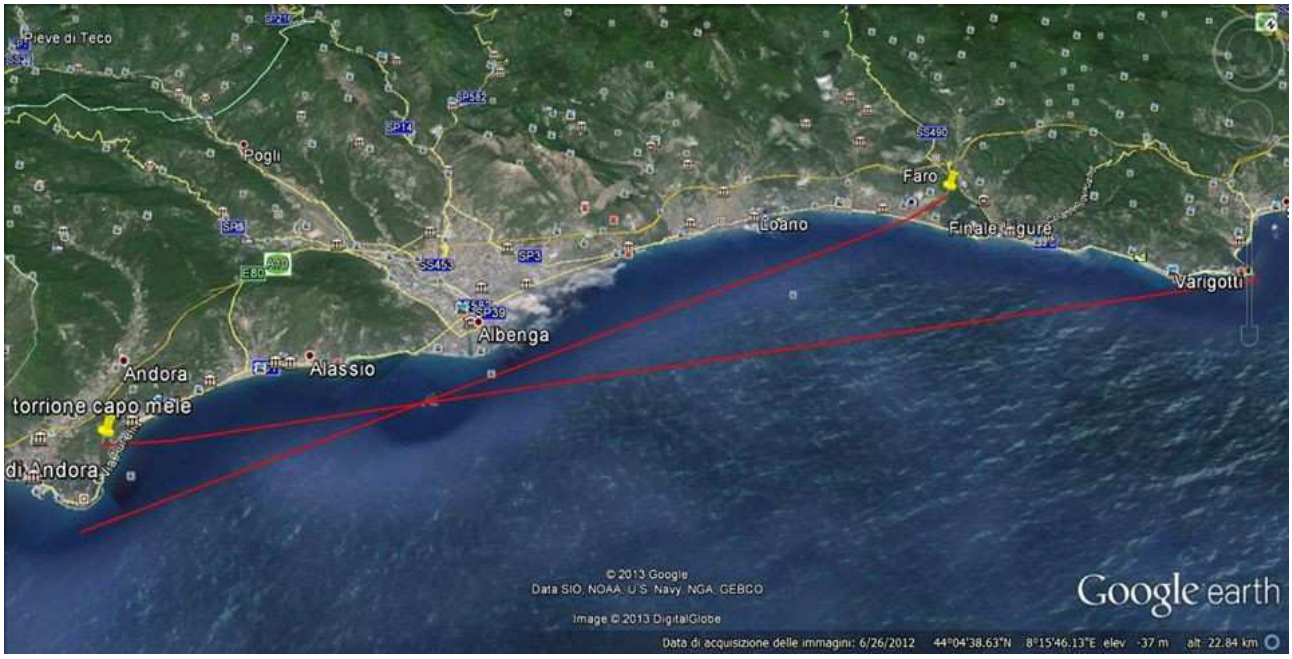
Counter-checking what may be found on the other side of the island, to see if anything could possibly be exactly there, where a disappearing light indicated danger, I perfectly hit a round tower.





A modern sectored lighthouse indicates danger with a Red Light, much as an ancient one used a disappearing light. Courtesy Dr. Ken Trethewey, one of the world's most noted Pharologists, from his first site, http://pharology.eu/

It was there that I first saw the so called “windmill” at Colla Micheri. The one under whose shadows, literally, lies the tomb of navigator, explorer, scholar and dreamer Thor Heyerdhal. Again, displacing this second tower less than a hundred metres, would have meant a light up on it -were it to be a lighthouse- would no longer save ancient mariner's lives from the Gallinara cliffs. Not on the way to Genua or Rome ports, say, but on the way to Frejus -Marseille perhaps- today. In other words, whosoever designed the two perfectly equivalent towers -same width to ten centimetres difference, similar height- placed them on a criss cross, across a wide and long bay, to avoid a very dangerous isolated island: if the light disappears from sight, the quarter rudders must steer, in time, to avoid disaster.



Gallinara stands perfectly placed at the crossing of the two opposite navigational paths joining the two lighthouses to it

Colla Micheri and Verezzi towers show exactly the same diametre from sat views, 6.20 metres. a) Pascal McLee on Panoramio.com, b) by unknown, historic photo prior to the 1984 illegal modifications, festivalverezzi.it

3.2.2 Two more apparently totally misplaced very ancient lighthouses make sense if placed to signal major dangers

Actually, apart from two “lighthouse tombs”, the most ancient lighthouses we know of so far: the Akeratos tomb in Greece and Philon's one in Leptis Magna, Egypt (some 2.200 years old) two more extremely ancient lighthouses, the one of Nero in Pattara, Turkey and the one at La Coruna, both dating from the first decades of our present era, appear conveniently placed to support my theory. They stand far from promontories, exactly where their lights would have disappeared if ships were approaching extremely dangerous isolated islands, the Catals in Turkey and the Islas El Portino in Spain. Not at all a place to expect finding lighthouses, normally.

Nero's lighthouse, Patara, inconveniently placed on a beach far from the promotories, destroyed by a Tsunami that killed one of its keepers, found under an architrave, could only be here to signal the Catal islands (!) Was this the site of an earlier lighthouse, also Carthaginian or Phoenician?

photo terrantiquae.com

Only an height of the lighthouse lower than 15m allows the light to set behind the promontory approaching the Catals

The lighthouse at La Coruna, Spain is just a few years posterior to the one in Turkey, and is said -not an historical confirmed fact- to be placed on the exact site of a prior Carthaginian lighthouse. For sure, its XVII century Castillan Spain remake, the present “tower of Hercules” was erected some ten metres higher: some ten metres too high. So approaching mariners had the Crown authorities add that evident long lateral pillar to it. The Spain king's engineers did not invent the sectored lighthouse on purpose, but to correct an evident and dangerous design imperfection: the newly refurbished, beautiful lighthouse was guiding ships to hit the low and dangerous El Portino islands. Unless the engineers shadowed the light, again. Like the original Carthaginian design and emplacement imposed. As the Spanish light was too highly placed, in disrespect of the lost rule.

Torre de Hercules, originally Carthaginian lighthouse rebuilt some ten metres too tall. It soon needed a pillar to block the light, to avoid causing wrecks. Photo posted on pinterest.com by Conchi Fernandez

Not on the main promontory, the original lighthouse indicated the port access, avoiding the islands

Excavations in Crosa di Verezzi and studies on the two twin towers across the bay are much in need to understand a vital part of what was a long forgotten lesson of North African, Carthaginian navigation: the need to erect and man lighthouses to indicate dangers to perilous, but inevitable night time sea faring. This is a further missing link of the vast sea routes that from Africa covered the whole of the known world around the on start of our Common Era.

A view of the Gallinara and Cape Noli from Colla Micheri.

I conclude these four lighthouses -the most ancient found so far, as the quest for the "Pillar of Achilles" at cape Sygeum has yielded no ruins so far- were of African origin. Likely Carthaginian, and related to the ancient trade of African prime matters and other goods that the Ancient Egyptians fostered since their, more numerous than so far known, voyages to the land of Punt, Eritrea.
As even the more steerable trade ships needed guidance along the Mediterranean Coast, well before the Romans made it their sea, "Mare nostrum".
Pharology, in itself a difficult, at times controversial matter, would contribute largely to understanding the trade channels of classic antiquity, from the North Sea to the tip of Africa.

4 Weilue, China's book of the "Peoples of the West"

Author Yu Han, completed around 250 CE a list of Countries, ports, civilisations, commodities, edifices, towns and activities of interest in the "Western seas", including the Indian Ocean, the red sea and the Persian gulf, the Mediterranean and the African Atlantic ocean akin to contemporary and earlier Greek and North African *peripluses*, or perhaps to one of today's travelogues[38].

Ch. 12 on Zesan, Azania -the East Africa coast- ends so:

"Da Qing (Rome) can be reached from Zesan travelling SW via the Western Sea (Atlantic Ocean), but the number of Li is unknown".

The Weilue periplus or geographical book shows very definitely that Chinese scholars of the period were aware that it was possible to reach Rome by another route from Zesan, Azania, to the south west, sailing around Africa.
There is a perfectly parallel passage in the Periplus Mare Erithreum, a first century CE travelogue. After discussing ports south along the East African coast as far as Rhapta, somewhere in present day Tanzania, it goes:

“These are just about the very last ports of trade on the coast of Azania to the right of Berenicê [i.e. to the south]. For, beyond this area lies unexplored ocean that bends to the west and, extending on the south along the parts of Ethiopia and Libya and Africa that turn away, joins the western sea [i.e. the Atlantic Ocean].”[39] Note, Western sea was the Atlantic Ocean to the Greek, Western seas were all those mentioned at the beginning of this chapter for the Chinese.

This an evident reference to the knowledge that it was possible to circumnavigate Africa.

Learnt Romans of the 1st and 2nd centuries CE were aware that it was possible to sail around Africa to reach Asia. They would have known of Herodotus’ account of the successful circumnavigation of Africa by Necho II fleet, and of the attempts of Eudoxus of Cyzicus to reach India by sailing around Africa in the late second century BCE, which were recorded by Strabo. Possibly of Eudoxus’ two trips and expeditions. Interestingly, Eudoxus was stimulated to attempt the feat, and possibly lose his life in the second attempt, after finding and abandoned ship somewhere along the coast of West Africa, which locals and his knowledge attributed to a ship from Cadiz, near the Gibraltar Strait[40].

Seneca made a confident prediction in his Naturales quaestiones (CE 63-5), that Spain would soon be linked to the Indies by sea. It seems likely that his confidence was based on current accounts of the possibility of the circumnavigation of Africa[41].

“To the question whether the ‘Dark Continent’ was circumnavigated in antiquity it may be answered that we have authenticated records of four attempts to do so. The first, apparently successful, was made c. 600 B.C. by Phoenician sailors in the employ of the Egyptian Pharaoh Necho II.
The second, known to have been a failure, was made in the early part of the fifth century B.C. by Sataspes, a Persian grandee of the court of Xerxes. Both the third, which was unsuccessful, and the fourth, whose outcome is in doubt, were made in the late Ptolemaic period by the Greek mariner Eudoxus of Cyzicus, whose voyages on the Indian Ocean have already been noted.”[42]

Fra Mauro map designs and describes the voyage of a “Concho da India”, an Indian or, more likely, Chinese Junk across the Cape of Good Hope. A ship, not a fleet, as producer of fantasy-history Gavin Menzies in his “1421, the Year China discovered America” insists with vehemence, against all comments from real historians aware of the matter.

Fra Mauro's tip of Africa has the “Concho da India” and its rather fabulous story. Placed at 1420, Age of Zheng He. South is Up.

Property of Biblioteca Naionale Marciana Venice, courtesy of Piero Falchetta, curator

While news of Chinese approaches to the Cape may have reached Mauro in Venice from different sources, including the monks that designed the “Abassia” part of his map, this is for sure no proof

of a Chinese discovery of the Americas just before Columbus, rather, a proof of navigation and trade well south of Sofala, the Great Zimbabwe outlet bay, and present day Mozambique.

I deem it good to know about Menzies' mischievously led conjectures, very easy to debunk. His editors and producers helped him make a total best seller out of this totally baseless theory, on how a spring off of Zheng He's fifth voyage would have reached present day US, presumably visiting, too, most of the present day major US ports (sic!). Pity the supposed discoverer sailor's tomb was duly found in the far east, a medieval Chinese stargazing tower on the East Coast happens to be an 18th century well recorded mill, as his purported proof are all spoof, including the Fra Mauro Junk.

We in Africa should never let people of the Luigi Bonomi -Menzies' editorial director- sort lead us into possibly lucrative, but very counter-productive speculative use of our finds[43].

It is appealing to show formal, perused history is wrong or manipulated, but unless this is done on solid, logical, demonstrated grounds, we will only stir, and spoil a vast and special pot of broth.

There is already enough dis-attention, or, still, active opposition to truly discover our past, for us to be unscientific in our reasoning, to thus give in to easy detraction.

8 Pero da Covilha and Afonso da Paiva left Portugal in 1497 at the same time of Bartolomeu Diaz.

Vasco da Gama was enrolled to connect the two voyages' result to finally bring revenue to the Lisbon Crown. He did so rapidly, as in the first days of April 1498 just before reaching Mombasa, he resorted to piracy attacking unarmed Arab cargo ships to steal their goods. He was rapidly chased off the Mombasa port, in effect. Treated neither as an ambassador nor a trader, but as a pirate after just weeks in East Africa. Portugal's caravels and heavier ships came immediately following, heavily armed. As a good example of their conduct, I bring here the “discovery” of Malaka, the rich Chinese manned port in the straits. It was noted in 1509, and the “discoverer” decided it was too vital not to control: “he who holds Malaka holds the neck of Venice”. Not assured his fleet could control it for long, he destroyed it thoroughly less than one year after the “discovery”.

12 Richard Pankhurst, personal communication. The real focus of this whole controversy remains, to me, that for two centuries, associated with heavy colonization in Africa, historians took as a paradigm that Kemet Egyptians were some special distinguished people, like a non African race. This was methodically pursued to be able to justify the continuing subjugation with pseudoscientific inferiority theories. While they were as African as they could be, with variants of colour and tracts. The Fitzwilliam Museum in Cambridge, Part of the British Museum Collections, on its online page on the Kemet, Ancient Egyptian collections, is absolutely clear on the matter, pls. Cfr.: http://www.fitzmuseum.cam.ac.uk/dept/ant/egypt/kemet/virtualkemet/faq/

Ancient Egyptians were black, likely not ebony black. Today's population is a different mixture, according to a number of scholars. Others think this is irrelevant, some resist in considering Ancient Kemet Egyptians as akin to the more Arab race today prevalent in modern Egypt. This is the only representation of Egyptian mariners I could draw online. Not Paraonic deities, or commonly Black depicted Queens, commoners, a representation more likely to be fully true to reality, represents Black African of Habeshat, or Ethiopian complexion and hair attire

19a "The first tribes that inhabited Egypt that is, the Nile Valley between the Syene cataracts and the sea, came from Abyssinia to Sennar. The ancient Egyptians belonged to a race quite similar to the Kennous or Barabras, present inhabitants of Nubia. In the Copts of Egypt we do not find any of the characteristic features of the ancient Egyptian population. The Copts are the result of cross breeding with all the nations that have successively dominated Egypt . It is wrong to seek in them the principal features of the old race." Champollion-Figeac, Francis, in a 1867 published letter

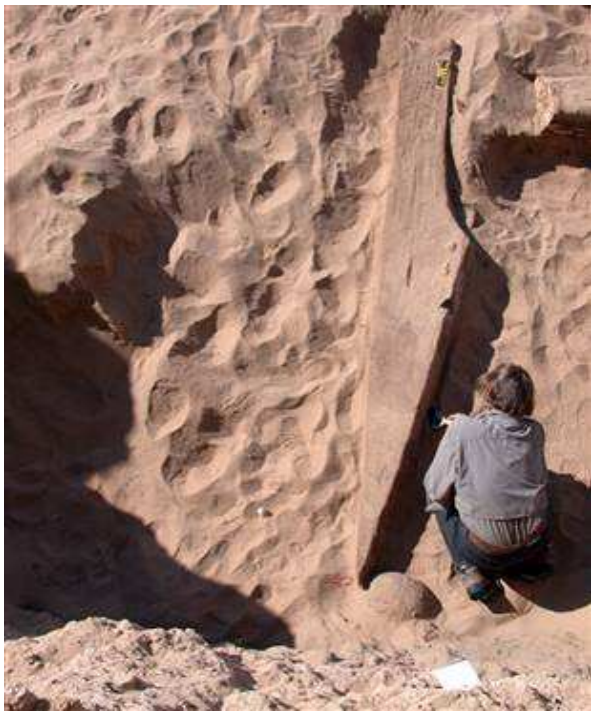
The finds include a few known Chinese style tombs, one Emperor Yong-Le coin, coeval to the Zheng-He massive naval expeditions, and some porcelain shards

36 Fattovich, Rodolfo, personal communication. Published papers on the Marsa Gawasis site are by Fattovich, Katherine Bard, and Chiara Zazzaro amongst others. Were the ships found of Phoenician influence, mortise and tenon, or African sewn ships? If the large wood plank in these photoes I recovered online is one of the side planks, I would deduce the first found sea going ships, Egyptians, were in Gawasis, S'W'W', were different. Much thicker planks than the Uluburun ship, the Phoenician prototype, with coupled planks of the mortise and tenon type, yet with no wooden pegs or any nail: sewn ships of some yet unknown type. The wood is Cedar of Lebanon.



Katie Bard, wood a) Just Genesis on blogspot.com b) diggingsonline.com Gawasis page. Both photoes by C. Ward

The plank thickness and shape would exclude it is an oar, for rowing or steering. This is enough, coupled with the near coeval Hatshepsut Punt expedition reliefs at her grand temple at Bahir Dahri for a good guess on how the ships were made. With wood taken via land and sea from Lebanon.

Marine Archaeologist Cheryl Ward made a replica of Douglas fir, a hardwood like Lebanon cedar, without a frame and use of nails. She must have interpreted the ship found in Gawasis as of the sewn plank type. A French TV crew sponsored the replica to film it sailing to Punt: to Eritrea. Insecurity made the feat impossible, not before she managed to prove the ship, "Min of the Desert" fared at around six knots. Fast enough to make the return journeys in two months.
Cfr. https://www.fsu.edu/news/2009/03/09/egyptian.sailors/
This Kemet ship find is absolutely crucial, more similar discoveries will come if we put attention the the Red Sea and East African harbours

43 Australian master mariner Captain Rivers has collected a vast heap of absurd and patent lies in Menzies' narrative, published on this site: http://www.1421exposed.com/
An Australian TV documentary by Quentin McDermott "Junk History" organized an interview with Menzies focussed on the "American Discovery" in which each and every of his arguments is exposed. He has no relevant or concrete answer to produce. Better even, his editing manager Luigi Bonomi reveals the plain truth: the lie was intended -would You guess- not to annoy real scholars or confuse readers, but for the vast money gain in sight. Welcome be the controversy. If more books, interviews, conferences are sold.

"Professional historians label it naïve scholarship or worse, straight-out fabrication. Menzies writes, amongst other things, that New Zealand Maori are not Polynesians but a cross breed of Chinese concubines and Melanesians. The evidence for this, and many similar claims, is tissue thin.
So was "1421" an eccentric and fluky publishing success? Well no. Junk History tells how Menzies, his agent, his PR company and publisher set out to milk a public thirsty for revisionist history. Menzies hired professional spin-doctors to create hype about a half formed idea. Transworld, which also publishes Dan Brown's "Da Vinci Code", paid Menzies, an untested first time writer, a half million pound advance. The book was finished by a team of editors and a ghost writer. Revisionism is big business". From the Four Corners investigative debunking team's documentary presentation.

The documentary includes an interview with Geoff Wade, Singapore University, a real, not "junk" expert of Chinese navigation, and of Zheng He's seven expeditions in particular

Alfonso X of Castile: Alfonso the Tolerant?

Michael Ruiter

Mediaeval Iberia was rife with inter-religious conflict between Christians, Jews, and Muslims that incited forced conversions and culminated in mass expulsions. Yet, in the midst of such a harrowing time in the peninsula's history, there were occasional elements of harmony between these three groups, made all the more impressive in their rarity. King Alfonso X, the Wise, was a man whose rule exhibited a relative tranquility in inter-religious relations some have even suggested is deserving of altering his sobriquet to Alfonso the Tolerant. Through an examination of his law code, the ***Siete Partidas***, and a compilation of several hundred canticles, the ***Cantigas de Santa Maria***, this paper pinpoints elements of Alfonso's rule to critically assess the claims of his tolerance.

> The law codes of Alfonso the Learned of Castile, and especially his monumental Siete partidas or Seven Divisions, are arguably that monarch's greatest gift to posterity, surpassing his scientific contributions, his work in art and music, and his literary and linguistic heritage.
>
> —Robert I. Burns[1]

Without speaking of posterity, Alfonso X's *Siete Partidas* was certainly of great significance to Medieval Spain. So were his other works in the sciences, art, music, and literature. There has been debate among scholars that, as evidenced by his contributions to posterity, Alfonso the Wise may appropriately be called Alfonso the Tolerant. His work certainly provides evidence of inter-religious relations between Christians, Jews, and Muslims in medieval Iberia, but whether such relations are evidence of tolerance remains the subject of scrutiny. Examining the law code, *Siete Partidas* (Seven Divisions) as representative of his legislative work, as well as the *Cantigas de Santa Maria* as representative of his work in art, music, and literature, in light of any ulterior political intentions within those works, one can discern marked evidence of Alfonso X fostering tolerance under his rule.

Tolerance

Since the Moorish introduction of Islam to Iberia in 711, there has been a tension between Christianity, Judaism, and Islam. Over the years this tension was exacerbated or relieved on the basis of changing economic, social, and political conditions. Alfonso X's rule (1252-1284) may be seen as one such change in political conditions. A rule under which, some have claimed, Alfonso exhibited a tolerance towards the three main religions of Iberia.

In order to assess any claim of Alfonso X's tolance, one must first define that term. Dwayne Carpenter, arguably the greatest supporter of the argument for Alfonso's edited epithet, addresses

1. Robert I. Burns, "Jews and Moors in the *Siete Partidas* of Alfonso X the Learned: a Background Perspective" in *Medieval Spain: Culture, Conflict and Coexistence,* edited by Roger Collins and Anthony Goodman (Gordonsville: Palgrave Macmillan, 2002), 46.

this argument on the premise of 'tolerance' holding the meaning of the Latin *tolerare*, specifically referring to the endurance or allowance of something.[2] He stresses, "tolerance does not require either a preference for or understanding of that which is tolerated."[3] In appointing Alfonso with a sobriquet of tolerance, Robert Burns cautions the word is "a modern construct" and a "legacy of the Enlightenment era." However, he acknowledges Carpenter's "reinventing tolerance as justice [. . .] may at least save the term."[4] Putting aside Burns' warning regarding the origin of the term, an important warning without doubt, he is rather presumptuous in referring to Carpenter's use of the term as a redefinition. In clarifying the meaning of 'tolerance,' Carpenter does not redefine it, he simply emphasises the original semantics of the word free from the ameliorative connotations it has received contemporarily. While Carpenter does indeed refer to justice as "the essence of tolerance," he does so in the context of tolerance not requiring a preference or even understanding, and explicitly refers to 'justice' in its contrast relative to 'love'—or further amelioration.[5]

An additional caveat should be added regarding the issue of intention. If Alfonso's rule was one of tolerance by happenstance, in spite of specific legislation aiming for the opposite, then he should not be said to be 'tolerant'. Connie L. Scarborough argues, "for Alfonso, the political is always present, subtly and at times not so subtly, revealing itself even in the work most critics consider to be the most personal expression of his religious sentiments."[6] If the political takes precedence at the expense of tolerance, then Alfonso cannot be said to be tolerant. More specifically, if the tolerance he exhibited was the unintentional side effect of some larger political design it cannot be called tolerance. Conversely, if tolerance is a primary feature, and aim, of the political nature ever-present in Alfonso's works, then perhaps he is deserving of the title. Thus, with the warnings regarding the semantics of the term in mind, tolerance, for the purpose of this paper, will be defined as Alfonso X's intentional acceptance or allowance of the endurance of Muslim and Jewish practices—a tolerance for which, Burns agrees with Carpenter, can be found in "both religious praxis and economic elements."[7]

The Siete Partidas

Although completed between 1256 and 1265, it has long been argued that Alfonso's law code, the *Siete Partidas,* was not promulgated until the 14th century, and even then only as a supplementary law.[8] More recently, some historians, Burns and Carpenter among them, have argued based on the "framing language in the *Partidas,*" it was actually an amplification of the statutes put into effect by the *Especulo*—promulgated in 1254—which took effect immediately upon completion.[9] Joseph O'Callaghan takes a similar position, positing that the *Siete Partidas* was indeed in effect during Alfonso's lifetime within the royal court, with the towns of Castile and *Extremadura* being governed under the separate laws of the *Fuero Real.*[10] There is a statement in the *Chronicle of Alfonso X* regarding

2. Dwayne E. Carpenter, *Alfonso X and the Jews: An Edition of and Commentary on* Siete Partidas 7.24 "De los judios" (Berkeley: University of California Press, 1986), 105.
3. Carpenter, 105.
4. Burns, 48.
5. Carpenter, 105.
6. Connie L. Scarborough, *A Holy Alliance: Alfonso X's use of Marian Poetry* (Newark: Juan de la Cuesta—Hispanic Monographs, 2009), 14. While Scarborough argues this point in exclusive reference to the *Cantigas de Santa Maria*, one can assume that if such political issues were present in works of literature and music, they would also be present, perhaps even more so, in legislative works such as the *Siete Partidas*.
7. Burns, 48.
8. Ibid., 47.
9. Ibid., 47.
10. Shelby Thacker and José Escobar, trans., *Chronicle of Alfonso X* (Lexington: University Press of Kentucky, 2002), 2. The argument cited is in the introduction written by Joseph O'Callaghan.

the promulgation of laws in 1260 that some interpret to include the *Siete Partidas*.[11] Some lines of the *Siete Partidas* are qualified by the statement, "in any part of our dominions," implying a universal nature to that particular law.[12] Unfortunately, such qualifications support either argument since these laws are repeated in the *Fuero Real*, which warrants mentioning they apply everywhere in Alfonso's dominion, or else they are formulaic statements (implied when not found explicitly) meaning the entire *Siete Partidas* was applicable everywhere in Alfonso's domain. Whether it was in use only within the royal court, or throughout all settlements in Alfonso X's domain, its use within Alfonso's lifetime is likely. Given that the rival argument is simply a *terminus ante quem*, following Carpenter's logic, the *Siete Partidas* is be presumed to have been put to use upon its completion, or shortly thereafter.[13] Having been penned by Alfonso—or at the very least supervised by him—and likely put to use during his lifetime, the laws Alfonso puts down in the *Siete Partidas* are done so intentionally and with political motivation.[14]

One aspect of the *Siete Partidas* worth noting is both in its construction as a law code, as well as the ideology behind those laws, it was influenced by past events and legislation.[15] Modelled on Roman law codes and influenced by inter-religious relations, particularly those between the Christians and Jews, by everything from the Visigothic rule of Spain to the Talmudic controversy of Judaism, Alfonso, although adding nuanced distinctions of his own, was for the most part following a pre-existing model of ideology and philosophy in his *Siete Partidas*.[16]

Section 7.24 of the *Siete Partidas* focuses specifically on the Jews under Alfonso's rule and, as such, bears the most evidence of a Visigothic legacy.[17] For this reason, it is often considered to be antagonistic toward the Jews.[18] Indeed, the penalty for converting a Christian to Judaism was loss of property and death; if a Jew was to venture out of his home or district on Good Friday, he is likely to be subjected to crimes inflicted by Christians and if this is the case, he was not entitled to any reparations; moreover, if a Jew was found guilty to having been present, "no matter how many there may be," at the anti-Christian crimes reportedly taking place on Good Friday, he was to be "put to death in a disgraceful manner."[19] Further indications of possible intolerance can be found in the laws forbidding Jews and Moors from inter-religious relationships with Christians, the prohibitions against Jews housing Christians, and the proscriptions against Christians taking medicine given by

11. Ibid., 46 (Ch. 8 of *Cronica del rey don Alfonso X*). The position that the *Siete Partidas* is included in this promulgation can be found under endnote 2 of that chapter.
12. Olivia Remie Constable, ed., "The Legal Status of Jews and Muslims in Castile: *Siete Partidas* (early fourteenth century)" in *Medieval Iberia: Readings From Christian, Muslim, and Jewish Sources,* translated by S. P. Scott (Philadelphia: University of Pennsylvania Press, 2012), 400. Two such examples may be found on this page alone.
13. Burns, 47. The argument of the 14th century being a *terminus ante quem* is based on the fact that it was only named the *Siete Partidas* in the 14th century. The common assumption is that it only received this name when it was promulgated and was therefore not promulgated until the 14th century. Cf. Richard P. Kinkade and Joseph T. Snow, "Alfonso X (23 November 1221-4 April 1284)" in *Castilian Writers, 1200-1400,* edited by George D. Greenia and Frank A. Dominguez (Detroit: Gale, 2008), 5-7, http://galenet.galegroup.com.login.ezproxy.library.ualberta.ca/servlet/DLBC_Online/edmo69826/BK1560745002.
14. Scarborough, 14. See footnote 5.
15. Joseph O'Callaghan, *The Learned King: The Reign of Alfonso X of Castile* (Philadelphia: University of Pennsylvania, 1993), 17-19.
16. Burns, 48, 50-51 for Talmudic controversy and influence of preexisting philosophy and ideology. For further evidence of the *Siete Partidas* being influenced by preexisting ideologies, as well as, specifically, the legacy of the Visigoths on Christian-Jewish relations, see Carpenter, 3-5.
17. Carpenter, 4-5.
18. Constable, "The Legal Status of Jews and Muslims in Castile," 399. It should be noted that Constable makes this argument in a way that contrasts Christian-Jewish relations with Christian-Mudejar ones.
19. Ibid., 399-400.

Jews.[20] One law in particular shows a particular anti-Jewish bias, claiming "no Christian shall take any medicine [. . .] made by a Jew; but he can take it by the advice of some wise person, only where it is made by a Christian."[21] Presumably, this "wise person" could apply to anyone, Christian or Jew, yet the advice of that person may only be followed if the medication itself is made by a Christian, implying mistrust, or at the very least apprehension, toward Jews. Yet, ethnocentric as it may be, mistrust is not, by the above-defined parameters, intolerance. In fact, none of the laws here mentioned fit such a definition.

One set of laws which, by the definition put forth above, illustrates intolerance regarding mosques and synagogues. Mosques and synagogues are integral buildings for worship and therefore integral to the maintenance of Islam and Judaism. Although history has proven the faithful of both religions endure without these buildings, one could argue that such perseverance was in the direct face of intolerance since the lack of such religious buildings is detrimental to the continuance of these faiths. The *Siete Partidas* forbids the construction of new mosques and synagogues.[22] Furthermore, the mosques already in existence were to become the property of the king and—although he could still permit their existence—they were forbidden from existing in Christian towns.[23] Although ostensibly this law was designed to hinder continuance of Islam and Judaism, it bears stipulations proves Alfonso was more concerned with diminishing the public display of these religions, than he was with eradicating them.[24]

Another arena for intolerance is the converts. In this case, it seems there are no redeeming provisions in the *Siete Partidas*: any Christian that converts to Islam or Judaism was sentenced to death and loss of property.[25] Through their conversions, these people were no longer part of Christianity, but a member of the faith they have chosen to convert to and, in condemning them to death, the *Siete Partidas* hindered their ability to continue practicing their chosen faith. The laws regarding conversions were, therefore, intolerant. Alfonso's intention behind these laws may be questioned, for it seems he still perceived them to be Christians. Converts to Judaism were put on the level of heretics—although explicitly separated from heretics—and converts to Islam were condemned on the basis of treason.[26] Based on these perceptions as they appear in the *Siete Partidas*, one might argue that Alfonso's intention was not for the detriment of enduring Islam and Judaism, but for the prolonged continuance of Christianity since conversions were crimes committed by Christians. Additionally, the outlined definition of tolerance was free from the need for understanding or appreciation, and it could be this very misapprehension of the nature of converts—or unwillingness to apprehend—that led to the creation of these laws.

Carpenter's opinion is, "in spite of increasingly antipathetic attitudes and policies toward Spanish Jewry, Alfonso's general posture in this regard is one of leniency."[27] While it is true that Christians were actively attempting to convert Jews and Muslims to Christianity, the *Siete Partidas* stresses that such conversion efforts should be made "by use of kind words, and not by compulsion."[28] In

20. Ibid., 402-405. 'Moors,' as used in the *Siete Partidas,* and likewise used in this paper, refers not exclusively to the ethnicity, but to any Mudejar.
21. Ibid., 402.
22. Constable, "The Legal Status of Jews and Muslims in Castile," 403.
23. Ibid., 403. Cantiga 169, discussed further below, provides evidence that the king did indeed permit the continuance of mosques in non-Christian towns.
24. Namely, the fact that they are permitted to exist as long as not in Christian towns—see footnote 21.
25. Ibid., 401-404.
26. Constable, "The Legal Status of Muslims and Jews in Castile," 401-404.
27. Carpenter, 5.
28. Constable, "The Legal Status of Muslims and Jews in Castile," 403.

specific reference to Jews, the *Siete Partidas* even goes so far as to say that they shall live their lives "without disorder, practicing their own religious rites," which is evidence of an effort for the allowance of Judaism to continue under Alfonso's reign.[29] Taking into account both the laws regarding synagogues and mosques, as well as those involving Christian converts to other religions—the latter with the question of intentionality taken into account—the laws within Alfonso's *Siete Partidas* can perhaps best be described as exhibiting a "restrained tolerance."[30]

Cantigas de Santa Maria

Alfonso X commissioned the compilation of the *Cantigas de Santa Maria (CSM)*, the two volumes of which were completed in his lifetime and contained over 400 songs.[31] These Marian Canticles were written in Galician-Portuguese and contain multiple genres including songs of friendship and songs of love.[32] Several of the canticles are written in the voice of Alfonso and, like the laws of the *Siete Partidas*, if not written by him, were certainly written with his influence.[33] O'Callaghan even goes as far as to argue that the *CSM* may be seen as a poetic autobiography.[34] While past scholars have argued that the *CSM* were influenced by Arabic musicians and thus pointed to inter-religious interactions, more recent research, most notably that of Dwight Reynolds, has pointed to the fact that although inter-religious relations are easy to prove, this is not the case with 'influence,' which can most often only be found "in the eye of the beholder."[35] Taking the ambiguity of musical 'influence,' along with the fact that several of the canticles are in the voice of Alfonso, and keeping in mind Scarborough's aforementioned assertion that the political is present in *all* of Alfonso's works, one can conclude that the portrayals within the *CSM* are both intentional and bearing a political motive.[36]

One such *cantiga* in the voice of Alfonso X with an outward appearance of evincing the king's tolerant nature is *Cantiga 169*. Having predominantly assessed Christian-Jewish relations in examining the *Siete Partidas,* this canticle can be used to shift the focus to Christian-Muslim relations. In this canticle, the Muslims of La Arrijaca, a settlement of Murcia specifically designated as being a Mudejar settlement, make several requests to have a church of Mary taken down.[37] This church was formerly a mosque, but since it is on Mudejar land the Mudejars wish it dismantled. This request is granted by various rulers to whom the Mudejars appeal (both don Jaume, king of Portugal, and Alfonso X who is hesitant due to the church's fresh paint job), and after several unsuccessful attempts to dismantle the church due to a supposed divine intervention, they finally appeal to the

Moorish king who refuses due to a fear of retribution at the hands of Mary.[38] On the surface, this politically-charged canticle goes beyond tolerance and presents Alfonso's attitude toward the Mudejars as magnanimous, and the relationship between them as harmonious, he concedes with only a brief second thought to the dismantling of a Church for the sake of his Mudejar subjects.[39]

Despite this outward appearance of harmony an examination of this *cantiga* in historical context suggests that not all is as it seems. La Arrijaca came to Alfonso's possession in his youth.[40] After a series of battles, and division among his military leaders, Muhammad Ibn Hud, fearing the Kingdom of Granada would annex his kingdom, decided to swear fealty to Alfonso X's father, Fernando III.[41] Alfonso, on behalf of his father, was sent to accept Ibn Hud's vassalage and thus inherited the region of Murcia.[42] While Fernando III restricted La Arrijaca as Mudejar territory, granting them autonomy under his authority, Alfonso X, in the interest of resettlement, moved Mudejars from Murcia to remote under-populated settlements and replaced them with Christians.[43] Among those to whom an appeal is made for the dismantling of the church, Fernando III's name is notably absent.[44] One could infer from this exclusion the Mudejars felt less satisfied under Alfonso's rule than under his father's rule.

Such an inference is supported by the Mudejar rebellions and uprisings in Murcia during Alfonso's reign—particularly when some side with the Granadan forces attacking Alfonso's border—as well as their (perceived) special relationship with Alfonso, predicated on the fact that they were a protectorate.[45] The importance of the latter is brought into relief by the fact that Alfonso's first time visiting Murcia in five years was spent consolidating the resettlements and may have been seen as a betrayal of the special relationship he had in the region with his Mudejar subjects.[46] Likewise, the argument can be made, that Alfonso likely felt betrayed by their rebellion in his absence. Evidence for this last point may be found in the reason for Alfonso's hesitance to agree to allow the church to be dismantled. The reason of the church being freshly painted can be seen as evidence it was damaged during the Mudejar rebellion.[47] The Moorish king in the canticle, who refuses to have the church removed, is suggested by O'Callaghan to be Abd Allah ibn Hud, a descendant of Muhammad Ibn Hud and vassal of Alfonso.[48] Given that this king "still retained some vestige of authority over the Muslim community," coupled with the knowledge relations between Alfonso and the Mudejars of Murcia were strained, may be evidence of political messages in Alfonso's hesitation to agree to the church's removal and in the Moorish king's refusal to do so.[49]

The final part of this *cantiga,* which relates an attempt by Abu Yusuf of Salé to take Murcia by means of stealth, is chronologically skewed from the other events of the *cantiga.*[50] Scarborough posits such

38. Constable, "Five Stories from the *Cantigas de Santa Maria,*" 366-367. This Cantiga also mentions a plot of trickery by an invading force to destroy the church but Mary intervenes and the church remains unharmed.

50. Scarborough, 50.

an inaccurate portrayal of events in a song that was presumably printed with Alfonso's express permission is due "to the fact that Alfonso was less concerned with clarity [. . .] of historical data than imparting a political message."[51] With the prevalence of a political message in the text, Alfonso being a magnanimous character, is reinforced by the fact he acts as such in spite of inter-religious tensions with the Mudejars. Regardless of the strained nature of such relationships *Cantiga 169* supports the above-described definition of tolerance due to Alfonso's willingness to dismantle a church, the presence of which the Mudejars see as detrimental to the continuance of their religious practices.

Importance of the Political

Scarborough is not alone in stressing the importance of the political in all of Alfonso's endeavours. When discussing his reign, many scholars note Alfonso X's political preoccupations, particularly his political ambitions to be named Holy Roman Emperor.[52] Intentionality becomes paramount in discerning Alfonso's tolerance, for if the tolerance reflected in the *Siete Partidas* and *CSM* was simply put there to prove to other rulers his wise nature in an effort to be named Holy Roman Emperor, then such tolerance was likely not as well-reflected in practice under Alfonso's reign. Tantamount to a preoccupation with furthering his political standing—mainly because the two are inextricably linked—were Alfonso's efforts to complete the Reconquest of Spain: an effort to achieve a unity of Spain, both politically and religiously.[53] If Alfonso was truly aiming toward a religious unity of Spain this aim dashes any possibility of calling Alfonso tolerant, since such an aim would demand an end to the endurance of Islam and Judaism in Spain. Yet Scarborough cautions modern scholars not to fall prey to the "erroneous assumption [. . .] that the Reconquest was essentially religious in nature."[54] With this warning in mind, it is possible Alfonso sought the political unity of Spain under a united religious *rule* only. A rule, like his own in Castile, which left room for the continuance of other religions, such as Judaism and Islam, beneath it.

What of the intentions of his works? Were the *Siete Partidas* and *CSM* intended simply for the sake of posterity because, as Charles Fraker claims, Alfonso was obsessed with his legacy?[55] Were these works solely meant for other rulers to see the greatness of Alfonso and therefore beyond the knowledge of his subjects? Does the use of Mary as an agent of the Reconquest render all *Cantigas* intolerant?[56] The answer to these questions appears to be a resounding no. Although some scholars remain unconvinced of when the *Siete Partidas* was promulgated, even those in favour of the fourteenth century hypothesis acknowledge that Alfonso's intention was for it to be put to use in his lifetime.[57] The *Siete Partidas* even calls for the need for all citizens to be aware of the laws it

51. Ibid., 50.
52. Cayetano J. Socarras, *Alfonso X of Castile: A Study on Imperialistic Frustration* (Barcelona: Talleres Graficos de Sololibros, 1975), 10. O'Callaghan, *A Poetic Biography,* 1 voices an identical argument, although not explicitly attesting to Alfonso's desire for the crown of the Holy Roman Empire. Similarly, Carpenter, 3 draws several connections between the influence of Rome (both Ancient Rome and the Holy Roman Empire) and Alfonso's legislative works.

contains.[58] The *CSM* was also presumably compiled for public consumption. The fact that all four hundred and twenty-seven canticles are performative in nature, a fact reinforced by the texts beginning with the refrain rather than the first verse, as well as by virtue of several of the *cantigas* being accompanied by musical notation, meaning they were publicly known.[59] Therefore, despite Alfonso X's political ambitions behind his works, or perhaps due to their very existence, the *Siete Partidas* and *CSM* were intentionally made known to the public.

Conclusions

The works of scholars examining the representations of Jews and Muslims in the *Cantigas de Santa Maria* "have reached conflicting opinions, ranging from praising Alfonso for his tolerant attitude to condemning him as a tyrannical bigot."[60] Yet, by the above-defined parameters of tolerance, tyranny and bigoted portrayals of Jews and Muslims—unless detrimental to the endurance of their religious practices—do not preclude tolerance. Furthermore, some *cantigas,* such as *Cantiga 169,* are not guilty of any such portrayal. The explicit call in the *Siete Partidas* for the use of "kind words" in conversion efforts undermines the suggestion negative representations of Jews and Muslims would hinder the continuance of their religious practices.[61] Additionally, although the *Siete Partidas* calls for harsh punishments of Jews and Mudejars for stepping outside the bounds proscribed by law, as they do for Christians, whose bounds, albeit, are far less prohibiting, they do so in a way that allows for the continuance of Islam and Judaism, thereby exhibiting tolerance.

Despite this positive outlook there remains one irredeemable factor in determining Alfonso's tolerance, the converts from Christianity to Judaism or Islam. In putting to death those who convert to Islam or Judaism who are then, by definition, among the members of one of those respective groups, Alfonso X intentionally preventd the acceptance or endurance of Muslim and Jewish practices for those individuals. However, there remains the possibility that Alfonso misapprehended such individuals to be Christians stepping outside the bounds of law rather than Jews or Muslims being prevented from practicing. Yet such misinterpretations do not excuse Alfonso of intolerance since, by his own logic in the *Siete Partidas,* ignorance of the law does not excuse one of penalty from it.[62] Likewise, Alfonso's ignorance as to the religious identity of the converts cannot excuse him of this misinterpretation and Alfonso cannot, therefore, be called tolerant. Other than the issue of converts, Alfonso does however, come close to tolerance. Without looking at the other 426 *Cantigas de Santa Maria,* nor the other six *Partidas,* one can see that his intent in unifying Spain politically and religiously is not meant to be at the expense of the continuance of Islam and Judaism. Due to his proximity to the above-outlined definition of tolerance, Alfonso X was perhaps close enough to earn the sobriquet of Alfonso the Restrainedly Tolerant.

THE KĀRIMĪ MERCHANTS

By E. Ashtor

The important rôle which the Kārimī merchants played in Oriental trade at the end of the Middle Ages has been touched upon by some outstanding orientalists. The last to treat the subject exhaustively was W. J. Fischel in his paper "Über die Gruppe der Kārimī-Kaufleute", published in 1937 in the series *Analecta Orientalia* (of the Pontifical Bible Institute) no. 14. The Arabic historical works of the later Middle Ages contain, however, additional material, which partly corroborates and partly modifies Fischel's conclusions. A good many of the notices on the Kārimīs to be quoted in this paper are taken from the hitherto unpublished chronicle *Inbā' al-ghumr bi-abnā al-'umr* of Ibn Ḥajar al-'Asqalānī (d. 1449), MS. Constantinople, Yeni Cami 814 and the Who's Who of the fifteenth century composed by al-Sakhāwī (d. 1497) and called *ad-Ḍau' al-lāmi' fī a'yān al-qarn al-tāsi'* (Cairo, 1353–55).

I

Fischel compiled a list of fourteen Kārimīs. Adhering to his method of listing only those who are called Kārimī *expressis verbis* (although we may be sure that many other merchants whose biographies are contained in the Arabic historical literature belonged to the Kārimīs too) we should add the following:—

(1) Tāj al-Dīn Ibn al-Ruhā'ilī (الرهائلى, not vocalized in the printed text, means surely "the man of al-Ruhā'", a town which belonged to Syria during that period, although its population certainly spoke Turkish. This explains the Turkish suffix "lī"). Tāj al-Dīn, who died in 1331, was, according to Ibn Kathīr (*al-Bidāya wa 'l-nihāya*, 14, p. 156), the greatest Kārimī of Damascus and Cairo. The Damascene chronicler states that he was believed to have left 100,000 dīnārs in cash, besides goods, precious household effects, and real estates.

(2) Shihāb al-Dīn Aḥmad b. Muḥammad b. Aḥmad al-Bālisī. Ibn Ḥajar (op. cit. f. 18b), in the list of those deceased in A.H. 777, gives his genealogy as follows: Aḥmad b. 'Alī b. Muḥammad b. Yasīr al-Bālīnī. Both the genealogy and the spelling of the names are erroneous. As we read in a passage of Maqrīzī's *Khiṭaṭ* (see below), where the spelling is given, the name of the ancestor of

Shihāb al-Dīn was Basīr. In another passage of the *Inbā'*, quoted below, we read that this man was called al-Bālisī, i.e. hailing from the Syrian town of Bālis. It is the obituary notice of Shihāb al-Dīn's son Nūr al-Dīn Abu 'l-Qāsim 'Alī, who died in A.H. 799 (1396–7). His genealogy is given as follows: Nūr al-Dīn 'Alī b. Shihāb al-Dīn Aḥmad b. Shams al-Dīn Muḥammad b. Shihāb al-Dīn Aḥmad b. Nūr al-Dīn 'Alī b. Najm al-Dīn Muḥammad b. Fakhr al-Dīn Ismā'īl b. Basīr al-Bālisī. In this passage, as in the biographical notice on Shihāb al-Dīn himself, we read that his father or grandfather Muḥammad was a great merchant, but here we are told that his *laqab* was Shams al-Dīn and that he died in the year A.H. 773 (1371–2). (In another passage of Ibn Ḥajar's chronicle, f. 17a, we find that Shams al-Dīn died in A.H. 768 = 1366–7.) This remark, which is supported by Maqrīzī (see below), proves that the great merchant was Shihāb al-Dīn's father and not the son of Basīr. The genealogy in his biography is incomplete, as Ibn Ḥajar jumped over some generations and mentioned, after Muḥammad, the ancestor of the family only. Ibn Ḥajar says that Shihāb al-Din was born to rich and esteemed parents, but did not show great efficiency in his enterprises. He died, still young, in 1376.

(3) Rashīd al-Habbī, whose full name was, according to a marginal note on a MS. leaf of Ibn al-Furāt's chronicle (ed. Zurayk, ix, pp. 419–20), Rashīd (al-Dīn) Sa'īd b. Naṣr al-Habbī. Both this chronicler and Maqrīzī in his *Sulūk* (MS. Paris, Slane 1727, s.a. A.H. 797), mention the exact date of his death, namely 13th March, 1395, without supplying us with further details.

(4) Khair al-Dīn Khiḍr b. Burhān al-Dīn Ibrāhīm b. Yaḥyā. Al-Sakhāwī relates (in *al Ḍau' al-lāmi'*, iii, p. 178), that he was a great merchant like his father. He lived with his father in Aden for a long time, later on went to Mecca and from there to Cairo. When the father died in A.H. 811 (1408–9), Khair al-Dīn returned to Mecca in order to settle there, but could not stand the extortions of the local authorities and had to go back to Cairo, where he died in 1417 or 1418. He is called *al-Rūmī al-tājir al-Kārimī* by a writer quoted by al-Sakhāwī (The printed text reads, indeed, " al-Kāzimī," but this is surely a mistake : الكازمى instead of الكارمى).

(5) Shams al-Dīn Muḥammad al-Māḥūrī. Al-Sakhāwī (*al-Tibr al-masbūk*, p. 198) says that he belonged to the courtiers intimate with the Mamluk Sultan al-Malik al-Mu'ayyad Shaikh, who ruled

from 1412 to 1419, and that he discharged the task of administrator of al-Azhar. Further he mentions that he possessed a building in the neighbourhood of this famous mosque. Muḥammad al-Māḥūrī died in Mecca.

(6) Badr al-Dīn Ḥasan b. Suwaid al-Mālikī. This jurisconsult was sometimes notary public and sometimes Kārimī merchant. Ibn Ḥajar (f. 225b), whose statements are supplemented by al-Sakhāwī (in his *al-Ḍau' al-lāmi'*, ii, p. 101), relates that in A.H. 800 (1387–8) he received a sum of money which enabled him to engage in commercial enterprises with Yemen. He travelled backwards and forwards and became very rich. He died in 1425.

(7) Sirāj al-Dīn 'Umar b. 'Abd al-'Azīz b. Aḥmad al-Kharrūbi. Neither Ibn Ḥajar nor al-Sakhāwī mention in the biography of this merchant which trade he followed (see *Inbā'* f. 211b and *al-Ḍau' al-lāmi'*, vi, p. 92), but al-Sakhāwī calls him *al-khawāja al-kabīr al-tājir al-Kārimī* in the biography of his son Badr al-Dīn Muḥammad (*al-Ḍau' al-lāmi'*, viii, p. 246).

(8) Badr al-Dīn Ḥasan b. Ibrāhīm b. Ḥasan b. Ibrāhīm Ibn 'Ulaiba of Alexandria. He died in 1484 (Ibn Iyās ed. Kahle, iii, p. 202, and *al-Ḍau' al-lāmi'*, iii, pp. 90–1).

(9) Faraj Allāh al-Kārimī. This name is found in a Judeo-Arabic letter which was published in the Hebrew quarterly *Kiryath Sepher* (vol. 18, pp. 199 ff, p. 201). Unfortunately the date of the letter is incomplete, as the day and the month are given, but the year is omitted. The names mentioned in the letter leave no doubt that it was written in Egypt in the Mamluk period.

II

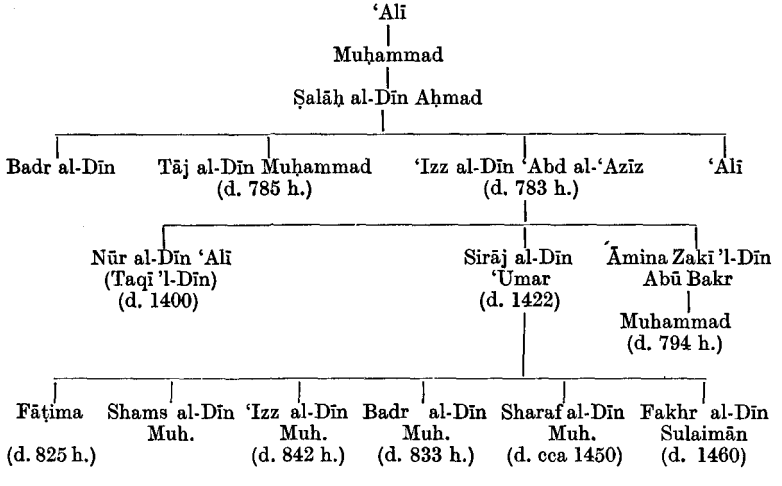
We gather from the sources that a good many of these wealthy merchants were parvenus. 'Izz al-Dīn 'Abd al-'Azīz b. Manṣūr began as a poor tailor. The two Kārimīs of the greatest renown made their fortune with their own hands. Ibn Ḥajar (f. 130b) says that Burhān al-Dīn al-Maḥallī was the son of a poor man and became extremely rich. The Sultan himself charged him with the management of his commercial affairs. Zaki 'l-Din Abū Bakr al-Kharrūbī belonged to a family of merchants, but he himself was in his youth poor until his uncle Badr al-Dīn died and he inherited from him a great sum (*Inbā*, f. 53a ; Ibn Qāḍī Shuhba, *al-I'lām*, MS. Paris, Slane 1599, f. 11b—who says, however, that Badr al-Dīn was his cousin). This heritage made it possible for him to engage

in great commercial undertakings. As Burhān al-Dīn al-Maḥallī he became the "merchant of the Sultan" and we read in Arabic chronicles that he was the greatest of the Kārimīs (al-'Ainī, *'Iqd al-jumān*, MS. Constantinople, Carullah 1591, f. 577b).

Parvenus of other periods and other countries did their utmost to better their social standing by contracting marriages with daughters of aristocratic families. Arabic sources show that the Kārimīs and other wealthy merchants of that time preferred intermarrying within their social group. This, however, is easy to understand. In the Mamluk society there was no real aristocracy of noble families who had held a privileged position during several generations. But trade on a large scale was monopolized by certain families. Among the Kārimīs listed by Fischel there are 'Abd al-Laṭīf b. Muḥammad b. Musnad al-Iskandarī and his son Yaḥyā who lived in the beginning of the fourteenth century. Of other families we also find two members: Nāṣir al-Dīn Muḥammad b. Musallam and Shihāb al-Dīn Aḥmad b. Musallam, Nūr al-Dīn 'Alī b. 'Umar al-Maḥallī and Burhān al-Dīn Ibrāhīm b. 'Umar al-Maḥallī. Even of the family of the al-Kharrūbī Fischel listed two Kārimīs, Zakī 'l-Dīn Abū Bakr and Nūr al-Dīn 'Alī b. 'Abd al-'Azīz. Yet we read in *Khiṭaṭ*, ii, p. 401, that Nāṣir al-Dīn Muḥammad b. Musallam's mother was a daughter of Shams al-Dīn Muḥammad b. Aḥmad al-Bālisī, whose name we added to the list of the Kārimīs. Nāṣir al-Dīn ibn Musallam too, is called al-Bālisī. Again, the family of the Ibn Musallam was connected with the al-Kharrūbī by the marriage of a daughter of Nāṣir al-Dīn. This we gather from the biography of Sirāj al-Dīn 'Umar b. 'Abd al-'Azīz b. Aḥmad b. Muḥammad al-Kharrūbī, an unhappy member of the Kārimī group, who several times inherited great sums, but had no success in his enterprises and left many debts when he died in 1422. According to *Inbā'* f. 211b, where his story is told, he married a daughter of Nāṣir al-Dīn Muḥammad b. Musallam. (This is omitted in *al-Ḍau' al-lāmi'*, vi, p. 92, but mentioned in the biographies quoted below.) She gave birth to three of his sons: Badr al-Dīn Muḥammad (d. A.H. 833 = 1429–30), Sharaf al-Dīn Muḥammad (d. *ca.* 1450), and Fakhr al-Dīn Sulaimān (d. 1460) (*al-Ḍau' al-lāmi'*, iii, p. 267, viii, pp. 246–7). In Ibn Ḥajar's chroncile f. 109a we find the obituary notice of Taqī 'l-Dīn 'Alī b. 'Abd al-'Azīz b. Ṣalāḥ al-Dīn Aḥmad b. Muḥammad b. 'Alī, who is qualified as *al-tājir al-Karimī*. Hence we have learnt that this man was the brother of 'Umar b. 'Abd al-

'Aziz ('Alī b. 'Abd al-'Azīz had two *laqabs*, Nūr al-Dīn and Taqī 'l-Dīn, and this explains the mistake of Fischel who thought that two persons are spoken of, s. p. 69 and 71). The father of 'Umar and 'Ali, 'Izz al-Dīn 'Abd al-'Azīz, who died in 783 A.H. (1381–2) (*Inbā'* f. 211b and cf. *al-Ḍau' al-lāmi'*, vi, p. 92), was surely the brother of Tāj al-Dīn Muḥammad b. Aḥmad b. Muḥammad b. 'Alī, (s. *Khiṭaṭ*, ii, p. 368). This Tāj al-Dīn died in Mecca in A.H. 785 (1383–4) (*al-Ḍau' al-lāmi'*, loc. cit.). A third brother, 'Alī, was the father of the famous Zakī 'l-Dīn Abū Bakr (op. cit., v, p. 240). Zakī 'l-Dīn had a son Muḥammad, who was a rich man and died, still young, in 1392 (*Inbā'* f. 211b).

The following is a Genealogical table of the family al-Kharrūbī :—



The al-Maḥallī were also a family of rich merchants. A certain Shihāb al-Dīn al-Maḥallī, who was the father-in-law of the Egyptian chief-judge 'Abd al-Raḥmān b. 'Alī al-Tafahnī (d. 1432), is said to have been the greatest merchant of Egypt in his time (*al-Ḍau' al-lāmi'*, iv, pp. 98 ff). The father of Badr al-Dīn Ḥasan b. Ibrāhīm Ibn 'Ulaiba, Burhān al-Dīn Ibrāhīm al-Munāwī (d. 1470), was an efficient merchant. His brother 'Abd al-Qādir was appointed by the Sultan his commercial agent in Alexandria. He died in 1485 (*al-Ḍau' al-lāmi'*, i, pp. 41–2, iv, pp. 259–60). These rich families built splendid houses on the shore of the Nile. It took seven years to build that of Burhān al-Dīn al-Maḥallī (*Khiṭaṭ*, ii, pp. 368–9). The house of Zakī 'l-Dīn al-Kharrūbī was rebuilt as a Khānqāh by the Sultan al-Malik al-Mu'ayyad Shaikh in 1941 (op. cit.,

pp. 426–7). The Kārimī merchants, like the Mamluk emirs, spent considerable sums for building madrasas and provided them with the revenues of estates and houses. The Arab historians relate that Nāṣir al-Dīn Ibn Musallam founded a madrasa for Shāfi'ītes and Mālikītes, with a school for boys (*Khiṭaṭ*, ii, p. 401). Burhān al-Dīn al-Maḥallī, too, built a madrasa, but avaricious as he was, did not allow funds for the payment of teachers and students (op. cit., pp. 368–9). These madrasas were built near the houses of their founders, e.g. that of Burhān al-Dīn al-Maḥallī, or even located within the mansion of the founder, e.g. that of Tāj al-Dīn Muḥammad al-Kharrūbi (ibid).

However, no conclusions should be drawn from the reports on the great wealth of the Kārimīs as to their social and economic power. These would be exaggerated and not be in accord with the reality of the Mamluk period. Within the framework of the Mamluk state there was, in general, no place for patrician families who might have enjoyed great power and influence for a long time. The authorities would, sooner or later, have ruined them by their system of contributions and confiscation of the inheritance. As a matter of fact, we do not hear of a family of Kārimī merchants who remained rich more than two or three generations. This is strikingly substantiated by the history of the al-Kharrūbī family. There were in this family three generations of wealthy and enterprising merchants; the fourth was poor. Al-Sakhāwī is very outspoken on this point. The first generation is represented by Ṣalāḥ al-Dīn Aḥmad b. Muḥammad b. 'Alī, the second by 'Izz al-Dīn 'Abd al-'Azīz, the third by his nephew Zakī 'l-Dīn Abū Bakr and by his son Nūr al-Dīn 'Alī. The Arabic historians call Nūr al-Dīn 'Alī the last of the Kharrūbī merchants of Egypt—*ākhir tujjār Miṣr min al-Kharāriba* (*apud* Fischel, p. 71, and *al-Ḍaw' al-lāmi'*, v, p. 240). The reports on the family of Ibn Musallam are conflicting. Maqrīzī relates that the father of Nāṣir al-Dīn Muḥammad b. Musallam was a porter and later became a "travelling merchant" (*tājir saffār*) (*Khiṭaṭ*, ii, p. 401). But Ibn Ḥajar says that both his father and his father's father were wealthy and successful merchants. An uncle of his was, according to *Inbā'*, f. 17a, extraordinarily rich. If that is true, there were three generations of effective and rich traders in this family too, for the sons of Nāṣir al-Dīn lost their money. The history of another famous merchant family, as outlined in the biographical dictionary of al-Sakhāwī, reveals the same picture

(see the biographies of the Damascene merchants Shams al-Dīn Muḥammad b. 'Alī b. al-Muzallaq (d. 1444), his sons Sirāj al-Dīn 'Umar (d. A.H. 841 = 1437–8) and Badr al-Dīn Ḥasan (d. 1474) and his grandsons Ibrāhīm (d. A.H. 879 = 1474–5) and Shams al-Dīn Muḥammad, in *al-Ḍau' al-lāmi'*, i, p. 41, iii, p. 126, vi, p. 120, viii, pp. 173–4). It should be stressed, however, that it was not the Mamluk government, at least not directly, which brought about the downfall of the Kārimī families. They were not ruined by contributions, but by the consequences of the development of the Egyptian economy as a whole. It seems that the Mamluk government, at any rate that of the Baḥrītes, adopted a more lenient attitude towards the Kārimīs because it was interested in the revenues from the spice trade.

Naturally we should like to know the number of the Kārimī merchants. It surely underwent changes from time to time according to circumstances. We are indebted to Ibn Ḥajar who provides us with interesting and reliable information on this question. He says (f. 16a) that he found a note of the merchant al-Fāriqī of Zabīd that in the beginning of al-Malik an-Nāṣir's reign there were more than 200 Kārimīs in Egypt and that they had more than 100 employees who travelled overseas for them. To evaluate this report, it should not be overlooked that in the period in question (the beginning of the fourteenth century), the size of the Egyptian spice trade was limited to some extent owing to the effort of the Pope, after the capture of Acre, to weaken the economic power of Egypt by deflecting the commercial relations with the Middle East to other ports than hers.

In the Arabic sources no details have so far been discovered on the supposedly guildlike organization of the Kārimī merchants. This is a crucial point of the problem. There can be no doubt that they formed a special group of great business-men who co-operated in some way or other. But should we infer from the titles of "chief of the Kārimīs" and similar ones given to leading Kārimī merchants that there was a firm organization with grades, such as chief, simple member, etc., as does Fischel (p. 70)? Such titles found in Arabic chronicles and biographical dictionaries of the Middle Ages are perhaps not to be taken too literally. The Arabs were accustomed to bestow these titles lavishly on outstanding members of any social group. The most learned scholar of the Shāfi'ī jurisconsults of Egypt was called *ra'īs al-shāfi'īya bi-Miṣr*, and it would be erroneous to deduce from this title that there existed an organization of the

Shāfi'ī doctors. But surely this prominent scholar was consulted when a judge for the adherents of his school (*madhhab*) was appointed and even in other cases he exerted great influence. It should be borne in mind that our ideas of social organization, inherited from the Romans, were not familiar to the medieval Orient. Most of the social institutions were not built up on well defined rules, nor did one cling to rules established in practice. The *Futuwwa* associations had their rules, but they originated in a religious background which was missing in the case of the Kārimīs. Furthermore the group-life of the akhīs was a series of ceremonies and they could not help but appoint officers for celebrating them. The Kārimīs may have been a loose confederation of merchants bound together by mere professional interests. We may be sure that the richest and most esteemed Kārimī always decided on questions which gave rise to dissension, that he, with some other prominent members of the group, represented them before the government, and that his authority was recognized by all the Kārimīs. But there need not have been written statutes, such as the Westerners used to have.

III

Another question not yet solved is that of the rise and the decline of the Kārimīs. Various reports on their activities point to the period of the Baḥrī Mamluks and the two decades after it as the time in which they flourished. But when did their rise begin? Fischel quotes Maqrīzī who relates in his *Sulūk* (i, pp. 72–3) that the Kārimīs came to Egypt in 1181 and had to pay taxes for some years. The Egyptian historian does not say, however, that they came for the first time in that year. Due attention should be paid to a statement in Qalqashandī's *Ṣubḥ* (iii, p. 524) where he says that the Fatimids had a fleet in the port of 'Aidhāb which was charged to protect the Kārimī ships from pirates. That the Fatimids made great efforts to divert the spice trade from the Persian Gulf to the Red Sea and established commercial bases on the way to India is well known. (The place of commercial relations in Fatimid policy was discussed in a recently published paper of B. Lewis: "The Fatimids and the route to India," *Revue de la faculté des sciences économiques de l'université d'Istanbul*, 11, pp. 50–54.) At any rate, it is remarkable that the spice traders' ships are called Kārimī ships in this passage.

Under the rule of the Baḥrī Mamluks, the Kārimīs apparently

monopolized the spice-trade between Yemen and Egypt or at least their preponderance was overwhelming. There was a great difference between the Indian spice trade of the Fatimid and the Mamluk periods. The small capitalists previously engaged in it were gradually supplanted by the Kārimī merchants who accumulated enormous wealth. This was the result of the economic policy of the Mamluk government, which oppressed the small traders by its system of taxes and monopolies. We do not hear, however, that in the first half of the Baḥrī period the Mamluk government asked the Kārimīs to raise funds in case of emergency. In the middle of the fourteenth century their economic power rose more and more. They had a great international bank in Cairo which gave, in 1351 and 1352, huge loans to a Yemenite king imprisoned by the Sultan of Egypt; they were certainly payable in Yemen (*al-Nujūm al-zāhira*, ed. Popper, v, pp. 89–90, 117). Even the Egyptian government began to apply to them for financial help. In 1352, when the Syrian governors had revolted and the Sultan needed funds for a military expedition, the vizier received orders to take a loan from the merchants. Apparently the Kārimīs opposed the government's demand, for our source goes on to relate that they bought certain products from the Sultan at their real value, thus providing him with the necessary funds (op. cit., p. 121; this passage was misunderstood by Fischel, p. 77, who speaks of a loan to the king of Yemen). Once more the Mamluk government had shown a remarkable leniency in its relations with the Kārimī merchants, since we read in our source that some state officials were laid under heavy contributions to be paid in cash. At the end of the fourteenth century, under the rule of Sultan Barqūq, the power of the Kārimīs and their influence came to their peak. At that time they played a rôle comparable to that of the great bankers of Baghdad in the Abbasid period and of the Mādharā'īyūn of Egypt. When the government, which became more and more impoverished, had to prepare a military expedition, it borrowed great sums from the Kārimīs. We hear that they lent to Barqūq a million dirhams in 1394 when an invasion of the Mongols was imminent and the Mamluk government decided to send troops to the Syrian border (*al-Nujūm al-zāhira*, v, p. 562). In 1403 Christian raiders attacked Alexandria and an expedition had to be organized to protect the chief port of Egypt. Burhān al-Din al-Maḥallī, the renowned Kārimī, contributed a great sum to its cost (*Inba'*, f. 125a).

But it seems that a short time later the riches of the Kārimīs vanished. The general breakdown of the Egyptian economy in the beginning of the fifteenth century probably ruined the Kārimīs too. The outstanding Kārimī merchants of the end of the fourteenth century are, in the Arabic sources, called "the last Kārimīs". To the passages quoted by Fischel (p. 71) a note in al-'Ainī's *'Iqd al-jumān* (f. 577b) may be added: the chronicler says that Zakī 'l-Dīn Abū Bakr al-Kharrūbī was the last of the Kārimīs in Egypt and with him they disappeared from the scene. Again, this should not be understood literally. Five out of nine Kārimīs whom we have added to Fischel's list lived in the fifteenth century. Further, in the chronicles of this period, we find reports on the appointment of officials charged with the collection of the Kārimīs' taxes (*Inbā'*, f. 256a). In general there is no reason to suspect that expressions like Kārimī merchants or Kārimī trade are mere equivalents of spice traders and spice trade in sources of that period, although sometimes this may be the case. Yet the new material does not contradict Fischel's opinion on this point. The end of the fourteenth century was the great time of the Kārimīs, whereas the merchants of the fifteenth century called Kārimī seem to have been men of moderate wealth. The economic decline of Egypt and the ever growing pressure of the Mamluk government, which controlled the spice trade and participated in it, encroached on the activities of these merchants. But even in this period the Kārimīs were not annihilated, because both public opinion and the government were aware of the importance for the economy of Egypt of their spice trade. In 1429–30 an epidemic ravaged the country and when the Sultan Barsbāy asked the leading theologians about the causes of the disaster, they mentioned, among others, the measures taken by the government against the Kārimī merchants (*Inbā'*, f. 235b).

IV

The conclusions reached so far confirm some of Fischel's inferences and refute others. Fischel expressed the opinion that the Kārimīs were a group of merchants engaged in the spice trade between Egypt and Yemen. But, without doubt, there were also Kārimī merchants in Damascus. The first Kārimī merchant of our additional list was a Damascene and pursued his commercial activities both in Damascus and in Cairo. True, Ibn Kathīr does not say explicitly that Ibn al-Ruhā'ilī died in Damascus, but this may be taken as sure, since

the chronicler does not state the contrary. We may also infer from Qalqashandī's exposé of the Mamluk administration of Syria that there was a group of Kārimī merchants in Damascus. In the list of administrative officers of the province of Damascus there appears an "inspector of the zakāt-tax (*shādd al-zakāt*) with the task of dealing with the Kārimī trade and the like" (*Ṣubḥ*, iv, p. 187). That this passage reveals the state of affairs may be gathered from the fact that such a post is not included in the tableau of the administration of Aleppo, nor in that of any other Syrian province (ibid., pp. 217 ff).

Further, Fischel believes that the Kārimīs were an exclusively Moslem group of merchants. This opinion is clearly refuted by a record in a Judeo-Arabic document reading: "There departed among the Kārimīs of our comrades the Jews" (British Museum Or. 5549, iii, f. 5r, see Catalogue of Margoliouth no. 1135, pt. iii, p. 563). There was certainly no reason why the Kārimīs should not have admitted Christians and Jews to their company. J. Mann published in his work "The Jews in Egypt and in Palestine under the Fatimid Caliphs II," p. 246–7" two Genizah documents which contain apparently lists of tax-payers or people who collected a fund. There appear in one list al-Kārimīn—50 (p. 247) and in the other list where no shares are given: al-kurrām hā-arbā'āh (the four Kārimīs). The quota 50 is remarkably greater than those of other people mentioned in the list. These are documents of the eleventh century.

Lastly, Fischel's assertion as regards the extent of the Kārimīs' business should be modified. The spice trade was their domain, as is explicitly stated in various Arabic sources (e.g. *Ṣubḥ*, 13, p. 341). But this should be taken *cum grano salis*. For besides the spice trade and banking, these great merchants were engaged in other fields. The goods bought by the Kārimīs from the Sultan in 1352 (s. above) were agricultural products of his estates. Another report on the Kārimīs' business in Maqrīzī's *Khiṭaṭ* (ii, p. 401), is not less clear. The Arab writer reports that Nāṣir al-Dīn Muḥammad b. Musallam had many employees and sent one of them to India, another to the Atlantic coast of Africa, a third to Abyssinia and some to other parts. We are probably not mistaken in deducing from this report that Nāṣir al-Dīn was a great slave trader. For what else did he import from Abyssinia and West Africa? Furthermore, we learn from Maqrīzī's statement that the Kārimīs did not refrain from travelling

to India or sending their employees there. The life-story of 'Abd al-'Azīz b. Manṣūr, as told by Arab historians, points to the same fact. This Kārimī merchant is sometimes called "al-Kūlamī", i.e. the man who travelled to Kūlam, the well-known sea-port of Malabar (*Sulūk*, ii, pp. 132–3). Some sources indicate that he made five voyages to China. Ibn Ḥajar says in his *al-Durar al-kāmina* (ii, p. 383) that he began his career as merchant with a voyage to the land of Cathay and brought a great quantity of silk from there to Aleppo. A chronicler of Yemen relates that he came to Aden in the year A.H. 703 (1303–4) on his way from Cathay and China and brought silk, moschus, porcelaine, slaves, etc., with him (al-Khazrajī. *al-'Uqūd al-lūllū'īya*, i, p. 350).

BASIC FEATURES OF THE ECONOMIC FORMS OF BABYLONIA IN THE FIRST MILLENNIUM B.C.

Michael Jursa Introduction

The following overview of the economic structures in southern Mesopotamia in the first millennium BC and the discussion of long- distance trade as a possible medium of cultural exchange between this area and the eastern Mediterranean region (with regard to the general theme of the symposium) are, in view of the wealth of material and the breadth of the topic , partly thesis -like with only exemplary , not exhaustive documentation. We will restrict ourselves to the essential basic features and will only address a few of the numerous open questions .

1. The economy of Babylonia in the first millennium BC

1.1.

Sources Both the archaeological and epigraphic documentation for the period in question are rich overall , but diachronically and geographically unevenly distributed; the coordination of archaeological material with philological findings remains a problem that is only partially solved . Adams' survey of large parts of the southern Mesopotamian alluvium still offers the decisive archaeological starting point from which the overall economic development must be understood (Adams 1981) . A significant increase in settlement density has been noted compared to earlier periods , in particular a disproportionate (ninefold!) growth of larger (urban) agglomerations of more than 10 hectares of settlement area (Adams 1981, 177ff.). According to the survey findings, this growth continued continuously from the Neo -Babylonian period to the Seleucid-Parthian period (roughly 700 BC to 200 AD) and culminated in what was postulated according to Adam's model as a widespread agricultural

2

A detailed elaboration of essential questions in this context is being carried out within the framework of our START project The Economic History of Babylonia in the First Millennium BC , financed by the Fund for the Promotion of Scientific Research (Vienna). Quotations from unpublished texts from the collections of the British

Museum are made with the permission of its trustees . Unpublished material from the Yale Babylonian Collection is used with the kind permission of B. Foster and U.

Kasten . I would like to thank E. Frahm and G. Milller for allowing me to cite unpublished works , and M. Weszeli for reading the manuscript .

The occasional repetition of what is known or has been said elsewhere does not seem to be unnecessary in view of the often underestimated potential of ancient Near Eastern sources to contribute to the general discussion about the *Ancient Economy . See, for example , the relevant statement by Cohen 2002, 3, where the statement by Kuhrt 1998, 16(sic), which quite clearly means that it is possible to speak sensibly about commercial practices in the ancient Near East , is turned into its opposite by abbreviated quotations .

Machine Translated by Google

ical use of large parts of the southern Mesopotamian alluvium in the Sassanid period (Adams 1981, 181): overall, an impressive picture of constant agricultural expansion and continuous demographic growth, which is admittedly not without problems . Not all relevant regions were investigated with the same intensity or at all , and the dating based on the (largely unpublished) ceramic findings is necessarily imprecise. The model therefore requires philological confirmation, clarification and correction.

The chronological distribution of the written sources is also notoriously inconsistent: information up to the beginning of the seventh century is sparse. Much material has been preserved from the sixth and fifth centuries , but in the following centuries the documentation decreases again continuously . From the fourth century onwards, not only does the number

of texts decrease steadily , but there is also a narrowing of the topics covered in the documents . Only in the sixth and fifth centuries could one hope to obtain an almost complete overview of the Babylonian economy ,

- and even at this time , as will be shown shortly , one would be disappointed . The following will deal mainly with the period between the sixth and fourth centuries , although it should be emphasized that in many respects the conquest of Babylonia by the Persians did not represent a turning point in economic terms .

Despite these limitations, Babylonia in the first millennium BC is one of the best-documented regions of antiquity through written sources ; the number of relevant texts in Western museums is almost in the six-digit range. Of course , as in all other periods of Mesopotamian history, the basic rule applies here that the written sources only illuminate part of the social and economic reality. Not all strata of society have the same level of access to and motivation for using writing : urban elites are a dominant , if not the only, focus of the sources . In addition , only those transactions are recorded in writing that could be referred to in the future . In the given

case, this means that , for example , exchange transactions Connection, such as incontestable cash purchases of goods normally remain invisible

- the crucial question of the extent of market exchange in comparison to other forms of transaction can therefore only be answered indirectly .

3 Dandamaev 1984, 7ff. gives a convenient overview for the seventh to fourth centuries, the importance of which is not significantly affected by material that has become known since then .

4 8. Oelsner 2003 with further literature,

See van de Mieroop 1997 .

6 _ In private archives, purchases of this kind can only be proven if either payment or

delivery is credited . The documentation in the administrative temple archives is more detailed in this regard .

1.2. Basic features of the economy in the alluvial flood plains of southern Mesopotamia7 The economy of southern Mesopotamia in ancient times was based primarily on irrigated agriculture in all periods . The labor-saving use of the seed plough in an extensive farming regime enables high yields in

relation to the seed used . The main limiting factor is usually not the availability of land, but that of water. Agriculture is in a symbiotic relationship with small livestock farming , which is carried out using the grass steppe primarily by

(semi)nomadic sections of the population and whose most important product by far is wool . Textile production is considered to be an important branch of industry in southern Mesopotamia; it plays a decisive role in the long-distance trade that is essential for resource- poor Mesopotamia .

Regular agricultural surpluses and low transport costs (through the network of canals) enable economic concentration, which leads to the formation of locally dominant large economic entities (households, oikoi) in usually religious guise (“temples”) . The economic form of these institutional households has been described as (largely) closed household economies : ideally they are economically self -sufficient.

Production is managed centrally , the proceeds are collected in stores and redistributed to the staff . The economic potential of these households to generate surpluses is of eminent political importance for the rulers (and their palace households , which rely more heavily on tribute) . Their activities and resources require constant (written-based) supervision and are always at

the forefront of written documentation .

This should not , however, lead to the false conclusion that the institutional economy is the same as the economy as a whole . Private land ownership by wealthy townspeople is almost always well attested, and there are good reasons to postulate the existence of small settlements of (largely) independent subsistence farmers who played an important role as a reservoir of labor for institutional households at certain times of the year , such as during harvest time .

1.3. Special features of the first millennium?

If one wants to classify the first millennium BC in the described economic / ongue durée of Mesopotamia , the same economic actors as in previous millennia must be noted. The institutional households , palaces and temples, still play a major role in the documentation . The temples are admittedly much better documented by three large and several small archives than the palace sector of the economy.® This can almost only be accessed through indirect information . An important third element -

7 _ For this (simple) model see e.g. Liverani 1998 , van Driel 1998, 1999, 2000, 2002, Jursa 2002a. ®

_ The most important temple archives are those of Ebabbar of Sippar and Eanna of Uruk, mainly from the sixth and early fifth centuries (Pedersén 1999, 193, 205ff.) with over 30,000 and over 10,000 tablets respectively , and the much smaller archive of Esangila of Babylon with a few hundred texts , mainly from the fourth and third centuries

(provisionally Boiy 2000, 25ff. and 6.).

Machine Translated by Google

ment within the institutional economy, alongside palaces and temples, are the rural settlements of those obliged to serve the state. This form of land use is best documented for the Achaemenid period, but it can also be proven in the Neo - Babylonian period and has clear precursors in the second millennium . The system secures workers and soldiers for the state . In addition , it serves on the one hand to develop unused institutional land , and on the other hand to integrate closed groups of non - Babylonians , especially non - sedentary people , into society and the state structures . Private archives in Babylonia

in the first millennium were also left behind predominantly by the urban upper class with land ownership in and near the cities and often with connections to the institutions , especially to the sanctuaries.'®

With regard to the economic forms, one would first like to establish a fundamental continuity . The temples are still the best example of a redistributive economy, the royal household or the palace also has, as before , both redistributive and tributary features . The institutions are interwoven with the private sector through the activities of entrepreneurs who manage certain parts of the institutional economy on their own account and at their own risk and pay the institutions a flat fee for this . Such business relationships can

be traced back to the Old Babylonian period , for example , in a form that is essentially completely identical . " In general, the same economic activities can be observed among the urban upper classes as in earlier periods: the main sources of income are land ownership,'* trading in tcmpclpfi', interest- bearing loans* and , last but not least , various business ventures that are run alone or in partnership with others . *

Must we conclude from all this that there was nothing new in the first millennium? No. The main difference to earlier periods of Mesopotamian history lies in the weighting of the individual economic forms. We are only at the beginning of a fairly serious quantification , but some patterns are already emerging .

1.4. The institutional households

The usual model of a redistributive economy paints the picture of an almost closed circle: The institutional household produces what it needs; the goods are centrally managed and redistributed. Any surpluses are used to trade in prestige goods and materials not available in the country , such as metals . This model does not stand up to scrutiny on the basis of the Neo-Babylonian temple archives in essential points .

Special attention is given to van Driel 2002, 226ff.

9 10 Pedersén (999, I8HF) names some of the better known archives. Representative studies of individual archives:

All the forms of transaction required by the model can be demonstrated, but their importance is unexpected. The agricultural production of institutional households is used commercially to a significant extent , including for the purchase of other agricultural goods. There can therefore be no talk of self- sufficiency even with regard to meeting basic needs .

Despite the inherent difficulties of quantification attempts and the numerous unanswered questions, this can already be illustrated today using the North Babylonian Ebabbar and the South Babylonian Eanna . The Ebabbar archive is the largest Neo-Babylonian archive. In the 6th century , the density of sources is greatest here and therefore the probability that quantification studies will lead to useful results is also greatest.'® Three peculiarities show that the economy of Ebabbar differs in essential points from the model of the closed household economy described above .

The first point concerns the focus on temple agriculture , the main branch of production. There is obviously a conscious investment in intensive date gardening at the expense of extensive arable farming .

In principle , the Ebabbar follows a trend that can also be observed further south , in the region of Babylon and Borsippa ,' but the intensity with which

this happens is remarkable.'® The reason for this - and this brings us to the second point - is that a large part of the date harvest was not consumed internally , but was sold . It is only rarely proven that this was just the utilization of accidentally accumulated residues in the stores , '® and the large number

of receipts for individual date sales , especially for silver , leaves no doubt that these were routine transactions.® Often the dates do not even reach the temple stores , since the entrepreneurs who are tasked with collecting the harvest sell part of the harvest themselves and only pay the temple the silver.'® At the moment it is not possible to estimate with any certainty exactly how high the proportion of the total harvest was that of the dates sold and whether there were diachronic fluctuations . However , that a significant part

of the harvest was affected is demonstrated by texts such as CT 57, 22, which at least attests to the sale of just under 5 % of the estimated total harvest of the temple 's date gardens in a single transaction . Date sales are generally much better attested in the archives than

21 Passim , for example, for agricultural tithe tenants: Jursa 1998, 39f., 51f. and 6. Something

similar can also be proven for the benefice gardeners, the rab-bané : VS 4, 14,

22 BM 63906, silver for 426 Kor (ca. 60 t) of dates, paid by the general obligor Ana-amit-Bél-atkal, who, according to BM 61774, had to deliver 10,000 Kor (ca. 1,400 t) of dates for all

of Ebabbar 's date gardens (Jursa 1995, 88).

Machine Translated by Google

Barley sales - evidence of the stronger market orientation of date horticulture compared to barley cultivation .

The silver income from the date sales was primarily used to buy livestock and natural products such as barley or sesame . Ebabbar 's own herds seem to have been far from sufficient to cover demand . Specialization in date cultivation therefore helps to compensate for weaknesses in other areas of the temple economy .

A similar economic specialization can be observed in the Eanna archive . Here, the sale of wool is the main source of silver income and is also used to finance wholesale purchases of goods . Among the buyers are not only individuals , some of whom can be identified as merchants , but also institutions such as the palace in Babylon or the governor of Mesopotamia.® The wool trade of the Eanna is also of interest from the point of view of Mesopotamian long -distance trade ; see below .

The silver income generated by the two temples through economic specialization was used not only to purchase agricultural fences and livestock , but also to procure labor - this is the third point where significant deviations from the traditional oikos model can be observed . The Ebabbar was dependent on hired labor for two - thirds to three- quarters of its larger construction projects . Unlike an institution of the third millennium , the temple 's own staff and the people who could be mobilized through dependency relationships were not numerous enough to even come close to handling the tasks at hand.® The Eanna was no different .

A further administrative and economic innovation follows from what has just been described. As early as the 6th century, a certain monetization was already evident in the core area of the redistributive temple economy, in connection with the distribution of benefice income and sacrificial materials : instead of goods in kind , silver was often paid out, which either served as a substitute for income or was used to buy sacrificial materials .

23 Typical is CT 57, 206: 5-10, according to which dates are sold for silver and barley . 24 See the overview in Bongenaar 1999,

25 A detailed investigation will be given in the framework of the project mentioned above .

Here are just a few references for illustration: JCS 24 , 105 UNC 14; ZA 66, 286ff. YBC

4141 and YBC 4012; ZA 67, 43ff. YBC 4038 and YBC 3740; NCBT 191; NBC 4859.

26 This can be demonstrated by a dam construction project north of Sippar , which was carried out in the

bar archive is well documented : Jursa 1995, 184ff.

27 Some letters show this very clearly. In NCBT 38 , for example, it is stated that only a quarter of the

The earthworks required for a specific project were carried out by the temple's own personnel , and the rest was dependent on expensive hired workers . YOS

3, 69 documents exorbitant wage demands (six shekels per month) from hired workers who were obviously aware that the temple administration had no alternatives to their services . The struggle for labor at the temple is not in

contrast to the general population growth that can be seen from the archaeological findings (cf. van Driel 2002, 219), but is based on the generally weakened

position of the temple households in the first millennium .

Machine Translated by Google

are.® This is the beginning of a development which ultimately leads to the Rahimesu archive in Babylon in the early first century BCE .

Even in the context of the temple economy, wages and rations were generally paid or at least calculated in silver .

The dependence of the institutions on free hired workers, the extensive integration of important branches of production into the market economy, money- based exchange and the associated economic specialization mean that the model of a redistributive, self - sufficient household, i.e. the classic oikos model, is not suitable for adequately describing the economic forms of the Neo- Babylonian temples . There can be no talk of autarky ; the continuity compared to earlier periods is only apparent.

1.5. The private

sector With regard to the distribution of economic forms that one encounters in the non-institutional area, i.e. primarily among the urban upper class, two types can be distinguished , a rentier type and an entrepreneur type . The rentier uses existing, normally disposable capital, primarily land and temple benefices. If surpluses are generated over and above immediate personal needs , these are invested in additional land or benefices, and possibly also in small interest-bearing loans . Larger property movements usually only occur in connection with inheritance or marriage. Having land and the necessary means of production at one 's disposal means security , and prestige too . People therefore do not normally part with inherited land or benefices. The numerous purchase contracts for

gardens, fields or benefices that have been preserved are not a counter-argument . In those cases where the background to the transactions can be ascertained through larger dossiers , it is usually shown that these are forced sales due to distress . This is true even though , in purely mathematical terms, an investment in trading companies or in credit transactions could have yielded greater profits than an investment in land .* Moreover , there are indications that the economic

28 Sippar: e.g. Cyr. 33, 206; CT 57, 97, 177, some further evidence in MacGinnis 1995, 1411., 146, 148f. Sesame is bought in particular : Rongenaar 1997, 262°*% Uruk: e.g. GCC1 1, 198. 362, 379; GCCL 2, 2115 ZA 67, 48f. YBC 3740; Sack, Cuneiform Documents 55, 1u.vam

29 Van der Spek 1998, 247.

30 These are terms that ultimately go back to Pareto . Weber 1980, 178 differentiates pensioners

as typical representatives of positively privileged property classes from entrepreneurs, members Lpositively privileged employment classes®

31 For land purchases see 2. B. Wansch 2000a, [43ff. (Bgibi archive), 2002, 241ff.; several recent examples in the still largely unpublished Sangi-13tar-Babifi archive from Kutha (after the fifth century BC). The same applies to purchases of benefices , but here the evidence is not so easy to provide due to the lack of larger dossiers on individual transactions .

32 The benchmark here is the usual interest rate on loans, 20 % per annum . Business companies with the usual profit-sharing clause should therefore be able to generate at least 40 % in order to make them attractive to investors . The few clear pieces of evidence support this theoretical assumption (Lanz 1976, 138£.; cf. also Joannes 1999, 188 to YOS 6, 52 on the profitability of foreign exchange companies). When

investing in

Machine Translated by Google

Reciprocity within the group also played a role in the actions of these people : this is supported above all by marriage patterns, but also by certain peculiarities in the granting of loans to members of the same social class.® The economic strategies and the mentality of the rentier type are obviously shaped by the requirements of a subsistence economy that was originally aimed primarily at self-sufficiency .

The investment patterns of the entrepreneur type are completely different : here you find partnership agreements for commercial purposes, from (domestic) trading companies to running an inn, here you find relatively high levels of interest -bearing loans, here you find targeted market-oriented cultivation of certain agricultural niche products both on your own and on other people's land . Crafts or the craft use of slaves, usually on a small scale , as home work , also falls into this category.

The ownership of a few male and female domestic slaves for this purpose and for general auxiliary services is widespread in this

social class , as it is among rentiers , although families with dozens of slaves , such as the Babylon branch of the Bgibi® family , are exceptions.

The most characteristic activity of Babylonian entrepreneurs is the entrepreneurial management of and economic activity with foreign capital .

Zen each other in the private sphere the needs of the rentier and the entrepreneur

According to Joannds 1989, 97ff. , date gardens, the most productive form of land ownership, can

only expect a yield of around 14 % per annum (these figures require further verification).

33 We retain the traditional terminology for transaction types , which goes back to

Polányi , although Sahlin's gradual reciprocity scale , which includes all forms of economic exchange from gifts to loot , is a model that is better adapted to reality (von Reden 2003, 3).

34 This is most clearly seen in families of temple beneficiaries , who consistently entered into marriages with one another . See , for example , Bongenaar 2000, 84f., Jursa 1999, 36f. Special cases are (sometimes levirate-like) endogamous ehons, which are concluded on

the basis of inheritance law considerations : Joannes

1987, Waerzeggers 2002, 35 At least in the Böl-römanni archive, silver loans, especially

interest - bearing loans , were usually taken out from outsiders . This leads to the assumption that taking interest from members of the same group was avoided as far as possible (there is of course no ban). Smaller interest-free consumer loans within the group, which certainly did exist , must have been made without writing at least in the Böl-römanni . Jursa 1999, 124f. Other archives still need to be examined for these questions ,

36 Lanz 1976. Overview of the represented branches of industry 139ff , e.g. Wunsch 2002.

38 This is attested in the Nür-Sio/Egibi archive : Wunsch 1993, Jursa

1995/96, 39 A question that still needs to be examined in more detail is whether and

to what extent craftsmen and entrepreneurs in general are attested who have no or even no significant agricultural land ownership - a distribution of property that amounts to a fundamental departure from the traditional subsistence patterns of the urban upper

class . S, below note 59 40 Around 100 slaves named are divided between the parties in the inheritance deed Dar , 379 from this archive (see Wunsch 1999 and 6.) .

economic forms of Babylonia 123

neurs.! Above all, however, there are points of contact with the institutional economy, which is dependent on such entrepreneurs in essential areas .* The spectrum ranges from state tax leases to agricultural general leases of temple and royal land to the administration of temple funds by Babylonian and non - Babylonian bankers from the third century onwards.®

The economic mentality of entrepreneurs is obviously different from that

of rentiers. This is not to be expected , since very different economic niches are occupied . Unfortunately , we do not have such obvious evidence as in

Old Assyrian, where a merchant is told : You own the money. However , there can be little doubt that this statement would have applied just as well to a Neo-Babylonian businessman . These people act in a competitive environment with an obvious focus on profit.® Excessive pursuit of profit at the expense

of others was , of course, considered morally reprehensible according to

some Fiterarian evidence ; isolated evidence in documents explicitly testifies to the renunciation of profit out of pity for debtors . Such things would have been rare , but the few pieces of evidence do at least help to nuance our picture of the prevailing economic mentality.®

In reality , of course, these two ideal types are never represented in their pure form . In almost all archives there are elements of both types, but never to the same extent; always either one or the other predominates . Therefore, the distinction has a heuristic value .

Useful diagnostic criteria are, on the one hand, temple benefice ownership and related business activities , and , on the other hand, corporate or harrdnu enterprises. Archives in which the content emphasis is on one of these two categories usually contain little or no evidence for the other category. Temple benefices are predominantly in the hands of long-established families with close ties to the local temples, who form the traditional upper class of the Babylonian cities . Business activities are limited in these

41 This is the case with partnerships with one-sided capital participation (Lanz 1976, 73ff.) or with private service contracts (Kesster 1991, 921, Jursa 1999, 44ff.), $.

42 Bongenaar 2000, a collection of essays devoted to this intertwining of private and institutional economies , which is typical for Mesopotamia . Jursa 2002a is an attempt at a synthesis in this regard .

43 Beaulien 2000, van Driel 1999b and Wunsch 2000b give examples for most types of Neo -Babylonian entrepreneurship ; for banking in the Hellenistic period see Jursa (n Vorbercitung).

44 Larsen 1982, 214,

45 Their good understanding of the economic and non - economic conditions under which

they have to conduct their business is usually only indirectly evident from the documents

The most important exception is TCL 13, 182 from Uruk, in which different conditions under which a general lease is to be concluded are weighed against each other (van Driel 1999 , 216£). - * Profit must of course be defined (vel. Morris

2002). The understanding of the word that we have in mind here is entirely (and consciously) mo- this, of course , not on the basis of a d priori assumption, but on the basis of our understanding of the Quetlen, cf. below note 73.

Machine Translated by Google

In these circles, the focus is generally on the area of the benefice, at most

one finds money lending on a small scale and agricultural businesses of a moderate size in addition to the cultivation of one's own land : Most temple benefice holders are typical

rentiers. In comparison to this group, entrepreneurs are much more difficult to classify socially.® In the sixth and early fifth

centuries , the majority came from the urban upper class, that is, the group in which the indication of (fictitious?) ancestral or family names,? Some of them date back to the second millennium , but not a few others are obviously

outsiders, homines novi, and some of them are not of Babylonian origin."' In isolated cases, unfree persons can also act as entrepreneurs . * Archives of the rentier type are

much more numerous overall . In the future, a diachronic study should be carried out to determine under which conditions entrepreneurs of the type described appear more frequently and which conditions are not conducive to them . A useful model could be provided by Le Roy Ladurie's well - known work on Languedoc in the 15th to 18th centuries , in which he makes a similar distinction to the one proposed here and correlates the distribution of the two types with the secular fluctuations in agricultural productivity (and population) - these are cycles that may well have existed in Babylonia in the first millennium BC ; at least this is what the still - present unpublished work by Gerfrid Müller on price information in Neo-Babylonian texts .*

1.6. The State, the Market and Economic Growth The

role of the state, or royal administration, can be underestimated both during

the Chaldean period and later in the Achaemenid period due to the lack of relevant

47 Some examples: the private archives from Uruk examined by Kessler (1991), the Balrömanni archive (Jursa 1999), the archives of the Ha-ilita-bani family (Joanns 1989) and several other (mostly still unpublished) archives from Borsippa (collected for the

48

project mentioned by C. Waerzeggers). Exceptions are some general registrars of Tempelland , who are also integrated into the benefice system (Joanns 2000, 40, 31, Jursa

1999, 3772). See the considerations and evidence in Joannes 2000, 36-40.

49 Lambert 1957, Ungnad 1935,

50 Examples are the famous Egibis (Wunsch 2000a ete.) or (ddin-Marduk from the Nür-Sin

family (Wunseh 1993). However, unlike the vast majority of the beneficiaries, the

entrepreneurs do not always come from long-established local families. The most important general tenants in Uruk, for example, almost certainly came from Babylon (cf. Jonants 2000, 38).

An example is Ana-amät-Böl-atkal, the first general tenant of the date gardens of Ebabbar in Sippur, whose father Nabü-dafä has an Aramii name (Jursa 1995, 88).

52 Compare the three general tenants of the land of Eanna , who were also $irks, i.e. oblates or

Fempel slaves (Joannes 2000, 40). Another example is B&l-ana-mörehti, slave of a Bel - iddin, who was active in Kig/Hursagkalama during the reign of Xerses (o 10, 174, 177, 179 and 6.). The Nür-Sin/Egibi archive also testifies to (largely) independently acting slaves (see Dandamacy 1984 , 3456, and 6.). 53 Le Roy Laduric 1983 [1969}.

Machine Translated by Google

State archives can only be accessed indirectly . This lack of direct sources obscures the crucial importance of the state for the economic development of Babylonia as a whole.*

In the area of institutional temple economy, state influence is largely responsible for the efforts to increase efficiency and yield in agricultural production , which are behind the institution of general leasing , i.e. the leasing of temple lands en masse to private entrepreneurs . ** It is also clear in other ways that the temples are ultimately subject to royal authority and

that their resources, both human and material, can be used to cover state needs . The private sector also has to bear considerable burdens . The main sources of state income are , on the one hand , direct taxation of the proceeds of dispensaries with a certain status , which have been awarded to conscripts in the hinterland of the cities , and , on the other hand , indirect taxes levied

in connection with various services , port taxes , bridge tolls, fees for administrative officials, notaries and the like . In addition, there are apparently periodic service obligations to which the urban population was also subjected due to their status and membership of a particular social group .

Van Driel estimates by extrapolation based on forms of taxation that are only attested in isolated cases , the relevance of which for Babylonia as a whole is plausible but cannot be proven , that in the Achaemenid period up

to a third of agricultural production was retained by the state . The Achaemenid conquerors essentially adopted existing tax and levy structures , systematized them and certainly expanded them. The integration of Babylonia into a much larger state structure must have strengthened the already existing tendency towards monetizing obligations to the state , for example the replacement of service obligations with silver payments . This necessarily implies the existence of a market through which more than just a marginal part of the

total agricultural production can be sold . The market orientation of

institutional agriculture mentioned above can of course be easily reconciled with this . The buyers will again have been largely institutions or the state ,

but given the quantities handled , they will certainly also have been parts of

the city's population.

The importance of the market explains (at least in part) that prices of the main agricultural goods were systematically recorded as astrologically relevant phenomena over centuries in the so-called astronomical diaries.

55 For the following , see in general especially van Driel 2002, 155ff.

56 ZBvan Dricl 1999,216".

57 The summary in van Driel 2002, 314-322, provides a convenient overview.

58 Van Dricl 2002, 319.

59 The question posed above in note 39 can therefore probably be answered in the affirmative

by this indirect evidence . The conclusions formulated in the previous paragraph are not shared by all specialists : Joann&s 1999, 182, for example , represents the traditional view that market exchange is only a complement to self-sufficiency and redistribution .

Machine Translated by Google

A statistical analysis of this material allows us to identify secondary price trends as well as regular seasonal fluctuations before and after the harvest seasons . Overall, the rates (or prices) are quite volatile. This is an indication of low market integration: local bottlenecks cannot be compensated for quickly and lead to rapid price increases in the short term . From the above , it follows that the role

of silver (or guild) in Babylonia in the first millennium can hardly be underestimated : with the exception of a subsistence economy , particularly in the countryside , which is virtually invisible in the sources but can nevertheless be postulated , monetization took hold - certainly to varying degrees - in all areas of economic life . The amount of silver in circulation must therefore have increased significantly compared to earlier periods . How this silver came to Babylonia can only be determined indirectly . This could include booty or tribute and proceeds from long-distance trade. During the Chaldean period, considerable amounts of money certainly flowed into Babylonia as booty or gifts from the West .

However, this can no longer be assumed for the Achaemenid period, as the Achaemenids withdrew (and hoarded) much more silver from Babylonia . Thus , in this later period , silver could hardly

have come to Babylonia in any other way than through long - distance trade . The texts are largely silent on details, particularly on the Babylonian exports through which this silver must have been earned (see below). One would expect to find textile trade in particular ; the large - scale wool trade of Eanna , which we mentioned above , may have been only the first step in a chain of transactions extending beyond Mesopotamia . The Old Assyrian textile trade, in which Babylonian textiles were sold en masse to Anatolia , could offer a suitable model for this .

Van Dricl assumes that the (increasing) pressure exerted by the state has been offset by general economic growth , which (as stated above)

60 Unfortunately, the vast majority of the documents agaben from the top, from which would that have survived come from the diaries, which are enable the number material

equally few in number and can be put into context .

61 For all this, see most recently, in detail and with further literature, van der Spek and Mandemakers (in press) and Vargyas 2001

62 Coined money is only used in the Achaemenid period ; however , the coins are also

still weighed in Hellenistic times . Vargyas 2001, 24f£. For the justification of the optional translation of Akkadian kaspr silver by money , see e.g. Bongenaar 1999 .

63 S. van Driel 2002, 164f., 318f. Although demand was higher , silver remained in the first millennium even lost purchasing power . Compare the standard price of one shekel of silver (8.3

g) for 300 liters of barley in the first half of the second millennium BC with the frequently quoted standard price of one shekel for 180 liters in the first millennium (although in reality the purchasing power of silver was even lower : prices of two shekels for 180 liters are not uncommon and are still described as average by Vargyas 2001, 130) .

64 On Old Assyrian trade , see for example Dercksen 1999 and 2000 with significant additional literature. should,

Machine Translated by Google

leads) is also evident in the archaeological findings .* Of course, not only are the circumstances of this growth not yet sufficiently understood, the term

itself requires a more precise definition. Mere cumulative growth in production proportional to population growth alone would not be convincing as a compensation for growing tax pressure. Per capita growth would have to be postulated , i.e. increased productivity.® In the crucial agricultural sector, this can actually be proven; the already mentioned concentration on date gardening in the north and the intensification of arable farming in the institutional sector through higher seed quantities per area can be interpreted in this way . Analogous phenomena in other areas of the Babylonian economy have yet to be found . It is questionable, however , whether the increasing

tax burden was actually fully offset by growth ; one of the causes of the uprisings against Xerxes may well be this increased burden on the population , which, according to Müller 's analysis of price data from the late sixth and

early fifth centuries , was accompanied by a deterioration in agricultural yields .

1.7. Summary

Despite all the open questions, one lesson can be drawn from the above summary overview . Structurally , there is a continuity in the period under investigation with earlier phases of Mesopotamian history, insofar as the economic actors known from these times all continued to exist in the first millennium . However , it is clear that market exchange and the associated monetization play an important role and are increasingly penetrating areas where this was not the case in earlier periods , or not to the same extent . This also applies

to core areas of the economy of institutional households. But that does not mean that other economic forms, redistribution and exchange based on reciprocity did not exist : there is clear evidence to the contrary , although the structure of the written documentation fundamentally favors market - based transactions .

One could therefore find arguments here that support a (so-called) modernist view of the Babylonian economy in the first millennium , as well as those that assume the opposite with the so - called primitivists . It is , as Marc Van De Mieroop recently wrote , to recognize that

65 Van Driel 2002, 157,

66 For more on this from a methodological perspective see Salier 2002.

67 Jursa 1995, 6b.

68 Müller 2001, 406£. The problem of documentation from the last years of Darius and the first years of Xerxes, which is closely connected with the presumed economic rise in this period , is now being reopened by C. Waerzeggers . She points out that in the second year of Xerxes, the much-discussed break in the Babylonian literary tradition , mainly central and northern Babylonian archives with reference to the temple cease (typically rentier archives) , while other archives with reference to the royal administration (mainly business archives) continue (Waerzeggers in preparation). The immediate cause for the breakdown of the tradition is certainly political, not economic.

Machine Translated by Google

that fundamentally different economic structures can exist side by side . The relative importance of these structures and of the actors who occupy the respective economic niches is subject to diachronic fluctuations.

It is crucial to try to quantify if one wants to make a statement in this regard.®

Ultimately, the primitivist-modernist dispute within Assyriology, which has been taken over from ancient history , is still relatively young , but nevertheless promises little in the way of new insights . One would be better advised to enter into the related but distinct debate

between formalists and substantivists , as P. Cartledge has suggested for ancient history , and to discuss the form

of social embedding of Babylonian economic forms , be it market exchange

or redistribution or reciprocal exchange . It is of little help to describe the findings of the texts in a positivist manner and to interpret the result using a priori (and therefore unquestioned modern -western) notions of rationality .

In the context of economic sociology, rationality is a variable , not a basic assumption.* The wealth of sources in the Neo-Babylonian period offers the possibility of using a methodology that has many points of contact with the Italian microstoria to at least begin to inductively investigate the motivations

of economic agents , to formulate models and to abstract types using documents and letters from economic practice . The differentiation between rentiers and entrepreneurs presented above is only a first approach that still needs to be refined .

69 Van De Microop 1999, 122. On pages 108-123 he offers considerations from an Assyriological perspective on basic theoretical positions in the study of ancient economics , including the debate between the *Primitivists® and the *Modernists.

70 This of course involves extrapolation from fundamentally incomplete material and is accordingly problematic .

71 Gegen Cohen 2002, 5%

72 Cartledge 2002 {1998], 15: For the formalists, the ancient cconomy was a functionally sog-

regated and independently instituted sphere of activity with its own profit-maximizing, want- satislying logic and rationality, less developed ... than any modern cconomy but ... recog- nizably similar in kind. Substantivists ... hold that the ancient economy was ... socially em- bedded and politicaily overdetermined and so by the standards of neoclassical ceonomics conspicuously conventional, irrational and status-ridden.

73 Vargyas 2001, 285: [T]{ the market exists and everyone is aware of the profit that can be re- atised there, everyone's economic motivation will be altered ... Anyonc who gots a chance will act as dictated by the market conditions, that is, he will produce for the market. The insti- tution of potla& is thus irrclevant in the case of Mesopotamia .., and that is what the adner- ents of the Polänyi school ignorRe.educing the work of the Poldnyi school to the attempt to rediscover potatch (-like transactions) in ancient societies does not do it justice,
74 Smelser and

Swedberg 1994 , 4 til. 1. From an anthropological point of view , see for example Sahlins 1995, 148f. and passim. See also note 45 above .

75 In particular, the larger entrepreneurial archives Egibi, Nür-Sin, Arad-Samag and his father Larsa, Sin-il7 urgently require such a synthetic approach. In the case of the Bgibi

archive , recent works have taken the first steps towards an overall view : Wunsch 1999 and Abraham 2002,

Machine Translated by Google

2. Long-distance

trade q We have already pointed out that long -distance trade must have been

of great economic importance as a supplier of silver . It is all the more

regrettable that the Babylonian sources are sparse , for example when one

compares the wealth of information available from the Old Assyrian period .

There are no merchant archives from our period . The most informative

dossier is that of merchants commissioned by the South Babylonian Eanna

Temple , who were mainly concerned with the import of goods from the Levant

and Syria . But even in the case of the Eanna texts , it is often only about the

purchase of imported goods in Babylon , which was obviously an important trading center . Accordingly, in the context of the general theme of the symposium , it is

problematic to try to extract direct information from the sources on the possible role of long-distance trade as a cultural mediator . ®

The goods that were demonstrably brought to Babylonia by long - distance trade are metals such as copper from Cyprus and iron from Cilicia, alum from Egypt, dyes, mordants and already dyed garments from the Levant, wine and aromatic substances from Syria, timber from Lebanon , and various other aromatics from Arabia and the East . This list is not complete; it only names the best-attested trade goods. Archaeological findings provide evidence of seals, scarabs, glass , etc.° The texts do not report anything explicitly about the goods exported .*' The traders who were commissioned by the Eanna to trade goods in the West received silver in return , not Babylonian trade goods.

If they also carried out export business , the temple gave them freedom to choose the goods .

Some of the Neo-Babylonian professional traders, tamkaru, were specialized in certain types of wares . Date and Shat-tamkdarus are explicitly mentioned ; merchants who were only explicitly committed to long-distance trade do not occur . An important question is that of the status of these merchants: were they

tied to institutions or merchant corporations , or were they free of any affiliation? One often hears , especially in the pre - Akhdmenid period , of royal traders, tamkaru $a $arri; once

76 p. above at note 63.

77 Jonnés 1999, 186ff. We will present some new relevant texts from the Yale Babylonian Collection

as part of the project mentioned in note | 78 Important works on

long-distance trade in the first millennium are Oppenheim 1967 and Joannés 1999. For general

information on Mesopotamia's relations with the West , see e.g. Joannes 1997 and Dalley 1998, 29ff.

79 Long-distance trade goods are discussed in detail by Oppenheim 1967 .

80 Wooley 1962, 60 ('bottle of Phoenician varicgated glass'), 58 and passim (scarab,

scaraboid*); Salje 1995, 43; cf. also Collon 1987, 93. There is no comprehensive study of Western materials from Mesopotamian contexts of the first millennium. I am grateful to H. Baker for relevant information. 81

The archaeological evidence has not been processed, cf. for example Ster 1984, 196f. (Babylonian seals from Palestine).

seems to be a merchant of a governor (§aknu). However, merchants of a temple or god are not explicitly mentioned anywhere. A prosopographical analysis shows that the temple

archives in particular often simply refer to royal merchants as tamkaru , or do not give any designation at all , but only the name . It is therefore conceivable, although not proven, that at least under

the Chaldean rulers tamkarus were basically specialized state merchants , just as was the case in the Neo-Assyrian Empire . Occasional mention of chief merchants (rab tamkaris) proves that there was a hierarchical structure among them , although it is not possible to say anything more precise . In any case , it is certain that, as in earlier periods, especially for the import of "bulk goods" such as wood or metal, either capital concentrations through merchant corporations in whatever form were necessary , given the considerable distances and transport costs , or state or at least institutional support . It is therefore not surprising that, with the exception of the indispensable iron ,

the most frequently mentioned long - distance trade goods are the various plant aromas : prestige goods that are easy to transport and that promise high profit margins ."®

One reads in the literature that the importance of professional traders was comparatively low in the Neo-Babylonian era because they were competed

with private family companies such as the Egibi trading house . In fact ,

numerous private archives also contain partnership agreements, so-called

harränu documents, literally business trip documents. Based on the

terminology , one could assume that these business companies were primarily

intended for long - distance trade . In fact , however , as already mentioned

above, harränu companies can be formed for almost any business purpose ,

although long - distance trade hardly plays a role in the surviving contracts of

this type . Entrepreneurs such as Iddin-Marduk from the Nür - Sin® family or Arad-Samag and his father Itti-Sama§balat from Larsa were (among other

things) wholesalers of natural products, but they restricted themselves to

domestic trade . Finally , the Egibis , who are mentioned again and again ,

also mainly engaged in domestic trade ; however, the largest part of their wealth was pro The trips of family members to Tran , which were seen in the context of long-

distance trade , appear , based on new evidence presented by C. Wunsch and F. Joannés , to be politically motivated goodwill tours to the Achaemenid rulers; the direct commercial benefit that the Egibis derived from these trips was , in contrast, a side effect. The Egibis

84 Radner 1999, 101.

85 CT 55, 173 and 118 , for example, speak implicitly of partnership enterprises

(harränu) of a royal merchant. The latter text is to be added to the dossier

compiled by Dandamacy 1995, 524f , which requires further prosopographical discussion .
86 See the clear remarks regarding the relative importance of mass and prestige long-

distance trade in the 16th century (AD) in Braudel 1995 [1966], [441-3. 87 Dandamaev 1995, S28.

88 . above Anm. 36.

were therefore not primarily long-distance traders (nor bankers , as one occasionally reads) . Finally, the individuals who are mentioned in temple texts as suppliers of long - distance trade goods can rarely be identified more precisely . They do not usually come from the local upper class . Since the temple archives often do not mention the professional title of merchants , there is nothing to prevent the assumption that they were professional zamkärus . In summary , one must therefore state that the urban upper class ,

which has left us mainly the private archives ,

was only very slightly involved in long - distance trade .

Another aspect must be taken into account here : Among the names and patronymics of the merchants, especially those who obviously had something to do with Western trade , an above-average number of non -Babylonian, especially West Semitic names appear . We will give just two examples: the royal chief merchant mentioned in Nebuchadnezzar 's so - called court and state calendar bears the West Semitic, possibly Phoenician name Hanon, and a marriage certificate from Sippar attests to a whole series of royal merchants with Hebrew names who, as a closed group , testify to a contract in which a fellow countryman is the protagonist .* Evidently, long-distance trade was to a considerable extent in the hands of non -Babylonians or at least of descendants of non -Babylonians?4 This agrees well with the observation of Joannés , who pointed out the spiral geographical vocabulary

and the , with a few exceptions , rather undifferentiated view of Transpotamia in Babylonian economic texts.®

In summary: The written evidence from the seventh to third centuries is sufficient to prove regular trade contact between Babylonia and the West, i.e. the Mediterranean region, but it does not allow us to reconstruct Babylonian trade in detail . Nor can we estimate what role tribute and booty played in relation to trade in the Neo - Babylonian Empire . An archaeological analysis of the findings would be an urgent desideratum.® The extent to which trade contacts can be seen as a medium of cultural exchange cannot be reliably assessed from the available sources . The direct involvement of Babylonians in long - distance trade, especially as private entrepreneurs, seems to have been rather low .

91 Regarding the Egibis , see Wunsch 1999, Abrabam 2002; regarding the trips to Iran , see above . frequently Joannés 1999, 185 and Wunsch 2000b, 104"

96 However, this would probably have little effect on answering the crucial question

help to determine in whose hands trade lay above all . In any case , see the ambitious

plan for the second millennium BC offered by Holladay in 2001 .

Machine Translated by Google

With regard to cultural exchange, we would assume that the much better documented exchange of population groups , i.e. from a Mesopotamian perspective the settlement of non - Babylonians in Babylonia , and the mobility of cultural carriers , such as the Lazarites , would have played a greater role than long - distance trade contacts .

Abstract

The paper presents a sutvey of the main economic structures in Babylonia in the first miflennium BC. Archacological evidence points to an unprecedented con- tinuous agricultural, urban and gencrally demographic expansion from about 700 BC onwards. The conditions leading to and sustaining this expansion have to be explored by sifting the textual sources (which are one of the largest corpora of written evidence from the ancient world). There is evident structural continuity compared to carlicr phases of Mcsopotamian history rcgarding the cconomic agents: institutional households (palaces and temples) still play an important role, while the documentation for the private sector is dominated by orban land- owing elites. However, the traditional oikos model is no longer applicable to the institu-fional houscholds due to a shift from an ideally autarchic regime based

on redis-tribution to market-oriented exchange, leading to economic specialisation even in the core arca of the institutional economy, agriculture. In the private sector, an at-templ at describing the prevalent economic mentalitics is made by differentiating two types of economic behaviour: an entrepreneur type engaged

in various com-mercial activities and a more traditional rentier type primarily

exploiting inherited patrimonies, mostly agricultural land and temple prebends. A

higher demand for taxes paid in silver in the Achacmenid period adds to the

effects of cconomic spe-cialisation by increasing the importance of market

exchange and the speed of the monetarisation of economic life. The implications

for the general issue of the na-ture of the Ancient Economy are briefly discussed.

An appendix treats long dis-tance trade as a possible means of cultural

cxchange. This issuc cannot be re-salved definitely due to a lack of explicit pertinent source

Runes : Genealogy and Grammatology

The essay is an augmented version in English of the original Danish essay,
"Runernes Genealogi og Grammatologi" which was presented at Aarhus University 10 October 1996

1. Introduction: Background and Hypothesis

There are more paths into the history of Danish (Nordic-German) languages than that presented by Erik Moltke and his colleagues and companions (WIMMER, SKAUTRUP, N.Å.NIELSEN, MOLTKE, KARKER, KRAUSE, JANKUHN, ODENSTEDT and others). I present a few grammatological arguments for the conjecture that the older 24-sign rune-futhark was established as a well-ordered alphabetic writing system in the same period as the Greek and that both the Runic and the Greek system shared the tradition of the *Semitic writings from the Bronze Age and early Iron Age in the Near East.* [1]

The theoretical basis for my conjectures is a dialectical theory of language which I have developed in co-operation with the philosopher Jørgen Døør (cf. BANG & DØØR 1985-95).

My hypothesis is that the futhark is older than the Greek alphabet. An argument is that there are deeper and more consequential reasons for this being the case than for the opposite.

The hypothesis contradicts the established assumption on the genealogy of the runes which is still passed on in the newest writing encyclopedia *The world's writing systems* (DANIELS & BRIGHT 1996 : 333). The section "The Runic Script" has an explicit reference[2] to Erik Moltke's hypothesis that the runes were invented in Denmark in "the year 0 ± 100 (50) years", and that they "were an independent creation based on Roman writing", i.e. that the runes were invented by an individual "creator of the futhark" and "based on the Roman capital letters of imperial times" (cf. MOLTKE (1976 : 54f.) and MOLTKE (1985 : 64f.) .

There are, however, real contradictions between Moltke's linguistic and grammatological premisses on the one hand and his conclusional hypothesis on the other. If one applies linguistic and grammatological criteria to his premisses and makes a conjunction of his premisses and conclusion the result is a blatant contradiction: His conclusion implies that the runes are younger than the classical Roman alphabet while his premisses imply that the runes are older than the classical, Greek and Roman, alphabets. Thus Moltke writes that the Danes were "always independent of Rome", and he summarises a number of rune- and rune-writing-characteristics in comparison to other writing systems (Phoenician, Greek, Roman and Etruscan) as follows,

(5) The futhark's independence of classical alphabets is shown in its new *sequence of the letters, which is as unaccountable in phonetic terms as the original alphabetical order of the Phoenicians.*

(6) The oldest runic inscriptions have *all the primitive characteristics* observed in the early phase of the classical alphabets (several centuries *before* the runes came into existence): *irregularity of size and line, writing direction both to right and left, bustrophedon*, inconsistent or non-existent punctuation, and the fact that *each rune has its individual name*.

MOLTKE 1985:65 [My italics, JCB] [3]

So, Moltke acknowledges that the ordering of the futhark, the "alphabetical order", opposes the order of the classical alphabets, just as the Phoenician on which Greek is based; the runic inscriptions have all the (more) primitive characteristics which are known from pre-classical writings, including individual sign size, alternating left- or right-directional writing, and every rune had a name with a meaning.

It seems to me less probable that one by chance should develop signs and a writing system that in analogical ways share both sign form and orders, names and phonetic values, and forms of writing, with much earlier writings without knowing these writings or sharing their grammatology. The Roman writing system implies a grammatology characterized by more abstract, metaphorical, or "quasi-non-analogical", relations between the graphic, phonetic, and semantic dimensions of the sign, while the pre-classical writings more explicitly indicated the analogical implications of the dimensions and media.

On the names of the signs DANIELS & BRIGHT (1996 : 261) notice that "these names have meanings only in Phoenician (or Semitic in general), not in Greek (or Indo-European)". The analogy relation between the sign's form and its meaning was forgotten – abstracted or absent from conceptual memory – following the formation of the Greek alphabet.[4]

The Viking Age runes did, however, have names that have meanings in Old Norse and also from Gothic and Anglo-Saxon we know rune-names with a meaning. W.KRAUSE and others have tried to reconstruct the old futhark-runes' original names and plausible meanings. In my argumentation I use these younger and reconstructed names and meanings to indicate that the old futhark-runes explicitly were associated both with the phonetics and the semantics of the prototypical name. Today we cannot but make conjectures on the original names and their phonetical and semantical implications. It would be, however, interesting if the runic signs in more relevant aspects shared phonetic and semantic fields with graphically similar signs of one or more pre-classical writings. I think there are more linguistic and grammatological indications for that. This should imply that the runes were created (by creative transformation) in a time and place by people for whom these interrelations were present, i.e. before the Greek loss of the pre-classical form-name-meaning-relations. And long before the name-less letters of the Roman alphabet. The runes have recognizable roots in pre-classical tradition and are a potential source to older stages of Indo-European languages.

(And furthermore to the younger stages, e.g. to the Greek and the Roman writing systems and the modern European languages).

Therefore, I think that Moltke is wrong in his insistence on the time, place, and model of origin of the runes. Thereby, I certainly – implicitly – question those archaeological identifications which Moltke used as his *a priori* determinations.[5] However, my arguments are in accordance with now accessible, and comparable, grammatologies and data, e.g. the outstanding *The worlds writing systems* (DANIELS & BRIGHT 1996) and MORRIS 1988. I hope hereby to contribute to explanations and assumptions which to a lesser degree are determined by linguistic and grammatological contradictions or ignorance.[6]

The Moltke tradition obviously faces grammatological problems when defining several of the runes as derivatives of Latin capitals. Moltke writes, e.g.

> We have no way of knowing why the futhark's creator used Latin P for his *w* [ᚹ] and then designed the more complex character ᛈ for *p*. […[7]] Nor shall we ever understand why he used the form of Roman M for runic *e* [ᛖ] but modified it slightly to create his runic *m* [ᛗ]. Similarity of form and sound show that the m-rune must have been inspired by Roman M. Was it because he had already fixed on M for *e* and was reluctant to go back on his decision?

MOLTKE 1985: 66 [My parentheses, JCB]

These and other problems can be solved less "complicatedly" (one of Moltke's criteria) by understanding the runes as formed in a Semitic-Arabic writing tradition; here the already mentioned signs, and others, can be found in analogous *forms* with similar *phonetic-semantic* characteristics; and with corresponding writing habits, alternating writing directions and *bustrophedon* ("furrow-writing").

In the following I shall attempt to show some remarkably clear *analogies in form, sound, and meaning* between the runes and documented (attested) writings prior to the Greek alphabet, more precisely from the Bronze Age and early Iron Age, localised to the cultural area between the Nile and the Tigris. By doing this we more easily can explane the concrete characteristics of the runes. And perhaps we better can understand the Indo-European phenomenon (cf. the observation by Rask, Grimm, and Verner that the current Nordic (-Germanic) languages have certain systematic correspondences with the current Roman (-Greek) languages). The Indo-European phenomenon indicates that the Indo-European languages were born out of a common, or shared, culture. Through the years, owing to mutual cultural separation, the different people developed different phonologies, to different degrees conservated & transformed by traditional writing-articulations and/or by later imported forms of writing. The runes could be a *hereditary* writing form accompanying "the Danish tongue" along the same paths to Denmark; perhaps around the Black Sea and north along the Russian rivers. (Cf. e.g. OTTO VON FRIESEN 1904). If so, it was not until the introduction of Christianity (c. 1000 AD) that we *borrowed* a writing form, Latin, which can be seen as a kind of nephew or niece in relation to Runic writing.

My hypothesis regarding the genealogy of the futhark has vital implications for our understanding of the Nordic and (Indo-) European languages and cultural identities; it follows amongst others that the Greek alphabet *is not* alone as the world's first fully alphabetical writing system in the development from *pictogrammes*, *(logo-) syllabaries* and *consonantal* writings ("*abjads*"). Furthermore, my arguments and data illustrate the effect of the assumption that no language sign or symbol in any important or interesting way is arbitrary (but analogy-motivated in several dimensions and relations in order to work, refer, recall, relate: mimesis, mind and memory).

Moltke (and the Moltke tradition) considers the runes to be an invention made by an individual rune-creator in a given place (Denmark) at a given time (approx. year 0). This rune-creator supposedly had knowledge about a fully developed classical alphabet, the Latin alphabet, from which *he* borrows in order to construct a complete runic alphabet. Then he implements this writing so skillfully in an illiterate culture that this culture, during the next thousand years, uses this writing form homogenously (however with a revision ca. 750, when the 24-sign futhark was replaced by the younger 16-sign futhark). I find it improbable that a

single revolutionary can revolutionize such a large cultural area *without* there being any tradition-based foundation for this in the culture.

The development of *applicable* and *learnable* alphabets is, however, a large-scale, human achievement, which has taken humanity many generations to develop. (Just as in this day and age a great deal of resources are – more or less sensibly – directed at upholding a writing norm and teaching each new generation the writing and reading of the norm.)

I am rather inclined to assume that a complete writing system, such as the old Futhark really is, should rather be considered a *classical* writing system, with its adequate phonological and morphological relationship with the spoken language, with its vowel and consonant signs, with its restricted inventory (24 signs), and so on. Where Moltke considers the until now earliest dated findings from around year 100-200 AD as the beginning of the Runic era, I consider these findings as being at a classical, fully-matured stage at the end of a development over generations of forerunners. Therefore I would rather ask the question:

Where can we find this mature writing's earlier forms, the forerunners of the classical Runic alphabet?

The same question has been asked and answered about the acknowledged classical writings, Latin and Greek. Today grammatologists acknowledge these writings as a comprehensively conditioned, cultural and institutionalized norm, which has found its classical form being the product of the general cultural tradition and development; a cultural writing tradition and development over a period of several thousand years; ranging from the first Egyptian dynasties, through the Near-East's ("Semitic and Arabic") thriving cultural environments in the Bronze Age, over one of these (writing) dialects (the "Phoenician"). The Phoenicians were especially connected to the new cultural form of trade (implying money, coins) in the Eastern Mediterranean region, the Western Near-East, where Greek culture was provided the sufficient conditions for flourishing and established the classical Greek alphabet.

Just as in the Moltke tradition, I see clear kinship-*similarities* between the Runes and Greek and Latin; but I see clear *generation* differences, which tells me that the mature futhark comes from a different line of descent, and that its traditional forerunners should be sought in older generations of writing and culture than the immediate forerunner of Greek, i.e. in those environments which were prior to, or were found in other places than the Phoenecian writing norm's dominance.

The finding of runes from before the Greek alphabet?

I am greatly endebted to my now deceased friend Kai H. Sørensen, typographer & cand.phil., for actually finding rune-like signs, i.e. figures of writing which in architecture and line very much resemble runes. Kai H. Sørensen joined for many years my courses on language history where I, amongst other things, sought better explanations than the generally assumed

regarding the genesis of the runes; and I joined his studies of typography and handwriting; and so, one day a couple of years ago he placed the table in front of me which can be found in Appendix 2 (DRIVER 1976 : 145). We looked and drew and compared and blinked hard: There were really many striking similarities between the runes and the South-Semitic-Arabic "Thâmudean" signs.

Afterwards I studied several contemporary writing dialects from the same area with the forms and names of the signs in mind. I began to consider the names to be a source to both the phonetic values of the signs and their proto-meanings, i.e. their phonetic-semantic references as signs. Moreover, I began to see the deictic indications of the signs as gestured proto-meanings such as 'ox/cattle', 'house', 'door', 'stem', 'sign', 'eye', etc. I could trace a chain of transforming transmission to the newer, more stereotypicalized, forms of the signs, from the older, more proto-iconic, forms that more directly were formed to symbolize by means of transparent analogies between the graphic form and some salient visible characteristics of the proto-referent, e.g. the two horns of the oxe, the roof and walls of the house, the triangle form of the door, the waves of flowing water, the parts of our human body, eye, mouth, hand, etc. By saying, and listening to, the sign-names and learning their meanings, i.e. their phonetic and semantic implications, I began to glimpse developmental conditions and potentials in the vital grammatological dialectics of the sign in writing, sound, thought & reference, as well as the internal, traditionally bound dependences (their "synchronic and diachronic" conditions).

When my friend Jørgen Døør, the philosopher, drew my attention to the new encyclopedia of writing systems (DANIELS & BRIGHT (1996)), I found here a presumably competent, full and comparable presentation of the signs of identified writings. I found signs looking exactly like runes in the tables of Semitic-Arabic writing signs from the Bronze Age and onwards. In Appendix 4 I supply these tables as very important evidence and documentation of my hypothesis that in this area, in this age, we find the probable forerunners of the runes. I do not identify a single writing dialect or a more precisely specified area as being the precise environment of the runes, for the good reason that I do not know enough about this, but I suggest the existence of a large, coherent environment where characteristics of the runes, in several relevant details and aspects, were very much present.

2. Analogies between the Runes and the Semitic-Arabic writings from approximately 2000-1000 BC.

In this section I show some analogies between runes and pre-Greek characters, more precisely signs in Arabic-Semitic writing dialects which are

- clearly and recognizably related (belonging to the same literate milieu),
- clear and recognizable developments of Egyptian hieroglyphic script,

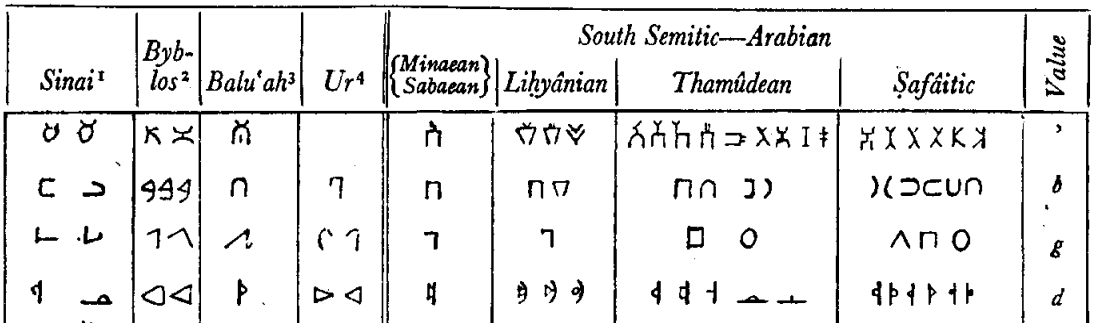
- clear and recognizable precursors, or forerunners, of Greek characters (which are in turn models for the Latin ones).

Here I shall deal with only a few runes and compare them to only a few tables of script and writing.

2.1. Possible forerunners of the first three runes [ᚠ ᚢ ᚦ] (f, u, and th)

Let us begin with the first three runes of the futhark and compare them with the first signs in the traditional order of Semitic-Arabic writings. I refer to Fig. 3a and to the tables of Appendix 2-4. In all the tables of App. 4 the signs are listed according to "the traditional order", so we can easily, line by line, follow and compare the graphic presentations in the different dialects of the signs of "the same order". Furthermore the tables indicate – more or less explicitly – the phonetic and semantic "values" of the graphemes.

Fig. 3a: "Sinaitic and South-Semitic signs" (Driver 1962)



The first rune, the f-rune [ᚠ]

Moltke, and others, identify the first rune, the f-rune [ᚠ], as derived from the Latin F. Of course there are obvious similarities between ᚠ and **F** both in their visible graphic form and in what we today assume was their contemporary phonetic "value".

But why was the f-rune placed as the first sign of the futhark and why did it have a name with a meaning and why that name and that meaning, or semantics?

By comparing the f-rune with the above-mentioned writings – the forerunners of "fully alphabetical writings" – I see graphical analogies to the ALFA-ALEF sign, the first sign in the traditional order.

Semantically, the sign-name ALEF-ALEPH-ALFA had the lexical meaning 'ox' and this meaning can be indicated by the two staves in the graphic form if these are interpreted as analogical symbols of the two horns of the ox, or *fæ*, *Vieh* ('cattle'), a well-known *pars-pro-*

toto symbolics. The meaning of the first sign of the futhark is probably FÆ 'cattle', the runic word for the general equivalent value, 'wealth', cf. Latin *pecus* and the modern Danish loan-word *pekuniær* (pecuniary), *penge* (money). FÆ, 'cattle', is a more general category than the specific ox, but both are sharing similar semantic fields. The difference could be explained by cultural development.

Phonetically the proto-word *alef-alfa* contains both a- and f-phonetics, so that both a- and f-phonemes are possible developments from, compatible with, or constituents of, the sound-situation of the same proto-word. Perhaps FÆ was developed from AL'FÆ with the removal of the first syllable that perhaps was unstressed and considered as being a prefixal morpheme *al-*.

Both the Greek ALPHA and the futhark's FÆ are possible developments of the same earlier forms and unities; in Appendix 4 we can see, at the first order place, both clear [ᚠ] forms (e.g. 4 B, col. vi and viii, and 4 D, xxi, xxiii) and clear [α] forms (e.g. 4 B, x, 4 D, xxv) as well as forms potentially implying both.

The fourth rune of the futhark [ᚨ], a, has perhaps been developed from the same ALEF-ALFA sign in order to indicate the vowel-part of the syllable- or word-sound as the f-rune indicated the consonantal part. The f-rune was placed at the first order place probably because the fæ-sign had the corresponding semantic value, meaning, of that place. The a-rune can additionally be interpreted as being a vowel indication of the l-sign [ᛚ] "lameth", 'a goad' (cf. Apps. 2B and 3). All the signs related to words, or syllables, including salient "a-phonetics", such as AL, FA and LA, are in a phonetic aspect motivated to function as a prototype model for the modification into an a-vowel-sign; which of them was the dominant model I cannot decide without further study. As both the f-rune and the l-rune share relational indications with the a-rune it is possible that the a-rune was created to indicate "the common denominator" of AL, FA and LA, cf. the phonological method of commutation.

The first place in the futhark indicates the interpretation of the f-rune [ᚠ] as being an eqvivalent and analogue to the traditional first sign; therefore there might be an analogical correspondence to the Greek alpha [α], and later the Latin *A,* which until now has been out of sight.

If the f-rune, as assumed by Moltke, was created on the basis of the Roman F, there were no obvious reasons for its place in the futhark and for its name and semantics.

My interpretation implies an explanation of the fact that the f-rune is the first in the futhark and that it had that name-semantics and value. The graphic form of the f-rune is more similar to some of the forerunner signs than it is to the Latin or Roman F. The phonetic value of the f-rune is compatible with the phonetics of the name of the forerunner sign ALFA-ALEF.

My conjecture is that the f-rune depended upon the forerunner sign ALFA-ALEF and was completely independent of the Roman-Latin F.

The second rune of the futhark order, the u-rune [ᚢ]

The second rune of the futhark order, the u-rune [ᚢ], displays similar analogies to the second sign in the traditional pre-classical writing systems, both in order, graphic form, phonetic and semantic field.

Following Moltke and others the graphic form of the u-rune was an upside-down Latin V and its name was *uruz the meaning of which was 'aurochs' *('ur-okse')*.

If, however, we compare the graphic form [ᚢ] with the second sign in pre-classical writings we find several examples of a similar form (cf. e.g. Sinai, Balu'ah, Ur, South Semitic-Arabian (Fig. 3a and Appendix 4). In Appendix 2B and 3 we can see a hieroglyph of similar graphic constitution.

The meaning of these signs belongs to the semantic field of 'house' with a name phonetically similar to *BETH* (a Hebrew word for 'house').

It is probable that the graphic form was *coined* as a symbol that indicated the walls and roof of a house by means of analogy.

The cultural-semantic value of 'house', 'home', 'origin' could imply reasons for the prominent second place in the sign order, next to the sign for the exchange value, ALEF-ALFA.

It is the current assumption that these beth, or house, signs (via the Phoenician script) were the forerunners of the Greek BETA (cf. e.g. DANIELS & BRIGHT 1996 : 261 ff.). The Greek BETA [β] has a name that shares the phonetics of BETH (but, as mentioned above, the Greeks forgot its original meaning, its *ur-* or proto-meaning 'house').

Now, the u-rune obviously shares the number in the sign order, and the graphic constituents of the old 'house' signs; but did the u-rune, in any significant aspect, share the phonetics and semantics with those signs?

Phonologically the u-rune [ᚢ] denotes a vowel as the Greek beta [β] denotes a consonant. Phonetically, however, they share the rounded bilabial articulation behind which the cave, or house, of the mouth, the oral cavity, is sounding. The phonetic similarities between the two sounds are implied by some word-relations such as *bio-vita-liv-live.*

Semantically, the u-rune could share fields of meaning if its probable name *uruz could be interpreted 'ur-hus' ('proto-house'), 'ur-os', 'ur-mund' ('proto-mouth'). Such an interpretation is in accordance with the assumed etymology of the Danish city name *Århus* that probably originates from AR-OS with the meaning *'å-munding'* ('river mouth'). Both UR- and -US can be interpreted as semantically related with BETH in meanings such as 'house', 'origin', 'home', 'cave', 'mouth', 'uterus'. In the grammatological context these interpretations are more pertinent than the current "aurochs" that lacks any obvious relationship.

Following my explanation the u-rune shares much genealogy and grammatology with the Greek beta and the Latin B: common forerunners of similar graphic forms, sign order, semantic values, and phonetic features. In spite of the obvious surface graphic and phonetic

similarities between rune-b [ᛒ] and Greek [β] and Latin B, I think that their differences (sign order number and semantics) indicate that the b-rune was more secondarily related with the forerunners of beta and B than was the u-rune. Of course there might be some system-internal partnership of the b-rune and the u-rune, cf. the interesting meeting of B and U in the important words *bo, bonde, by* (residence/live, farmer, town), and URBS, ORBIS. (Further comments on the b-rune in section 2.2). I want to emphasize that every sign has more than one motive, or cause, more than one history, and hence different explanations may be true.

My conjecture is that the u-rune [ᚢ] depended upon the forerunner sign BETH and was completely independent of the Roman-Latin V.

The third rune [ᚦ] the th-rune

The third rune [ᚦ] the th-rune holds clear analogies to the fourth traditional sign, the "daleth-" or the door-/thor-sign. The ᛑ-rune corresponds to the Greek delta [Δ δ] and the Latin D, in other words the fourth sign in these alphabets.

Moltke interpreted the ᛑ-rune as "direct loan or close imitation of Roman D" because of "similarity in both form and sound" (MOLTKE 1985 : 59). Again, the similarity in form and sound between Latin D and the ᛑ-rune are obvious, but their deeper relationship disappears in Moltke's comparison as his methods do not imply criteria for telling which of them is the older and which the younger.

In the tables of the pre-classical writings (cf. Fig.3a and App. 2-4) we find several "daleth" signs of graphic forms that much more than the Roman D are similar to those of the ᛑ-rune (the triangle upon the middle part of the stem). And we find "daleth" signs of a form more similar to the delta triangle of the Greek delta and the Roman D.

Phonetically, the names "daleth" and "delta" may imply phonetic features similar to our modern d-, t-, and th-distinctions. If the futhark rune [ᚦ] indicated th-phonetics and two different signs, [ᛞ or ᛞ] and [ᛏ], indicated d- and t-phonetics – and this is the current assumption – then I find it more probable that the th-rune was coined in the environment of "daleth" than in that of "delta" and D. If the runes were created on the basis of the Roman capitals, why was it not the d-rune, but the th-rune, that most directly or closely imitated the Roman D? (The Latin word for 'door' was *foris*; the futhark is obviously closer to the proto-Indo-European form *dh than are both Greek and Latin; it is misleading to conceive the Indo-European developmental processes as if the Germanic languages (sound and script) are more transformed in relation to "Proto-Indo-European" than are the Roman ones).

Following Moltke and others the reconstructed name of the th- rune, *thurisaz, means 'giant'. Why should the *third* rune imply such semantics? How could 'giant' function as the prominent prototype for the third rune?

Again, I think we may find better conjectures on the th-rune's name and semantics if we consider the semantic fields of the pre-classical names of the similar signs, i.e. the semantic

fields of ‘door’, ‘gate’, ‘port’, ‘gateway’, ‘Thor’, ‘Tor’, ‘dør’, ‘opening in house towards the outside world’. The th-rune could imply the semantic value of the door, next to the u-rune’s of the house and the f-rune’s of the wealth. Why not suggest that the prototypical name *thuri- meant ‘door’, ‘thor’? A simple referent was the door or port in the everyday life which truly opened for more metaphoric meanings and usages. Both the Danish *dør*, the English *door*, and the German *Tor* may be phono-historical developments from a name like *thuri-.

My conjecture is that the th-rune [ᚦ] shared semantics with the old door-sign as did the later delta- and d-signs. Cf. as important examples the numeral *three* and the second and third person pronoun, which were indicated by the ᚦ-sign, ᚦᛁᚲ, ᚦᛖᛁᚱ, *dig, dem, Dich, Thou, them, their*.

(The d-rune [ᛞ] or [ᛗ] can probably be understood as a double sign, namely two daleth-/th-sign put together, and the d-rune may be part of a different phono-semantics than the th-rune. The d-rune is most likely younger and especially connected to the “do-” morphology, i.e. the younger past tense conjugation of verbs, cf. the placing of d and o [ᛞ ᛟ] as the two final signs in the futhark order next to the ng-rune [ᛜ] implied in the derivational suffix -*ing*).

Following this interpretation the beginning of the futhark can be understood as motivated by the common tradition, and so the name *futh-ark* can be viewed as analogous with *alfabet* and *abecedarium* in more dimensions. (Perhaps *-arc* was related to semantic fields like ‘order’, ‘traditional order’, ‘system order’, cf. the meaning in words like *hier-archy, olig-archy*, or *Noah’s Arc,* or *archaic*).

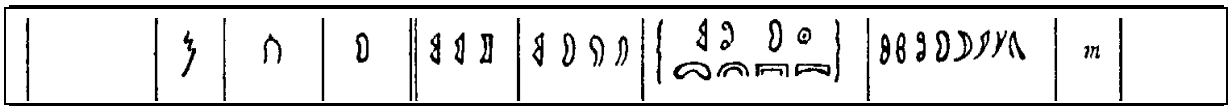
Why the traditional third sign, GIMEL-GAMMA-’camel’, did not get that place and the implied values in the futhark, is a relevant question. Perhaps the form and values of the GIMEL-GAMMA sign was not general in the relevant area and time but a more local, or later, creation, cf. that the “g-place” in several of the scripts (App.4) has a sign similar to the u-rune [ᚢ] if the script has a more beta-like form at the “b-place”; cf., too, that the Greek and Roman alphabets have different forms and values at that place. Perhaps a camel was neither a prominent part of the Runic people’s everyday life nor prototypically associated with the sixth rune [ᚲ], currently transliterated k. The sixth rune, the c-rune, could perhaps relate to the old ‘throw-stick’ sign and/or the analogical hand gesture. I think that the so-called k-, g- and h-runes should be subject for closer studies along the lines similar to those proposed in this essay; perhaps we might gain a deeper insight in their phonetic and phonological transformations during the history of Indo-European languages).

2.2. Possible forerunners of the runes No 18-20 [ᛒ ᛖ ᛗ] (b, e, and m)

At the “mem” line, m, in the possible forerunner writings (see appendices and Fig. 2b) we find clear analogies in form of each of the runes [ᛒ ᛖ ᛗ] (b, e, and m). The old

hieroglyphic sign was analogous to the waves in the water, 'the source of life', and a Semitic name for this sign was MEM.

Fig. 3b: A part of the "mem" line of the "Sinaitic and South-Semitic signs" **(Driver 1962)**



Phonetically, "*mem"* implies both m and e. A proto-sign with that name could be used as a common relative for both the m-phoneme and the e-phoneme when coining different signs for the vowel- and consonant-aspect of the formerly entity.

Both e and m are important "mini-morphological", phono-morpho-semantical, constituents in the Indo-European *first person singular prounouns* ; the nominative case is dominated by e (*ek, ego, ich, jeg, I*), while the other cases are dominated by m (*me, mik, mig, mich*). The first person pronoun is the deictic expression for the speaker of an utterance and is as such a basic constituent in speech referring to the person who utters the signs. It could be a possible semantic (metaphoric) development from water as 'the source of life' to humankind as 'the source of speech (and writing)'. It is in agreement with such a cultural semantic development that the m-rune was related to the name *mann- 'menneske' (man, person). (The words for 'mother' are wellknown as indices for the more general phono-semantic implications of the m-phonetics, cf. e.g. ROMAN JAKOBSON (1979) and BANG (1987) and (1995)).

It is also phonetically well-motivated if the b-rune [ᛒ] relates to the same protosign: the Nordic-Germanic b and m share some phonetic constituents, "segments", or features: closed-lips and non-aspirated opening, cf. the tendency to loss of b-distinctness when articulating words implying b and m in juxtaposition such as *købmand* ('tradesman') or *lambs, climbs.*

It is worth noticing that the three runes, which I interpret to be developed from one and the same traditional sign, MEM, are placed next to each other in the futhark, flanked by the traditional signs t and l (the "sign" and the "stem") [ᛏ ᛒ ᛘ ᛗ ᛚ]. In the syntax of the futhark they are closely related; should this constellation indicate some genetical and semantical relations? And should the primitive deixis sign, "the pointing arrow" [ᛏ], indicate some key function of the following signs as being the more transparant examples of the logics used to create the futhark *system*?

This interpretation implies that the b-rune has a different history than the Greek beta and the Latin B. There is supposedly both a phonetic and semantic difference between the Greek-

Roman b and the Nordic-Germanic b, even though we today see and perceive the Latin letter B to be "identical" to the Nordic. The graphic similarity between the b-rune and the Latin B has, in connection with the forgetting of the meaning of the signs, led to a confusion, and ignorance, of sources, which of course cannot be helped by a linguistics that is systematically bound to a paradigm based upon the *apriori* assumption that the linguistic sign is arbitrary and without relevant historical and contextual relations. But I think it may be of interest whether or not our u is related to the Greek beta and whether our B is related to our (and the Greek) M.

I understand that Moltke has found it difficult to understand the graphic similarity between the m-rune and the e-rune, seen from a Roman, or Latin point of view, but with the older writings as forerunners the similarity is motivated.

(Let me, too, suggest a meaning of the so-called w-rune [ᚹ], rune No 8, which Moltke could not understand. Graphically it looks like a Latin P but they share no other obvious characteristics. If we try to consider the "qof" sign to be the forerunner of the w-rune, however, we can find some interesting similarities. This sign's name implies both the qv- and the hw/wh-phonetics and can then be understood, also morphologically, to be a forerunner of both the Roman and the Nordic-Germanic question-morpheme prefix. If we should compare Runic and Latin signs there were perhaps more relevant shared relations of the Latin q/Q and the Runic [ᚹ]).

3. The runic figures as mutually distinct writing-articulations corresponding to phonetic-semantic prominent distinctive features.

In previous sections I showed some possible 'lexical' backgrounds for the runes, i.e. the runes' dependence on a similar sign's traditional phonetic-semantic implications, what these signs hitherto meant. Now I take a different view by viewing the mutual indications of similarities and differences between the runes, i.e. their mutual systematic formation, their 'anaphoric' relationship. Here, I shall also present just a few examples. Firstly a few examples which show some possible consonant correspondences, and secondly, some possible vowel-consonant correspondences.

If I am correct in my reference to the mentioned writings as the forerunners of the runes, the construction of the runic alphabet met two writing-historical tasks: one was to extract vowel signs from the "consonant" signs of the age; the other was to relate the phonetic qualities of the signs to prominent graphic expressions, i.e. to make the written signs more phonetically-phonologically indicative and less iconically-semantically bound. The same tasks which were carried out in the formation of the Greek alphabet and even more perfected

– into phonologically abstractness (as if without bodily and other meanings) – in the Latin alphabet.

Consonant system correspondences

Above was mentioned the "lexical" and phonetic relationship between the m-rune and the b-rune. Taking the b-rune [ᛒ] as my point of departure I shall view some possible correspondences between the graphic and phonetic expression and articulation.

Now I consider the b-rune to be constructed from segments which form a stylized figure of two closed lips. Following the same segmental logic I see the same two lips indicated in the p-rune [ᛈ], but with the distinct difference that now the lips are parted. (Michael Barnes has previously made the same observation, cf. Note 7).

Fig. 4: The Consonant Groups b, w/v, d, g, p, f, t, k

Prominent features	translit.	non-aspirated	aspirated
bi-labial (two lips)	b : p	ᛒ	ᛈ
mono-labial (lip-teeth)	w/v : f	ᚹ	ᚠ
tip tongue-teeth	d : th : t	ᛞ ᚦ	ᛏ
back tongue	g : k	ᚷ	ᚲ

If I then continue to compare, based on the same segmental logic, the b-rune and the w-rune, i.e. [ᛒ] and [ᚹ], the first one can be considered bi-labial, while the other misses one of the lips which corresponds to the monolabial (labiodental) w or v. I then move on to the aspirated opponent to v/w, f, which agrees with the same segmental logic: [ᚹ] [ᚠ] . If I continue inwards, against the air-flow used to express the sounds, I move from labial to frontal-dental consonants. When I then look from w to th [ᚹ] : [ᚦ], I see that the place of closing-opening has been lowered on the stem (inwards corresponds to downwards), while in the relationship between th and t [ᚦ] : [ᛏ] I see the closed room of the triangle (more "voice-body") as opposed to the open, aspirated, segment (minor "voice-body", more "air-flow-sound"). As already mentioned I view the d-rune as a morphologically dependent new formation (in relation to the time of establishment of the futhark). The grammatological history of the three consonants, t, th og d, requires further treatment, which I will not discuss here. In Fig.4 I have tentatively shown some features of the consonant system where phonetically prominent, or salient, features are corresponded by graphic, segmental indications.

Consonant-Vowel analogy-correspondences

It is well-known that the forerunner-writings did not (and do not) contain any real vowel signs. The indication of vowel signs in the Nordic-Germanic dialects were, however,

important due to their verbal inflections (cf. e.g. *synger, sang, sunget*, *sing, sang, sung*). Much indicates that the vowel signs were constructed from the proto-names of the "consonant" signs, as mentioned above in connection with common origin of the e- and m-runes. In Fig. 5 I show some possible and motivated vowel-consonant pairs, which, due to space, will not be further commented upon, but left open to closer observation and reflection.

Fig. 5: Vowel-Consonant-Analogies

	vowels	consonants		vowels	consonants
a : f / l	ᚨ	ᚠᚢᛚ	i : n	ᛁ	ᚾ
u : b	ᚢ	ᛒ	o : ng	ᛟ	ᛜ
e : m	ᛖ	ᛗ	ë : j	ᛇ	ᛃ

Fig. 6: Runes-Greek-Latin-Analogies

Name and 'meaning'	Runes	Greek	Latin
'fæ', 'Vieh', 'cattle', 'value' *fehu, alef / al-fa*	ᚠ	α	A
'house', 'hus', 'ur-mund', *ur-uz, bu, beth*	ᚢ	β	B

4. Summary and conclusion

To summarize:

The **graphic** forms of the runes, their **names** (implying **semantics** and **phonetics**), their mutual **system**-correspondences (implying **phonetics** and vowel-consonant **phonology**), and

their **place** in the order of the old futhark (implying cultural **value** logics), indicate that the runes are closely and directly related with the preclassical scripts (being shared prototypes) dated before the (differently stereotypicalized) classical Greek alphabet. The runes share in several aspects the characterics of the more primitive, preclassical, scripts. Their shared grammatology indicates their genealogical relations; and by means of that kind (kinship) of grammatology it is possible to explain the characteristics which hitherto were considered as being incomprehensible, e.g. the futhark order, the p-, w-, m-, and e-runes. By means of the more adequate grammatology of the preclassical scripts and signs, it is furthermore possible to formulate more interesting and 'deeper' interpretations of the signs and the characteristics which the futhark shares with the Roman alphabet and "capital letters of Imperial times". To consider the classical alphabets as models for the study of the runes is to use a simpler and more reduced system as a matrix ("mother") for a more complex and multidimensional system. By using a modern grammatology in the study of the runes, Moltke, and his colleagues, were not aware of the characteristics which are not ac*count*ed for in the modern grammatology and theory of signs. By trying to be aware of a more contemporary grammatology – at least to be more open to the possibility of a grammatology different from the modern type – I think we are able to learn deeper insights in our common origins and perhaps better to know our modern constitutionals and relations.

Notes

Note 1
"The Semitic languages are spoken across major sections of the Old World […] In ancient times they were spoken in the area of south-western Asia known nowadays as the *Near East or the Middle East, from the banks of the Tigris in the east to the Mediterranean in the west, and from the Armenian mountains in the north to the Arabian peninsula in the south*; then, as now, they were used alongside a variety of languages from other families." [My italics, JCB]
DANIELS & BRIGHT 1996 : 88

Note 2
"The runic futhark, so named from the first six symbols […] in the traditional common Germanic sequence of its letters, is *of uncertain origin*. It *may* have been *the creation of an individual familiar both with the Roman alphabet*, as there are many formal parallels, and with some northern Italic alphabet or alphabets which share some more unusual runic forms as well as the variable directions of writing found in some runic inscriptions, but not in Latin. *That the futhark was invented in Denmark has been argued strongly by Moltke* (1985: 64-65).
The earliest runic inscriptions from Denmark and Schleswig-Holstein are all on portable objects dating from the first century C.E. Others, also using the common Germanic futhark, belong to the period of the Germanic migrations and have been found in various parts of central Europe. Despite some minor formal variations, *they all show remarkable uniformity of lettering and variable direction of writing*. Their language has been called "Runic" or, better, "Northwest Germanic." [My italics, JCB]
DANIELS & BRIGHT 1996 : 333

Note 3

"Let us conclude our survey by summarising:

(1) The presence of two i-runes shows that the futhark was created not later than the end of the second century AD (This idea is now obsolete, as the ï-rune originally stood for c4).

(2) The oldest known runic inscriptions (Øvre Stabu, Illerup) are dated on archaeological evidence to c. AD 200, but if the inscription on the Meldorf fibula is runic – and of course it is – then the date of our earliest inscription has to be moved back by another 150 years, to c. AD 50. If we follow cautious practice in alphabet history and allow one or two centuries of as yet undiscovered finds to precede the oldest known inscriptions, we arrive at a date around the birth of Christ, or perhaps as far back as 100-150 BC, for the origin of runes. It might seem safe to say the year 0± 100 (50) years.

(3) For chronological reasons the runes cannot stem from the Phoenician alphabet, and for reasons of letter-shape they cannot be derived from the Greek alphabet (particularly not Greek cursive). Derivation from Etruscan is ruled out by letter-shapes and by principles of alphabet history (cf. also point (7) below).

(4) Runes are based on the Roman capital letters of imperial times. Some ten were taken over directly, others were imitated, and some completely new signs were invented.

(5) The futhark's independence of classical alphabets is shown in its new sequence of the letters, which is as unaccountable in phonetic terms as the original alphabetical order of the Phoenicians.

(6) The oldest runic inscriptions have all the primitive characteristics observed in the early phase of the classical alphabets (several centuries before the runes came into existence): irregularity of size and line, writing direction both to right and left, bustrophedon, inconsistent or non-existent punctuation, and the fact that each rune has its individual name. [The younger futhark inscriptions have the same characteristics, cf. e.g. Glavendrup, JCB]

(7) Points (4)–(6) lead to the conclusion that the futhark could not have arisen in the immediate vicinity of the classical alphabets.

(8) Judging from an abundance of early inscriptions in a relatively confined area, Denmark is the most likely place for the invention of runes. They were an independent creation based on Roman writing. The inspiration could have come from the Rhineland."

MOLTKE 1985: 64-65

Note 4

"Semitic consonantal writing, as developed and attested in the North Semitic scripts, was the ancestor of three geographically and linguistically diversified developments: […] and the third spreading toward the west, where it led to the creation of fully alphabetic writing systems for the Indo-European languages.

[…] of the Phoenician consonantal script (22 signs) to the Greeks […]

The derivation of the Greek alphabet from the Phoenician script is evident from: [a] the shapes of the letters, obvious despite reflection, elaboration, or simplification; [b] their ordering; [c] their numerical value; [d] and their names […] *These names have meanings only in Phoenician (or Semitic in general), not in Greek (or Indo-European).* […]

The Greeks created an alphabet capable of transcribing all the segmental components of the Greek language *by adding signs with vocalic value to the consonantal inventory of Phoenician*. The signs of the Greek alphabet constitute the basis of all alphabets that developed in the West."

DANIELS & BRIGHT 1996 : 261. [My italics and parentheses, JCB]

Note 5

Cf. Moltke's point 3 (Note 3)

Note 6
"I hope to point out throughout the course of this investigation that *we simply do not know with certainty* where the runes come from and that *we should keep an open mind* concerning investigations which reevaluate the data and come to conclusions which do not agree with presently or formerly held beliefs. *To assume a priori that the runes cannot be older than the birth of Christ, is not only based on insufficient evidence, but it also leads to fallacious interpretations* of the inscriptions themselves.

I intend […] to bring to light the many *striking similarities* which the runic tradition *shares with* the Mediterranean epigraphic traditions. […] by examining the Greek and Latin traditions in their *preclassical stages, for* this is the period in which *a source for* runic tradition must be sought. Similarities between the runic writing system and the *archaic* Latin and Greek systems have *heretofore been ignored or explained away* as being the result of imperfect attempts by a primitive Germanic people to master epigraphic writing, *because scholars sought to* compare the runic tradition with *the highly refined classical traditions of Imperial Rome and Hellenistic Greece*. Strikingly different results are obtained when the runic tradition is juxtaposed to the Mediterranean traditions in their earlier stages of development."

MORRIS (1988:1-2) [My italics JCB]

Note 7
The English version (MOLTKE 1985: 66) includes a passage that is not included in the Danish version:
"On this point I have had a laconic query from Michael Barnes, of University College London, who asks, "Isn't the p-rune ᛕ ᛒ with two of the side staves moved?", and adds, "Cf. the phonetic relationship of p and b." Brilliant! He must certainly be right. It then becomes illuminatingly obvious that ᛕ was modelled on an existing ᛒ , in the same way as we may legitimately suppose that ᛟ o was hit upon, "designed", after ᛜ ng and ᛗ after ᛘ (Σ) e (though in these there is no "phonetic relationship" to compare) *[Yes, indeed, in the Semitic words, or syllables,* AYIN/OJING ('eye', 'øjne'), MEM/EM/ME*, cf. my interpretations, JCB]* In all probability the first runic forms to be sanctioned were those that were directly copied from Roman capital letters, ᛒ < B, ᚠ < F, ᚱ < R, and so on."

a. Col. XXVII, Epigraphic South Arabian script (forms in parentheses are of the North Arabic type, found in some older inscriptions); col. XXVIII, Later South Arabian script; col. XXIX, "Thamudic" type of Ethiopic script; col. XXX, Ethiopic consonantal script. The order of letters in this table is artificially based on the North Semitic order; for the ancient South Semitic order, see SECTION 68.

Note 1

"The Semitic languages are spoken across major sections of the Old World […] In ancient times they were spoken in the area of south-western Asia known nowadays as the *Near East or the Middle East, from the banks of the Tigris in the east to the Mediterranean in the west, and from the Armenian mountains in the north to the Arabian peninsula in the south*; then, as now, they were used alongside a variety of languages from other families." [My italics, JCB]

DANIELS & BRIGHT 1996 : 88

Note 2

"The runic futhark, so named from the first six symbols […] in the traditional common Germanic sequence of its letters, is *of uncertain origin*. It *may* have been *the creation of an individual familiar both with the Roman alphabet*, as there are many formal parallels, and with some northern Italic alphabet or alphabets which share some more unusual runic forms as well as the variable directions of writing found in some runic inscriptions, but not in Latin. *That the futhark was invented in Denmark has been argued strongly by Moltke* (1985: 64-65).

The earliest runic inscriptions from Denmark and Schleswig-Holstein are all on portable objects dating from the first century C.E. Others, also using the common Germanic futhark, belong to the period of the Germanic migrations and have been found in various parts of central Europe. Despite some minor formal variations, *they all show remarkable uniformity of lettering and variable direction of writing*. Their language has been called "Runic" or, better, "Northwest Germanic." [My italics, JCB]

DANIELS & BRIGHT 1996 : 333

Note 3

"Let us conclude our survey by summarising:

(1) The presence of two i-runes shows that the futhark was created not later than the end of the second century AD (This idea is now obsolete, as the ï-rune originally stood for c4).

(2) The oldest known runic inscriptions (Øvre Stabu, Illerup) are dated on archaeological evidence to c. AD 200, but if the inscription on the Meldorf fibula is runic – and of course it is – then the date of our earliest inscription has to be moved back by another 150 years, to c. AD 50. If we follow cautious practice in alphabet history and allow one or two centuries of as yet undiscovered finds to precede the oldest known inscriptions, we arrive at a date around the birth of Christ, or perhaps as far back as 100-150 BC, for the origin of runes. It might seem safe to say the year 0± 100 (50) years.

(3) For chronological reasons the runes cannot stem from the Phoenician alphabet, and for reasons of letter-shape they cannot be derived from the Greek alphabet (particularly not Greek cursive). Derivation from Etruscan is ruled out by letter-shapes and by principles of

alphabet history (cf. also point (7) below).

(4) Runes are based on the Roman capital letters of imperial times. Some ten were taken over directly, others were imitated, and some completely new signs were invented.

(5) The futhark's independence of classical alphabets is shown in its new sequence of the letters, which is as unaccountable in phonetic terms as the original alphabetical order of the Phoenicians.

(6) The oldest runic inscriptions have all the primitive characteristics observed in the early phase of the classical alphabets (several centuries before the runes came into existence): irregularity of size and line, writing direction both to right and left, bustrophedon, inconsistent or non-existent punctuation, and the fact that each rune has its individual name. [The younger futhark inscriptions have the same characteristics, cf. e.g. Glavendrup, JCB]

(7) Points (4)–(6) lead to the conclusion that the futhark could not have arisen in the immediate vicinity of the classical alphabets.

(8) Judging from an abundance of early inscriptions in a relatively confined area, Denmark is the most likely place for the invention of runes. They were an independent creation based on Roman writing. The inspiration could have come from the Rhineland."

MOLTKE 1985: 64-65

Note 4

"Semitic consonantal writing, as developed and attested in the North Semitic scripts, was the ancestor of three geographically and linguistically diversified developments: […] and the third spreading toward the west, where it led to the creation of fully alphabetic writing systems for the Indo-European languages.

[…] of the Phoenician consonantal script (22 signs) to the Greeks […]

The derivation of the Greek alphabet from the Phoenician script is evident from: [a] the shapes of the letters, obvious despite reflection, elaboration, or simplification; [b] their ordering; [c] their numerical value; [d] and their names […] *These names have meanings only in Phoenician (or Semitic in general), not in Greek (or Indo-European).* […]

The Greeks created an alphabet capable of transcribing all the segmental components of the Greek language *by adding signs with vocalic value to the consonantal inventory of Phoenician*. The signs of the Greek alphabet constitute the basis of all alphabets that developed in the West."

DANIELS & BRIGHT 1996 : 261. [My italics and parentheses, JCB]

Note 5

Cf. Moltke's point 3 (Note 3): "(3) For chronological reasons the runes cannot stem from the Phoenician alphabet, and for reasons of letter-shape they cannot be derived from the

Greek alphabet (particularly not Greek cursive). Derivation from Etruscan is ruled out by letter-shapes and by principles of alphabet history (cf. also point (7) below)."

[6] **Note 6**

"I hope to point out throughout the course of this investigation that *we simply do not know with certainty* where the runes come from and that *we should keep an open mind* concerning investigations which reevaluate the data and come to conclusions which do not agree with presently or formerly held beliefs. *To assume a priori that the runes cannot be older than the birth of Christ, is not only based on insufficient evidence, but it also leads to fallacious interpretations* of the inscriptions themselves.

I intend […] to bring to light the many *striking similarities* which the runic tradition *shares with* the Mediterranean epigraphic traditions. […] by examining the Greek and Latin traditions in their *preclassical stages, for* this is the period in which *a source for* runic tradition must be sought. Similarities between the runic writing system and the *archaic* Latin and Greek systems have *heretofore been ignored or explained away* as being the result of imperfect attempts by a primitive Germanic people to master epigraphic writing, *because scholars sought to* compare the runic tradition with *the highly refined classical traditions of Imperial Rome and Hellenistic Greece*. Strikingly different results are obtained when the runic tradition is juxtaposed to the Mediterranean traditions in their earlier stages of development."

MORRIS (1988:1-2) [My italics JCB]

Note 7

The English version (MOLTKE 1985: 66) includes a passage that is not included in the Danish version:

"On this point I have had a laconic query from Michael Barnes, of University College London, who asks, "Isn't the p-rune ᛕ ᛒ with two of the side staves moved?", and adds, "Cf. the phonetic relationship of p and b." Old Assyrian Metal Trade, its Volume and Interactions

Hakan Erol (https://orcid.org/0000-0003-0089-1010)

Ankara University, Faculty of Languages and History-Geography, Department of Ancient Languages and Cultures

Keywords: Old Assyrian, Ancient Anatolia, Colony Period, Commerce, Metals

The information based on written sources about the period roughly 1972- 1718 BC, known as the Old Assyrian Colony Period in Anatolian history, comes from more than 23,000 Old Assyrian cuneiform texts most of which belong to the Assyrian traders' personal archives which were discovered at Kültepe, ancient Kaniš. Many aspects, especially economy and the commerce practices of the Old Assyrian society in Anatolia, can be studied through these texts. Among them, the records off er detailed information about the metals in circulation of the trade. On the subject of Old Assyrian metals, especially on some certain metals, several studies have been produced up to now.[**1**] However, the total volume of the Old Assyrian metal trade and accessing regions of metals has not been evaluated since Veenhof in 1972.[**2**] In this study, I produce a general view especially about the metal trade volume by means of information gathered from the available Kültepe texts.[**3**]

Let me begin by listing some of the problems one comes across in calculating the commercial volumes of traded metals in the Kültepe texts. Firstly, it is not always possible to determine the defi nite amount of a given material in a specifi c context. This is especially due to incompletely known situations and vague concepts used in the records. However, within the available corpus, and by the help of some certain texts in particular, an approximate fi gure for the amount of a metal traded, especially between Assur and Anatolia, can be off ered. Secondly, it needs to be stressed that one specifi c transaction of metal from Assur to Anatolia or vice versa was sometimes recorded in more than one text (as is the case in the texts EL 108; TC 3, 67; CCT 3, 27a and KTS 38a) and that it is not always possible to identify such situations. In some rare cases, the same transaction may therefore be counted twice in the study.

It also needs to be stressed in advance that although the long distance trading traffi c between Assur and Anatolia seems to be continued nearly 250 years according to the chronological data,[**4**] by far the most intense period of its documentation, nearly 90% of it, in fact, comprises just over 30 years between 1893 and 1863 BC.[**5**] Therefore, one must keep in mind that the results obtained from the texts scanning do not comprise all 250 years of Colony Period, but compress data on volume into a much denser time-frame.

1. Silver

Because of its intensive use especially as a currency during the Old Assyrian Colony Trade, silver (KÙ.BABBAR; kaspum) appears in almost half of the Kültepe texts. Due to some of the obstacles related to available texts mentioned above, an accurate amount of silver that transported from Anatolia to Assur cannot be calculated for certain. However, some signifi cant types of texts, such as business reports, which were sent from Assur in particular, and in which the amount of transported silver were recorded (i.e. caravan accounts),[**6**] some witnessed records that include the amount of the taxes paid silver which are to be entrusted to the transporter(s) (i.e. the transport contracts) and some letters that specify silver transported to Assur (e.g. notifying messages)[**7**] provide some measure of the volume of silver transported to Assur.

The total amount of silver shipped from Anatolia to Assur according to this study was at most 232 talents, 22 minas (approximately 7 tons).[**8**] This sum is a result of simply adding up amounts recorded in all texts that refer to the transport of silver and where the direction of movement from Anatolia to Assur is sometimes in doubt. According to 510 texts, the total amount of shipped silver to Assur is at least 174 talents, 30 minas (approximately 5 tons 220 kg). Considering the total number of 23.000 texts excavated at Kaniš, and including those not yet edited, Larsen gave an estimation of about 12.5 tons of silver sent to Assur by the Assyrian traders during the period of 30 years.[**9**] This amount seems not too far from the results of the calculations presented here.

a. Qualifi cations of Silver

The Assyrian records use several qualifi cations about silver and its shapes, varieties, qualities, etc.[**10**] These are the known qualifi cations known at the moment, alongside some of their translations into English, when known: SAHAR. BA “in its dust”;[**11**] *tirum*; [**12**] *līṭum*; [**13**] *hušā’ū* “scraps”;[**14**] *šabartum*$^{?}$ “lump”;[**15**] *ṣarrupum* “purifi ed”;[**16**] *amurrum* “checked$^{?}$ ”;[**17**] *ha’atim* “faulty$^{?}$ ” ;[**18**] *massuhum* “dirty”;[**19**] *damqum* “fi ne”; and *ša ma-a-sú*.[**20**] The meanings of some of these terms are still uncertain or contradictive.

b. The Artifacts Made of Silver

Compared to the common attestation of silver in the texts, there are a limited number of silver artifacts recorded. In addition, we are not certain in what shapes the silver was traded inside Anatolia or taken to Assur. The most common artifacts made of silver in the texts are “ring”; *hīdum* “bead”; *šawirum* “bracelet/ coil”; *supannum* “a cup”; *tuditum* “brooch/pin”; *kassum* “cup”; *ilum* “divine fi gurine” and *libbum* “heart fi gurine”.

c. Silver and the Anatolian Cities

One of the main reasons that Assyrian traders established themselves in Anatolia must have been its wealth of silver, the acquisition of which was one of the main goals of the traders. The Taurus Mountains, parts of which were called the “Silver Mountains” in some Mesopotamian records,[**21**] has been known for its rich silver deposits since ancient times. [**22**] Consequently, these deposits must have been mined by local Anatolians in the Colony Period and constituted the origin of a large part of the silver in circulation during the period.

The cities from which the Assyrian traders obtained the silver can be determined by reference to the texts. Accordingly, except for Kaniš, Assyrian traders transported and sold their goods for silver mainly in Purušhattum, Wahšušana, Turhumit, Šalatuwar and Hattum. The cities of Purušhattum, Wahšušana and Šalatuwar were located in the western part of Central Anatolia and were probably important market centers for the circulation of the silver, rather than being producers themselves.[**23**]

Judging from the recorded silver in the commercial texts for which a geographical location is explicitly provided for the acquirement of silver, by far the largest markets appear to have been Purušhattum and Wahšušana (see fi gure 1). Together they account for 76% of the total attestations among the other cities. The image provided by the origin of the silver acquired through commercial activities supports the image of a western directionality of the trade fl ow also obtained in recent studies of the geography and underlines the importance of the western circuit for Assyrian business in Anatolia.[**24**]

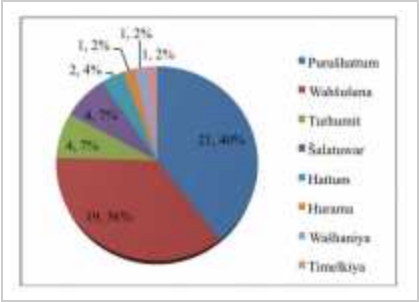

Figure 1. The number of attestations and the percentages of the cities in which the Assyrian traders obtained silver through commercial transactions (except Kaniš)

2. Gold

Gold (hurāṣum; KÙ.GI/KÙ.KI) is recorded with weight specifi ed in more than 600 Kültepe texts. The occurrences can be classifi ed into three main groups: gold shipped to Assur; gold invested in the naruqqum-partnerships,[**25**] and gold credited in loans. As in the case of silver, it is not easy to calculate the exact amount of gold transported from Anatolia to Assur, but the same criteria can be implemented for calculating the approximate volume of metal shipped.

The total amount of gold recorded in the texts comes to about 16 talents 5 minas or approximately 482 kg. Out of this sum, 5 talents 49 minas (approximately 175 kilos) are credits invested in *naruqqum*-partnerships. Those partnerships were one of the main types of commercial venture in Assyrian merchant society. Although the actual investment in *naruqqum*-partnerships was mainly made in silver, these were calculated in gold. Consequently, it needs to be emphasized that the gold recorded in this type of investment must be considered generally as fi ctive gold equivalencies.

In addition to the *naruqqum*-partnerships, some 2 talents 26 minas of gold (approximately 73 kilos) were credited to others as loans. Also these amounts may to a small or large extent have been expressed as gold currency and do not necessarily relate to a physical volume of metal.

This leaves at least 3 talents 2 minas (approximately 91 kilos) of gold shipped to Assur from Anatolia during the Colony period, corresponding to about 3 kg per year on average during the 30 densely documented years. This total seems very low because it is known from the letter Kt 79/k 101[**26**] from the *waklum* of Assur to *kārum*-Kaniš that one of the Assyrian policies was to hoard the gold in Assur. Hence, Assyrian authorities must have given special importance to the import of quality gold by the Assyrian traders both in Anatolia and elsewhere. When the Assyrians nevertheless seem reluctant to obtain the gold in order to ship it to their home city,[**27**] the reason may have been the high risk of incurring a loss when exchanging gold into silver due to diffi culties determining its degree of purity. There are several examples showing that Assyrian traders could sell their gold inside Anatolia as well. Furthermore, according to Kt 92/k 347[**28**] translated below, it seems as if the Assyrian *līmum*-offi cials did not always approve of the quality of the gold that was being transported to Assur, and that gold of poor quality could also be sold to people of *hupšum* class:

[1-3)] To Luzina and the trader, from Ilī-bāni: [4-7)] We showed the gold that I brought to the *līmum*-official and they off ered four shekels of (silver for per shekel of gold). [8-12)] We will sell the gold and make purchases and then I will set out and come. [13-16)] There is no member of the *hupšum*-class[**29**] who will take the gold![**30**]

a. The Qualifi cations and the Prices of the Gold

Ten kinds of gold are recorded in the Kültepe texts: *liqtum*, [**31**] *pašallum*, [**32**] *kupuršinnum*, [**33**] *ša tiamtim* (“of the sea”),[**34**] *pāṣi’um* (“white”),[**35**] HU.SÁ / *sāmu* = “red”);36 *ša damē* (“blood”),[**37**] *kīšum*[**38**], *sādum*, [**39**] and *zakium* (perhaps “pure”).[**40**] The precise meaning of some of these terms is still not known.

The following set of terms was used to specify a quality and/or feature of the gold: *damqum* (SIG5) “fi ne”, *damqum watrum* (SIG5 DIRI) “extra fi ne”, *ša mā’īšu* “good”,[**41**] *ša mātim* “of the country”,[**42**] *ša mahirim* “of the market *(pašallam ša mahirim* in Kt n/k 1566: 78)”, *ša harran ālim* “for sending to Assur”; *ša šabšulim* “for smelting”.

The price ranges between 3 1/3 and 15 shekels of silver per shekel of gold. The reason for this variance appears to stem from great diff erences in purity. As stated above, the most inexpensive type of gold – the HU.SÁ or "red" gold – presumably contained a high rate of copper. The most expensive type was *liqtum* of "select" quality. The most commonly traded gold types were *pašallum* with an average exchange ratio with silver being 8:1, and *kupuršinnum* with the average unit price being 6:1. It seems that there was no diff erence in the exchange rate between gold and silver in Anatolia and Assur.

b. Artifacts Made of Gold

Gold was generally used in molded shapes such as rings (*annuqum*) and beads (*hīdum*) in the commercial circulation. In addition, it was also traded in the form of ore (*ša abnišu*). Except for the rings and beads, artifacts and shapes made of gold recorded in the Kültepe texts include *šamšum* "a sun disc", *kassum* "a cup", *supānum* "a type of container", *takaltum* "a sheath? ", *ilum* "a divine fi gurine", *ūrum "a vulva fi gurine", tudittum* "a pin or brooch", *zimizzum* "a kind of bead", *kiplum* "gold foil", *uqurtum* "an object", and *iṣṣabtū* "earrings".

c. Gold and the Anatolian Cities

The Assyrian traders had access to gold mainly in the cities located in the western part of Central Anatolia. The most prominent of these cities is Wahšušana, which is recorded in 18 texts as place where gold was obtained. In the debt note Kt n/k 1426 from the archive of Uṣur-ša-Ištar, Wahšušana is specifi ed as the origin of the good-quality *pašallum* gold.[**43**] Wahšušana is generally thought to have been located somewhere south of modern Ankara, perhaps on the banks of the Kızılırmak River west of Kültepe.[**44**] The location of Purušhattum remains disputed, but a comprehensive recent study points to the area between modern-day Konya and Afyonkarahisar, probably near modern Akşehir.[**45**] The city attested in eight texts as a place in which the gold was acquired. Finally, another western city, Šalatuwar, which was probably located at or near the confl uence of the Sakarya River and Porsuk Çay,[**46**] occurs four times as the source of gold for the Assyrian traders.

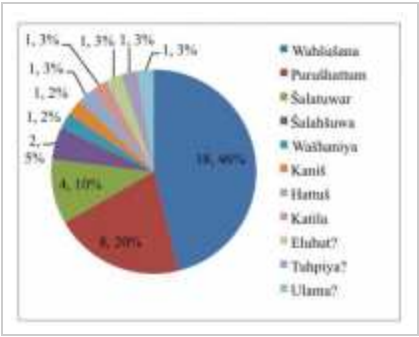

Figure 2. The number of attestations and the percentages of the cities from which the gold was acquired according to the records from Kültepe.

d. Possible Sources of Gold

Anatolia is one of the main sources of gold in the Eastern Mediterranean and the Near East. Especially the regions of Western[**47**] and Northeastern Anatolia and Southern Caucasus have substantial gold reserves. Signifi cant ancient mining activities have been determined in these latter two regions.[**48**] Gold in Western Anatolia is documented through more detailed studies through ancient workshops. Especially the Sardis River is well known as a main source of wealth of ancient Lydia and gold workshops have been found in the archeological excavations of its capital city.[**49**] Golden artifacts found at Alacahöyük near modern-day Çorum, and dated to the Early Bronze Age, brings to mind that there were likewise gold resources in that region, or at least in the periphery of it. The Çoruh River basin on the southern side of the Black Sea mountain range has been suggested as a source of these artifacts.[**50**]

The well-known passage in Gudea Stat. B VI 33-35 that: *"he extracted gold in its dust from the Hahhum mountain"* illustrates that one of the sources of gold for the Mesopotamian cities was Hahhum on the western bank of the Euphrates River in Southern Anatolia.[**51**] According to Steinkeller, along with the gold of Hahhum, there are important

gold sources in Bolkardağ mining region in the Taurus Mountains. He states that the local cultures of Anatolia, Northern Syria, and especially Northern Mesopotamia received gold primarily from these sources through third and early second millennium BC.[**52**]

3. Tin

The main commercial good of the Old Assyrian metal trade was tin (AN. NA = *annakum*). The metal as a commodity is recorded in a large number of Kültepe texts. The volume of tin transported to Anatolia is diffi cult to calculate or estimate, given the diffi culties of sometimes deciding whether a given amount was being shipped from Assur to Anatolia, or whether it was in circulation inside Anatolia in transit from one town to another. Besides, as in the case of some of the other metals, but much more so in the case of tin, it is sometimes diffi cult to prevent the same transaction from being counted twice due to uncertainty about whether it might appear multiple times across diff erent records. Finally, the total value declared (*awītum*) of merchandise and equipment contained in a caravan traveling from Assur to Kaniš was calculated in tin.[**53**] Accordingly, it is generally not possible to estimate the actual proportion contained in a given shipment.

The total search of the Kültepe texts has produced an amount of at least 2360 talents (approximately 70.8 tons) of tin. It is determined that at least a total of 1383 talents (approximately 41.49 tons) of tin whiten all these amounts were sent from Assur to Anatolia. The total amount of *awītum* apart from this fi gure comes to 714 talents (approximately 21.42 tons) of tin. Since at least one-third of the *awītum* would on average have been constituted by actual tin bars, one can thus determined that at least 1600 talents (approximately 48 tons) of tin was shipped from Assur to Anatolia, mainly during the 30-year period c. 1893-1863 BC. At least 75 talents (approximately 2.25 tons) of the tin included in this sum was used for expenses (*annak qātim*) paid by the caravans on the road to Anatolia.

a. Qualifi cations and Prices of Tin

Tin was probably mainly traded in the shape of plates or ingots (*lē'um*).[**54**] However, a few texts state that tin could also be cast into beads (*hīdum*).[**55**] Records refer to two kinds of tin *mašitum*, [**56**] and *mazīrum*, [**57**] both of uncertain meaning, but apparently not mutually exclusive. The adjectives used to express the quality of the tin were *damqum* (SIG5) "fi ne"; *damqum watrum* (SIG5 DIRI) "extra fi ne"; *zakium* "pure"; *massuhum* "bad"; *ṭapšum* "bad? ", [**58**] and *lemmenum* "very bad".

Assyrian traders purchased the tin in Assur at a price for ranging from 11 shekels to 17 1/3 shekels of tin for one shekel of silver with an average price of 15:1.[**59**] The diff erence in price seems to have depended mainly upon its availability in the time of purchase with quality as a secondary factor. The tin was sold in Anatolia at a price ranging from 4 to 10 shekels of tin per shekel of silver, depending not only upon quality and demand, but also upon whether it was sold for cash or on credit. The average price of tin in Anatolia was 7 shekels to 1 shekel of silver.[**60**]

b. The Tin Trade in Anatolia

Except for those who used the smuggling road (harran sukinnim) to reach to the copper market at Turhumit[**61**] located generally north of Kaniš, almost all of the Assyrian caravans arrived at Kaniš fi rst. The goods could be sold for cash on the spot there, or credited to other agents or retail sellers, or they could be shipped further into Anatolia for more profi t. The cities to which the tin was shipped after Kaniš can be clearly identifi ed by searching the texts. As already predicted by the geographical analysis of the Kültepe-texts,[**62**] these cities can now be shown to cluster to the west of Kaniš, i.e. on the border to Western Anatolia. As seen in the chart below, the most commonly attested cities as a destination for the tin are Purušhattum and Wahšušana.[**63**]

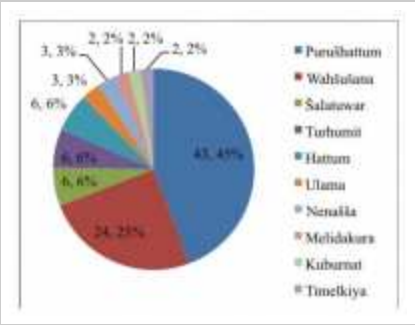

Figure 3. The number of attestations and the percentages of the cities to which Assyrian traders transported the tin at least two times in the texts.

4. Copper

Copper (URUDU = *werium*) is one of the most commonly attested metal in the Kültepe texts. It is clear that the Assyrian traders limited their trade in copper to the area inside Anatolia. There are a few attestations of copper going to Assur, but in those rare cases, the copper appears mainly as currency to cover travel expenses, or in the form of funds sent to family members in Assur. Hence, the commodity was not one of the goods traded between Assur and Anatolia.[**64**]

a. Qualifi cations and the Price of Copper

The total weight of all copper attested in the Kültepe texts comes to around 315 tons covering many diff erent forms and qualities. Some of the commonly recorded qualifi cations used about copper are masium “washed”; *ṣallamum* “black”; *damqum* “fine”; *damqum watrum* “extra fi ne”; *zakium* “pure”; *lammunum* “bad (quality)”; *massuhum* “dirty” and *šikkum/šabburum* “broken”; *ša šadui-šu* “native copper”; *ṣahhirum* “small pieces”. A detailed study of the copper trade, qualities and origins was conducted in Dercksen 1996. The great infl ux of newly edited texts confi rm his main conclusions with the diff erence that the geography of the trade is now better understood than previously.

Among the cities involved in the trade, Turhumit was the central market, and especially Haburata, Kunanamit, Taritar, and Tišmurna are prominent as sources of copper. As in the case of other metals, the price of copper diff ered in relation to supply and demand, proximity production sites, and quality of both the copper and the silver used as currency.[**65**]

b. Copper and the Anatolian Cities

Anatolia has a multitude of copper deposits and some of its sources are known to have been exploited since the Chalcolithic. The Assyrian traders acquired copper primarily from cities located to the north of Kaniš and shipped the major part of it to the western part of Central Anatolia, with some additional traffi c in the direction of Kaniš.

The traders generally procured the metal in Turhumit, Tuhpiya, Tišmurna, Taritar, and Marithum, all thought to have been located Middle Black Sea Region in the north. Some records show that the Assyrian traders acquired copper in Wahšušana and Kaniš as well, but there it seems the transactions were mainly in copper that was in transit and did not originate there. As for the cities to which the copper generally was shipped or sold in, Purušhattum, Wahšušana, Šalatuwar, Kaniš, and Ulama are prominent.[**66**]

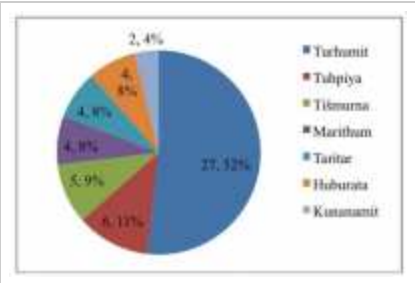

Figure 4. The number of attestations and the percentages of the cities which are attested at least two times as copper obtained centers and qualifi ed as origin of the copper in the texts

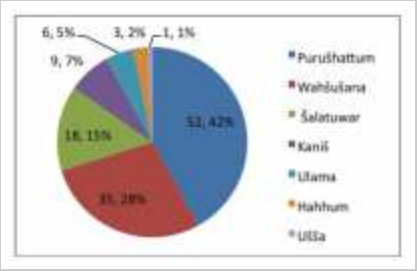

Figure 5. The number of attestations and the percentages of the cities to which the copper was shipped there for sale.

5. Bronze

A main factor behind the Assyrian trade in Anatolia and its continuation for more than 250 years was probably the bronze alloy. Each year, the Assyrian caravans transported tons of tin that was especially needed by Anatolian authorities in order to produce this hard alloy.[**67**] However, interestingly bronze was not really a commercial commodity in this lucrative trade. Furthermore, the number of bronze artifacts discovered at Kültepe is relatively low compared to the huge amount of tin shipped from Assur to Anatolia.[**68**] The reason for this apparent discrepancy is unclear.

In comparison to most other metals, there are only limited references to the bronze in the Kültepe texts. The alloy is recorded in about 80 texts under the sumerogram ZABAR or as Akkadian *siparrum*. In addition, we fi nd the phrase GAL ZABAR (literally “large (of) bronze”) which is always counted by number and not measured by weight. Finally, one fi nds occasional reference to *siparātum* “bronze nails”.

The total weight of bronze in the texts amounts to 7 talents and 47 minas (approximately 234 kg). Out of this sum, 3 talents 8 minas (approximately 94 kg) are the weight of manufactured objects. There is also a total of 317 GAL ZABAR mentioned in the texts. The total number of *siparātum* comes to 1743.

There is only one text listing the value of bronze in relation to silver and copper. Kt n/k 1697[**69**] records that 1 shekel of silver costs 11 shekels of bronze and also mentions GAL ZABAR, which it divides into three groups of 105 pieces each one of weighing 18, 18 and 20 shekels each. The text also shows that the price of one piece of GAL ZABAR was about 1 mina of broken copper (*eri’um šikkum*).

Bronze was used extensively to cast household artifacts as well as weapons. A long series of terms for diff erent kinds of bronze objects appear in the Kültepe texts. The most commonly attested artifacts are kitchenware, such as *itqurum* “spoon” and *kassum* “cup”. For example, a single text records 83 diff erent kinds of bronze artifacts; another one lists 76 diff erent objects.[**70**]

Colony Period has been insignifi cant in comparison to the intensive trade of tin and copper evidenced in the texts. One of the reasons for this could be that most of the metal was in fact shipped to cities in part of Anatolia and taken to even more remote regions.[**71**] One can also assume that metal utensils have been widely melted down and re-used or plundered by looting armies.[**72**]

6. Iron

The study for this article shows that the metal referred to alternatively as *amūtum, ašium, parzillum* and KÙ.AN is recorded at least in 200 of the texts from Kültepe. The exact translation of these terms is still debated. KÙ.AN is known to be the logographic writing of *amūtum*. And the text AKT 3, 45 suggests that *ašium* was another synonym for *amūtum*. [**73**] Finally, *parzillum*, attested in very few Old Assyrian texts and its logographic writing AN.BAR known to denote “iron” in other cuneiform corpora does not occur at Kültepe.

It has been generally suggested that the terms *amūtum* and *ašium* were used for “meteoric iron”.[**74**] However, some researchers do not accept this suggestion and pointing out that due to its high content of nickel, meteoric iron could not be processed in the ways attested for *amūtum* with the technology of that time.[**75**] For the purpose of the current

study, the neutral term “iron” is retained for all four writings.

The total amount of iron recorded in the Kültepe texts comes to more than 30 minas (about 15 kg), but it must be stressed that in some cases the same iron may be counted twice because it is impossible for some cases to determine whether two records refer to the same transaction. When taking into consideration its price and the fact that the Kültepe texts were written about 500 years before the beginning of the Iron Age in Anatolia, the amount of iron in the

a. The Qualifi cations and Price of the Iron texts is astounding.

Five diff erent shapes of iron are attested in the texts: *ṣahhartum* “small pieces”; *kiṣrum* “lump”; *abnum* “stone” and *ša* KI.DIRI “raw iron” (which contains other minerals). In the unpublished text Kt n/k 67: 11 an amount of pure (*zakūtum*) KÙ.AN is qualifi ed as *ša harsa* the meaning of which is unknown. It is not certain whether it refers to a toponym or perhaps signifi es a special type of iron.[**76**] The most commonly attested artifact made of iron is *annuqum* “ring”. One can learn from a text that a ring made of *amūtum* could also be adorned by wrapping with gold.[**77**] Other objects include *tudittum* “pin/brooch”, *kassum* “cup”, *urākum* “bar”, and maybe even *šinnātum* “teeth” (Kt 94/k 208).[**78**] Adjectives used to qualify iron are: *damqum* (SIG5) “fi ne”; *damqum watrum* (SIG5 DIRI) “extra fi ne”; *zakium/zakītum* “pure” and *ša šarruttim* “of royal quality.”

Information about the price of iron is found in about a dozen texts and fluctuates greatly between 11 2/3[**79**] to 140 shekels of silver per shekel of iron. This huge diff erence must be related to its kind and degree of purity and cannot simply be ascribed to the forces of market. According to Kt n/k 1697:[**80**] 34, the price for one shekel of *parzillum* was 20 shekels of silver. The price of *amūtum* alone ranges between 40 and 140 shekels of silver.

The iron seems to have been used mainly to produce jewelry and ornaments, presumably due to of its scarcity. There is no mention of weapons made from iron in the archeological excavations at Kültepe. However, an unpublished texts (Kt b/k 93+167) that lists especially diff erent kinds of cups mentions “a big dagger handle of which was made of iron (*amūtum*) and gold”.[**81**] Apart from Kültepe, an iron dagger with gold handle was discovered among the iron artifacts of Alacahöyük, dated to the Early Bronze Age[**82**] and the Anitta-text famously mentions that the Great King of Purušhattum brought him a gift of an iron throne and an iron scepter.[**83**]

Assyrian traders purchased the iron not only form the city hall *bēt ālim/līmim)* in Assur, but also within Anatolia, and they sold this valuable metal to Anatolian elites where it was in demand.[**84**] The source of the iron purchased in Assur is not known, but it may be assumed that the origin of most of the iron traded in Anatolia was of local origin.[**85**]

It is clear that the city of Assur paid special importance to the trade in iron. The reason for this could be the *išrātum*-tax (the tithe; 10%) levied initially by the City Hall and later by the *kārum* Kaniš.[**86**] The *kārum* authorities at Kaniš were notifi ed about this decision passed by the City Assembly and forwarded the required instructions on the matter to the remaining Anatolian colonies by the letter AKT 5, 1 (Kt 92/k 221). This text is undated, but considering the years in which the owner of archive in which it was found was active, Veenhof assumes that the text should date to the end of the lower town Level II at Kaniš.[**87**]

A damaged *waklum*-letter Kt 92/k 432 excavated in the same year, but said to belong to a diff erent archive recounts another decision made by the City Assembly, namely that no *kārum* should levy the *šaddu’utum* and *išrātum*-tax on *amūtum* metal and Akkadian textiles that had been bought directly from the City Hall by Assyrian traders. It is clear from the text that this decision was made in regard to a certain Aššur-lamassī, but that it also involved other merchants in the same situation.

[1-4)] From the Chairman *(waklum)* to Puzur-ilī, Titinatal, the envoys of [the city of Assur], and the *kārum* [Kaniš] [5-15)] [……] [16-22)] […] the silver to […] if Aššur-lamassī […] is not present [in …] [… to] the representatives of [Aššur-lamassī] [23-27)] [……..] [28-32)] You shall not take the […….] of the *amūtum* that Aššur-lamassī bought (from) the City Hall. [33-39)] In addition, (the authorities of) a *kārum* to which Aššur-lamassī has shipped the amūtum may not levy the *šaddu'utum* and *išrātum*-tax on the price of the *amūtum*. [40-46)] Apart from Aššurlamassī, you shall not levy *šaddu'utum* and *išrātum*-tax on any *amūtum* or Akkadian textiles from any citizen of Assur who *bought* the *amūtum* or the Akkadian textiles in the City Hall. No matter which (one) it is, no other *kārum* can levy it (either).[**88**]

7. Lead

Lead is mentioned in eight Kültepe texts as *abārum* with its weight recorded only in Kt h/k 16: 3 at 20 minas. In the letter TMH 1, 3b, an Assyrian trader complains about the absence of any material for purchase except lead, and in KT 6-d: 789 an Anatolian woman writes her husband to express her anger over him not sending her any funds to feed her and their children. At one point, she asks him what they are supposed to eat, since nobody wants to buy the lead which he apparently left behind for them to sell for their subsistence. At Kültepe, objects made of lead are found in a wide variety of uses, including lead fi gurines and weights.[**89**] However, the low number of attestations in the texts and the instances above show that lead had an insignifi cant place in the Assyrian commerce, presumably due its relatively low value and high bulk compared to other metals.[**90**]

8. Antimony[?] *(Lulūm)*

The term *lulûm*, for which the meaning “antimony” has been suggested (CAD L, 243a), appears in 18 Kültepe texts with a total weight of 20 talents and 53 minas (about 630 kg). If the translation is correct, the use of this metal in Anatolia during the Colony Period is not known. Since it occurs several times alongside copper in the texts, it seems possible that *lulûm* was used in alloys as an alternative to tin and arsenic.[**91**]

Conclusion

The main goal of this study is to off er a general idea about the total volume and geographical scope of the metal trade in Anatolia as evidenced in the Assyrian texts from Kültepe. The information presented here was gathered from nearly 12 thousand texts many of which are still unpublished. In addition to those documents, another 10 thousand cuneiform texts wait unedited in the Ankara Museum. Furthermore, there must still be innumerable documents in the ground at Kaniš, as well as at Assur and in some of the other Assyrian settlements in Anatolia. Many more have of course disappeared over the course of time. Consequently, it is not possible to determine the exact volume of metals traded during the almost 250 years that the Old Assyrian Colony Period lasted. However, this sort of analysis can help estimate the amounts of traded metal and also reveals a clear geographical pattern in the trade that was focused on a small number of Assyrian colonies and generally oriented in a westerly direction.

Footnotes

1. J. G. Dercksen off ered a detailed study of the copper trade (J. Gerrit Dercksen, The Old Assyrian Copper Trade in Anatolia, PIHANS 75, Leiden/İstanbul 1996); a summary of metals attested at Kültepe (J. Gerrit Dercksen, “Metals According to Documents from Kültepe-Kanish Dating to the Old Assyrian Colony Period”, (ed.) Ü. Yalçın, Anatolian Metal III, Der Anschnitt, Beiheft 18, Bochum (2005)), and a brief study on tin (J. Gerrit Dercksen “Zinn”, Reallexikon der Assyriologie, (2017)). K. R. Veenhof studied silver (Klaas R. Veenhof, “Silver in Old Assyrian Trade. Shapes, Qualities and Purifi cation”, (ed.) Zoltán Csabai, Studies in Economic and Social History of the Ancient Near East in Memory of Péter Vargyas, Department of Ancient History, the University of Pécs L’Harmattan, Budapest, (2014)) and Veenhof 2016 iron (Klaas R Veenhof, “A Diffi cult Old Assyrian Business Venture. Mannum-Kī-Aššur Tries his Luck with Iron”, Bibliotheca Orientalis, Jaargang LLXXIII, no. 1-2, (2016)). A broader discussion of the trade volume (including metal) is off ered in Gojko Barjamovic, A Historical Geography of Anatolia in the Old Assyrian Colony Period, Copenhagen 2011: ch. 1.3, and in Edward Stratford, A Year of Vengeance: Time Narrative, and the Assyrian Trans-Taurus Trade in 1891 BCE. SANER, Boston: De Gruyter 2017: ch, 18. Lastly, especially for the prices of the metals and within the contexts of the available texts, L.G. Gökçek produced a detailed list in L. Gürkan Gökçek, “Kültepe Vesikalarında Geçen Nesnelerin Fiyatları”, (ed.) M. Şahin, II. Kayseri ve Yöresi Tarih Sempozyumu Bildirileri (16-17 Nisan 1998), Kayseri (1998).
2. Klaas R. Veenhof, Aspects of Old Assyrian Trade and its Terminology, BRILL, Leiden, 1972: pp. 79-80.
3. The research behind this article was carried out as a visiting scholar at Harvard University with the support of The Scientifi c and Technological Research Council of Turkey (TÜBİTAK). The main target of my research was to fi nd answers to questions related to metals and metal trade in the Old Assyrian Colony Period as recorded in a wide

range of texts. Within the scope of this project, the attestations of gold, silver, tin, iron, copper, and lead metals and bronze alloy were collected from a database that includes nearly 12 thousand Old Assyrian texts, about half of which are still unpublished. I would like to express my gratitude to the TÜBİTAK for the fi nancial support for this research, and to the Department of Near Eastern Languages and Civilizations at Harvard University and my colleagues there Gojko Barjamovic and Piotr Steinkeller for hosting me during my work. I am grateful to G. Barjamovic also for both his editing the language of the article and his valuable comments on it.

4. See for the Old Assyrian Chronology Klaas R. Veenhof, The Old Assyrian List of Year Eponyms from Karum Kanish and Its Chronological Implications, Türk Tarih Kurumu Yayınları, VI/64, Ankara 2003; Cahit Günbattı, "An Aponym List (KEL G) from Kultepe", Altorientalische Forschungen 35, (2008); Gojko Barjamovic, Thomas Hertel, Mogens T. Larsen, Ups and Downs at Kanesh-Observations on Chronology, History and Society in the Old Assyrian Period, Nederlands Instituut voor het Nabije Oosten, Leiden 2012.
5. Barjamovic et all., Ups and Downs, p. 55-57.
6. The terminology of caravan accounts, transport contracts, and notifying messages is adapted from Mogens T. Larsen, Old Assyrian Caravan Procedures, PIHANS, 22 (Leiden : Nederlands Instituut voor het Nabije Oosten), 1967.
7. Larsen, ibid, p. 6.
8. About 30 talents (900 kg) of silver mentioned in texts (e.g. Dalley 12; I, 742) as a currency – awītum or "declared value" – can perhaps be added to this sum. However, one may think that this currency was used for the silver value of other commercial materials that were being brought to Anatolia from Assur and have thus been excluded from the present analysis.
9. Mogens T. Larsen, Ancient Kanesh, A Merchant Colony in Bronze Age Anatolia, Cambridge University Press, Cabridge 2015: 190.
10. Most of these qualifi cations have recently been discussed in detail in Veenhof, "Silver in Old Assyrian Trade".
11. SAHAR.BA "in its dust" does not indicate a type or quality of silver, but its shape. It occurs in about a dozen records, most of which are loan contracts. Silver in this shape is further qualifi ed in CTMMA 1, 87a as being sarrupum, i.e. "refi ned/pure".
12. For detailed information about tiri-silver which occurs in about 50 Kültepe texts, see Mogens T. Larsen, "Four Letters from the Walters Art Gallery, Baltimore", (ed.) B . Hruska ve G. Komoroczy, Festschrift Lubor Matouš, vol.1-11, Budapest (1978), p. 115, Dercksen, "Metals", p. 22, and Veenhof, "Silver in Old Assyrian Trade", p. 397. tiri-silver does not occur with any qualifi cation. It is used as beulātum-credit in a few texts.
13. The term līum, which is attested in numerous loan contracts generally related to the dealings of local Anatolians probably designates a form of silver. It is clear that līum-silver had an Anatolian feature (Veenhof, "Silver in Old Assyrian Trade", p. 396). It is qualifi ed by damqum (SIG5) "good" in some texts.
14. The term huša'um "scrap" occurs only once and is qualifi ed by SIG5 "good": CCT 4, 2a: 7) … 6 mana 8) KÙ.BABBAR hu-ša-e SIG5 "6 minas of fi ne silver scraps". Except for this attestation, this term huša'um is used exclusively about copper in the Kültepe texts.
15. J. G. Dercksen ("metals", p. 22) interprets the term šabartum attested as ša-ba-ar-tám in ICK 1, 171: 6 and as ša-áb-ra-tum in CCT 2, 2: 9 as a "lump".
16. The most common qualifi cation of silver in Kültepe texts is ṣarrupum "purifi ed". It designates the pure silver that had been refi ned through smelting.
17. The meaning of amurrum as a type of silver was formerly thought to designate a source from Amurrum in Northern Syria, but is now known to be derived from the verb amārum "to check" cf. Th. Sturm, "kaspum ammurum, ein Begriff der Silbermetallurgie in den Kültepe-Texten", Ugarit Forschungen 27, (1995).
18. The term ha-at/ṭ-im which occurs only in CCT 1, 104: 7 and was thought to indicate Hattum as a place of origin, cf. Veenhof, "Silver in Old Assyrian Trade", p. 395, n. 6, can also be associated with the adjective hāṭû "bad, faulty" (CDA, 112-b).

19. The word massuhum that is also attested as a qualifi cation of tin, gold, and copper occurs in about two dozen texts about silver in the meaning “poor quality” or “dirty”.
20. This term occurs only in the unpublished Kt n/k 84: 1) 6 1/3 ma-na 3 1/2 GÍN 2) KÙ.BABBAR 6 1/2 GÍN 3) ša ma-a-sú 4) ša A-šur-na-da 5) ku-nu-ki-ni 6) Ṣí-li-d IM 7) ú-bi-il5 -šu-um “Aššur-nādā’s 6 minas 23.5 shekels of silver; 6.5 shekels of it … Ṣilli-Adad shipped to him under our seal”. The word may represent the adjective mādum “much” and not be a qualifi cation of silver.

29. For the term hupšum, cf. J. Gerrit Dercksen, “Some Elements of Old Anatolian Society in Kaniš”, (ed.) J. G. Dercksen, Assyria and Beyond, Studies Presented to Mogens Trolle Larsen, Nederlands Instituut het Nabije Oosten, Leiden (2004), p. 146.
30. Kt 92/k 347: 1) a-na Lu-zi-na 2) ù DAM.GÀR qí-bi-ma 3) um-ma DINGIR-ba-ni-ma 4) KÙ.GI : ša a-niiš-a-/ni 5) li-ma-am 6) nu-kà-li-im-ma 7) 4 GÍN.TA ú-kà-lu 8) KÙ.GI ni-da-an-/ma 9) ší-ma-am 10) ni-ša-am-ma 11) a-ta-bi-a-ma 12) a-ta-lá-kam 13) hu-up-šu-um 14) ma-ma-an ša KÙ.GI 15) i-lá-qé-ú 16) lá i-ba-ší
31. liqtum gold occurs in two texts: Kt 84/k 3: 1 (Veysel Donbaz, “More Old Assyrian Tablets from Assur”, Akkadica 42, (1985), p. 7) and Kt n/k 1697: 1. Salih Çeçen and Hakan Erol, “Kültepe’den Değişik Bir Ticarî Mal Listesi”, Archivum Anatolicum 12/2, (2008), p. 56-58). The unit price is 1:15 shekels in both texts. CAD L, 206a gives “a choice quality of gold and garments” for the fourth meaning of this term, which occurs in Old Babylonian texts. Clearly derived from the verb laqātum “gather, collect” so perhaps “choice gold” is an appropriate translation.
32. pašallum is the most preferred kind of gold by the traders. It occurs in about 30 texts. Its unit price is 8 shekels of silver on average. pašallum gold is generally qualifi ed as “fi ne” (SIG5) or “extra fi ne” (SIG5 DIRI) in the texts, and has been interpreted as “nugget” by Dercksen, “Metals”, p. 26.

33. The term kub/puršinnum is described as a “foreign word” in CAD K, 489b. What feature of gold kub/puršinnum indicates is not clear. The unit price is recorded in about 20 texts at an average of 1:6.

34. ša tiamtim “of the sea” is recorded in four texts: TC 1, 104: 8; WAG 48-1463: 6; Kt 75/k 86: 15; Kt h/k 104: 8. The qualifi cation suggests the gold was literally obtained from the sea (cf. Karin Reiter, Die Metalle im Alten Orient: unter besonderer Berücksichtigung altbabylonischer Quellen, Ugarit-Verlag, Münster 1997, p. 14).

35. hurāṣum pāṣi’um “white gold” suggests gold that containing a high ratio of silver. It occurs at least twice: WAG 48-1462: 24, 27; KTS 1, 52b: 5.

36. The HU.SÁ (sāmum) “red” gold occurs in four Old Assyrian texts: Ass 130058f:2 (Donbaz, “Tablets from Assur”, p. 16); CCT 4, 22b: 19; WAG 48-1462: 17; Kt n/k 1697: 3? (Çeçen and Erol, “Ticarî Mal Listesi”, p. 58). This type of gold is the most inexpensive one (1: 3 1/3), presumably due to its high content of copper (H. Waetzoldt, “Rotes Gold?”, Oriens antiquus 24, (1985), p. 1; Moorey, Materials and Industries, p. 226). The HU.SA gold is once qualifi ed as “very fi ne” (SIG5 DIRI) in CCT 4, 22b.

37. hurāṣum ša damē “blood gold” occurs only in Kt c/k 48: 36 (Kemal Balkan, Mama Kralı Anum-Hirbi’nin Kaniš Kralı Waršama’ya Gönderdiği Mektup, TTKY 7-31, Ankara 1957, p. 13) and has been associated with hurāṣum sāmum, “red gold”, cf. Larsen, “Four Letter”, p. 115 and Dercksen, Metals”, p. 26. However, the “blood gold” is expected to fetch a price of 8.5 or 9 : 1 in the text, which is signifi cantly above what would be expected for “red gold”.

38. kīšum gold is recorded in at least six Kültepe texts: KTK 99: 1; Kt c/k 440: 3, 15; AKT 5, 16: 13’; AKT 7-a, 211: 9, 23, 32; AKT 7-a, 212: 7, 12, 32; AKT 7-a, 240: 6. It is characterized as “kīšum of the land” (kīšam ša mātim) in Kt c/k 440 and qualifi ed as “fi ne” (SIG5) in AKT 7-a, 211 and 212. The meaning of the term is not clear, cf. Dercksen, “Metals”, p. 26.

39. For the sādum gold that occurs only in Kt c/k 18: 25, 40 cf. J. Gerrit Dercksen, “The Goddess Who was Robbed of her Jewellery. Ishtar and her Priest in an Assyrian Colony”, Anatolica 41, (2015), p. 40.

40. It is not certain that the term zakium refers to the type or quality of the gold. zakium, meaning “clear; clean; plain; refi ned” (CAD Z: 23a-b), is recorded as qualifi cation of gold in at least three Old Assyrian texts, one of which was excavated at Assur: Ass 13058e (Donbaz, “Tablets from Assur”, p. 6); Kt a/k 178:2; Kt n/k 1697: 5. The unit price of zakium gold in all three instances is 5.5: 1 in silver.

41. CAD M/II, 156b translates the ša mā’ešu, as “a fi ne quality” (See also Veenhof, Aspects, p. 181). ša mā’ešu gold, which was interpreted literally as “of its water” and thought to refer to “alluvial gold” in Dercksen “Metals”, p. 26, occurs in three additional texts from Kültepe: TC 1, 47: 16; Kt c/k 48: 39; AKT 11-a, 125: 5. This kind gold is recorded as an alternative to kupuršinnum gold in TC 1, 47, but was qualifi ed as kupuršinnum in AKT 11-a: 4) … 4 1/3 GÍN KÙ.GI 5) ša ma-e-šu : ku-pur-ší-ni-im “4 1/3 shekels of ša mā’ešu kupuršinnum gold”. It is therefore diffi cult to suggest a precise translation of this word.

42. The phrase ša mātim “of the land” is attested as the qualifi cation of kīšum gold only in Kt c/k 440: 3 and 6.

43. Kt n/k 1426: 1-5) 3 ma-na KÙ.GI ša Wa-ah-šu-ša-na pá-ša-lam SIG5 i-ṣé-er Hu-ra-sà-nim A-šur-i-mì-tí i-šu “Hurasānum owes Aššur-imití three minas of fi ne quality pašallum gold of Wahšušana”.

44. Barjamovic, A Historical Geography, p. 400-401, 411 suggests identifying Wahšušana with the site of Büklükale on the river, or a site in it relative vicinity.

52. Steinkeller, “The Role of Iran”, p. 128.
53. Dercksen, Old Assyrian Institutions, p. 148-163.
54. The term le’um occurs in just four texts: AKT 3, 49: 24; AKT 6-c, 606: 3; 659: 9; AKT 6-d, 808: 18. J. G. Dercksen (Copper Trade, p. 57) and K. R. Veenhof (AKT 5, 59: 3) take the term to refer to a “metal plaque; plate”, whereas M. T. Larsen prefers to translate them as “ingot” and states that there was not a standard weight of a le’um, its weight fl uctuating between 4 and 12 minas (AKT 6-c, 606: 3).
55. Look for the tin in the shape of beads Sadberg-ARK 154-9472:7, AKT 8, 146: 20 and may be in AKT 8, 357: 4, 6
56. mašitum appears in seven texts: Kt n/k 518: 27, 32; AKT 3, 70: 5; BIN 6, 64: 4, 6, 22; Kt 87/k 366: 2; Kt 87/k 382: 5 (in which mazīru-tin is qualifi ed as being mašitum); Kt 87/k 443: 4; Kt 87/k 448: 5 (hand tin or tin for expenses qualifi ed as mašitum). The meaning and/or origin of this term are not clear. The CAD M/I, p. 389b lists mašitum in BIN 6, 64, under maššītum “delivery; ingredients” and derives it from the verb našā’um. It is also possible to derive it from the adjective maššum “polished” (CAD M/I, p. 390a), which is used as a qualifi er for gold and copper in other sources.
57. The term mazirum appears about ten times in the records from Kültepe, normally qualifying small quantities of tin. The exception is Kt n/k 500: 6 which lists 2 talents 20 minas of mazirum-tin. In Kt 87/k 382 the mazirum-tin is characterized also as mašitum.
58. For the term ṭapšum as a bad quality of tin, see Dercksen, “Metals”, p. 20.
59. Dercksen, ibid, p. 20.
60. See also Larsen, Ancient Kanesh, p. 191.
61. Barjamovic, A Historical Geography, ch. 4.9.
62. Barjamovic, “A Commercial Geography”.
63. The volumes of the shipped tin, and any other commodities, to these cities are not given generally in the texts. According to the calculation of tin shipments, amount of which was directly mentioned in texts, at least 1.5 tons of tin was transported to Purušhattum and at least 930 kilos of tin to Wahšušana.
64. Dercksen, Copper Trade, p. 1-3. İrfan Albayrak, “Uṣur-ša-İštar Arşivinden Bakır Ticareti ile ilgili Bir Mektup”, (ed.) S. Erkut ve Ö. S. Gavaz, Studies in Honour of Ahmet Ünal Armağanı, Arkeoloji ve Sanat Yayınları, İstanbul (2016), p. 26. 25-34.
65. For a detailed discussion see Dercksen, Copper Trade, p. 158-159, 227-230.
66. The amount of the copper transported to these cities is given only in in a limited number of texts. According to calculations of based on these volumes, at least 16,71 tons of copper was shipped to Purušhattum, 3,78 tons to Wahšušana, and 3,07 to Šalatuwar.

ANTIQUITY XXXV, 1961 PLATES XXIV, XXV

Early Bronze Age Colonists in Iberia

by BEATRICE BLANCE

Dr Beatrice Blance, a graduate of the University of Edinburgh, has for the last few years been engaged in research on prehistory in Spain, Portugal and Germany, as a Research Scholar of the Carnegie Trust for the Universities of Scotland, and as a Scholar of the Instituto de Alta Cultura *in Lisbon. In this article she marshals the evidence for the establishment of East Mediterranean colonies in the Iberian Peninsula. Fig.* 1 *is a distribution map of some of the sites mentioned in the text. An appendix to this article lists the sites with bastions and with imported or imitation imported ware.*

THE object of this paper is to show that certain Early Bronze Age sites in the Iberian Peninsula are actually colonies established by people coming from the Eastern Mediterranean.

The term 'colony' is used here in contrast to the term 'culture'. It is selected because, besides being the term used by Siret, who believed that Los Millares was a Phoenician colony, and the Leisners (*Factorei*), it is the term which best describes these sites. The following account will demonstrate that they were solitary, heavily-defended settlements situated in a culturally foreign environment. Their best parallels are to be found in the East Mediterranean area, where, from very early times politically independent city states which owed their existence to either a rich hinterland or to trade and commerce, are known. These sites in the Peninsula may, in fact, be regarded as primitive examples of the types of colonies established later by the Phoenicians and the Greeks.

In the following account the method of investigation is briefly described, but the chief advantages and disadvantages of each method cannot be discussed here. This side of the subject has been fully dealt with in a recent survey (Blance 1960). In this survey it was noticed that before the position of the colonies could be fully understood it was essential to take into consideration the Neolithic cultures present in the Peninsula. These can be briefly summarized as follows.

The earliest Neolithic groups in the Peninsula were the impressed-ware groups. Cardial impressed ware is found chiefly in North-East Spain and around the Tagus Estuary, while non-cardial impressed ware which is found in both these areas is also very common in Southern Spain. The cultural assemblage of these groups was less easy to ascertain, but it certainly included flint blades, trapeze-shaped arrowheads, and bone points and spatulae. The decoration on the pottery was nearly always confined to the upper part of the pot.

The Almeria culture was found principally in South-East Spain where some 150 graves are known, most of which seem to have been used for collective burial. A statistical analysis of the finds from these graves showed that they could be divided into two groups, which reflected a cultural rather than a chronological distinction. The 'indigenous' group was characterized by trapeze-shaped arrowheads, stone axes, bone points and probably also shell bracelets. The other group contained bifacially-worked flint arrowheads, flat idols, green-stone beads, and certain pottery types. It was thought that this group already in-

Downloaded from https://www.cambridge.org/core. University Frankfurt/Main, on 24 Feb 2018 at 15:14:22, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/S0003598X00036188

dicated early East Mediterranean influence in the Peninsula. There was evidence, too, that some of the Almeria graves were more likely to have been communal ossuaries than actual collective tombs, for example, Loma de la Torre 4, which was only 1·20 m. in diameter and 0·50 m. deep contained nine burials (G. and V. Leisner, 1943, 15).

This culture seems to have spread westwards, possibly due to the arrival of Los Millares people in the south-east, and to have played an important part in the formation of the

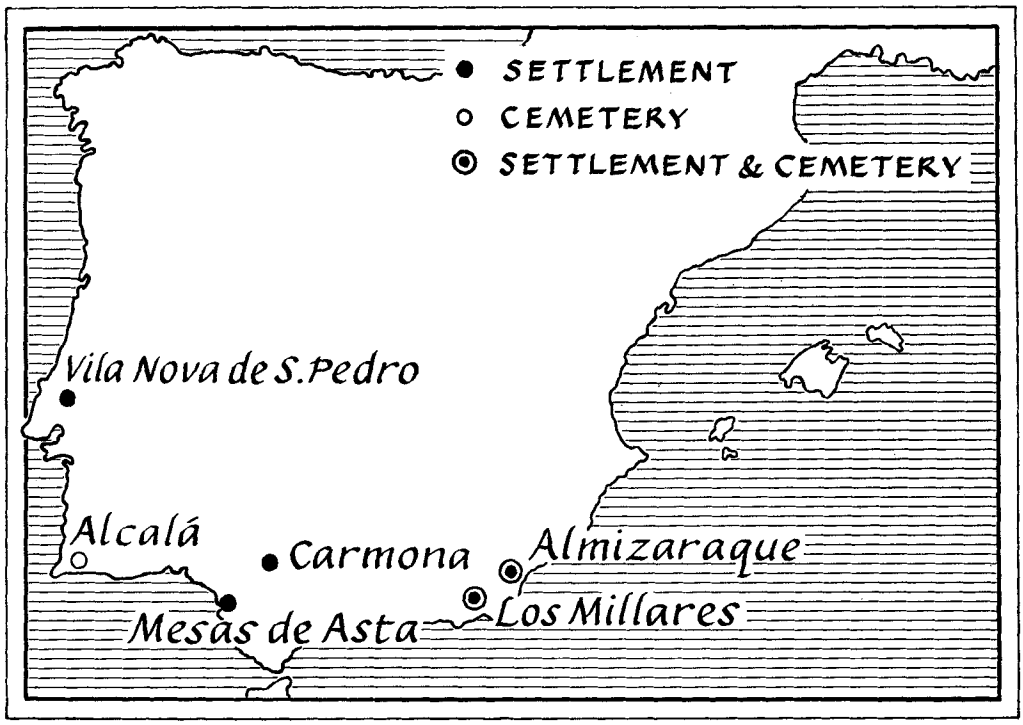

Fig. 1. Settlements and Cemeteries of the Early Bronze Age Colonists in Iberia.

Portuguese dolmen group, which is found chiefly in the Alentejo and South-West Spain. This group was characterized by trapeze-shaped and leaf-shaped arrowheads, stone axes, and decorated slate plaques, which are a later development from flat idols.

In North-East Spain there was an interesting local culture known chiefly from its 'Sepulturas de Fosa'. This culture, as the name suggests, was typified by single burial in earth graves; and the grave goods, which were very characteristic, consisted of stone axes with pointed butts, flint trapezes, bone points, and big olive-shaped callais beads. This group had clear Italian relationships and must be contemporary with the 'Neolitico Medio' of Arene Candide.

In Murcia and Alicante there was a special group of caves which appeared to have had some contact with all the Neolithic groups so far referred to (Monte de la Barsella, La Pastora, etc.).

Sites, which by general consent were dated to Early Bronze Age times, were next examined in order to find out how much of the earlier Neolithic influence could be traced in them.

Downloaded from https://www.cambridge.org/core. University Frankfurt/Main, on 24 Feb 2018 at 15:14:22, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/S0003598X00036188

The two main sites were Los Millares and Vila Nova de S. Pedro.

Los Millares was a large, naturally-defended settlement site on a high promontory between two rivers in the present-day province of Almeria. Nearby was a cemetery of over seventy collective tombs. The settlement was defended by a stone-built wall which had bastions at regular intervals. There were complex devices for restricting and channelling the entrance to the settlement. It seems likely that there was also an inner defensive wall. A further defensive measure consisted of four small fortifications on the ridge of hills which bounded the site in the south-west. The graves were all collective tombs and most seem to have been corbelled. There were some, however, the construction of which suggested that they were probably to be regarded as 'round graves with passages'. During the 1955 excavations, it was noted that some graves had forecourts and often a cluster of baetyls or a scatter of pottery was found in them. A glance at the illustrations of the finds from these graves (G. and V. Leisner, 1943) showed that Neolithic features such as flat idols, trapezes, and green-stone beads, etc., were very rare at the site, and were found together in certain graves (e.g. grave 8). The majority of the finds from Los Millares could not be assigned to the Neolithic cultures nor could they be considered as belonging to the Beaker culture. The finds, in fact, consisted mainly of stone and bone containers, painted pottery, ivory and metal objects, baetyls or round idols, and symbol pottery. The distribution of these objects among the graves showed that there was a tendency for them to be found together, and very often in round graves with passages. A further study of the associated finds indicated that the phalanges, flint daggers, and deeply hollow-base arrowheads could also be included in this group. The graves containing objects typical of this group are: 7, 40, 9, 57, Loma de Huechar 2, 5, 8, 12, 15, 16, 23, 2, 25, 67, 10, 74, 41, 71, 21, 17, 32, 39 and 37. Thus at Los Millares it was possible to show that there was a certain assemblage of grave goods which cannot be related at all either to the earlier Neolithic cultures or to the later Bell Beaker culture.

A survey of the finds from the other sites in Almeria showed that, with the exception of Almizaraque, none of these sites had a typical Los Millares assemblage. Usually only isolated features typical of Los Millares were noted, and they occurred within a context more reminiscent of the Almeria culture (e.g. Loma del Belmonte 1; Llano de la Atalaya 3, 5 and 6, etc.). Almizaraque, a tell-like settlement site, situated in the Almanzora valley, yielded finds of a similar kind to those from Los Millares, and in addition a decorated stone sandal, many decorated long bones, and a pit which contained a bull burial (Cuadrado 1946). As at Los Millares there was also some slight evidence for contact with the Almeria culture (e.g. a flat idol and a stone bracelet, etc.).

In the neighbouring province of Granada, the position was even clearer, only a few objects typical of Los Millares were found in the graves there, and the characteristic grave goods were of Neolithic derivation.

The other main site, Vila Nova de S. Pedro, is situated near the village of the same name, about 9 km. north-west of Cartaxo, Ribatejo, in Portugal. This site is stoutly defended by three settlement walls, the two innermost of which are known to have bastions (Paço and Sangmeister 1956 and *Diario de Noticias*, Lisbon, 25 September, 1958). Recently three levels have been noted at the site. The earliest of these was found *under* the innermost defensive wall (here called the 'citadel') and consisted of a layer of earth which contained pottery decorated by stroke-burnishing (PLATES XXIV (*c*) and XXV). This pottery has sometimes been referred to in the publications as 'imported pottery'. The next level was represented by the citadel and its period of use. Both of these periods are called here for convenience V.N.S.P. I (Sangmeister (1956) refers to them as V.N.S.P. I and II*a*). There are signs that the wall had been destroyed, hastily reconstructed, and destroyed again;

PLATE XXV

EARLY BRONZE AGE COLONISTS IN IBERIA

Magnification of the stroke burnished pottery in PLATE XXIV(*c*) *to show the fineness of the technique. This is 'imported pottery' of the type found under the citadel wall, at Vila Nova de S. Pedro.*

See p. 194]

Downloaded from https://www.cambridge.org/core. University Frankfurt/Main, on 24 Feb 2018 at 15:14:22, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/S0003598X00036188

above this level of destruction abundant sherds of beaker ware have been found. This level is called V.N.S.P. II (II*b* of Sangmeister). As this distinction between V.N.S.P. I and II has only recently been noted, few of the finds can be attributed to either phase with any stratigraphical certainty. If, however, one dismisses the quantity of obviously beaker and later material there remains a group of finds which are similar to those known from Los Millares—stone and bone containers, round (or cylinder) idols, flint 'daggers', bifacially-worked arrowheads, and metal objects. To this list can be added the bone pins, which were replaced in beaker times by buttons, and the imported pottery and imitations of it, the statigraphical position of which indicates an early date. Very little trace of Neolithic influence could be seen at Vila Nova de S. Pedro; of over six thousand arrowheads found for example, only three were trapezes and none was leaf-shaped; and only about a dozen slate plaques have been found. The evidence is, however, sufficient to suggest that although Vila Nova de S. Pedro owed nothing to the local Neolithic cultures, those cultures were still in existence in the area.

An examination of the finds from thirty-eight sites in the area around the Tagus mouth, which included settlements, rock-cut tombs, corbel-vaulted tombs, caves and dolmens, yielded most interesting and instructive results. With the exception of the corbel-vaulted tombs, none of the sites showed an assemblage of finds typical only of V.N.S.P. I, but rather there were indications of a mixture of V.N.S.P. I features and features derived from the Neolithic cultures. For example, grave 3 at Palmela, besides cylinder idols, typical V.N.S.P. I arrowheads and metal objects, also contained decorated slate plaques, sixteen trapezes and some leaf-shaped arrowheads; or the dolmen of Monte Abraão contained imitation imported pottery, cylinder idols, and bone containers, as well as slate plaques, leaf-shaped arrowheads and a flat bone idol.

The study of finds from the Tagus region made it possible to establish the typical assemblage for the V.N.S.P. I phase, which was imported pottery and imitations of it (PLATE XXIV), certain exotic pottery objects such as spit-supports, stone and bone containers, stone cylinder idols, all cult objects such as stone lunulae, pinecones, mattocks, horns, sandals, etc., bone pins, flint daggers, hollow-base arrowheads (especially mitre and Eiffel tower type), and metal objects such as axes, chisels, and one-sided knives (these knives are quite distinct from Beaker knives).

It is clear then that both Los Millares and Vila Nova de S. Pedro do not represent a developed stage of the local Neolithic cultures because they show so little contact with the Neolithic; nor do they indicate a widespread invasion of the Peninsula by new cultures, because the assemblage of finds from these two sites differs from the typical assemblage of finds from contemporary sites in their immediate neighbourhood. In fact, they stand out as isolated settlements against a different cultural environment. There are a few other sites which by their finds must be included in this category. These are Almizaraque, Alcalá, with its corbel-vaulted tombs (G. and V. Leisner 1943), and Mesas de Asta (Esteve Guerrero 1945 and 1950). The last-named is situated in the swampy zone near the mouth of the Guadalquivir, and north-west of the town of Jerez. Below the Roman and Iberic remains at this site the excavator found Beaker ware, and also sherds of pattern-burnished and monochrome red or grey ware.

The similarity of finds at these colonies has been emphasized. It must be added, however, that there are regional variations. For example, painted pottery is commonest in South-East Spain, while pattern-burnished ware is found in South-West Spain at Mesas de Asta and Acebuchal, and stroke-burnished ware in the Tagus area. Stone and bone containers in Portugal are either completely plain or decorated by a variety of motifs, those of South-East Spain are usually decorated only by incised cross-hatching; bone pin

Downloaded from https://www.cambridge.org/core. University Frankfurt/Main, on 24 Feb 2018 at 15:14:22, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/S0003598X00036188

types are simple in South-East Spain and more varied in Portugal; stone cult objects are more common in Portugal, but phalanges, sometimes decorated, are more common in South-East Spain. These differences are, however, regional, and do not hide the basic similarities between the sites.

It has long been recognized that sites such as Los Millares have parallels in the Eastern Mediterranean, though these have not always been easy to trace. The available evidence for East Mediterranean contact is briefly examined below in order to show that these colonies, whose culture is quite different from that of the Neolithic in Southern Iberia, are in fact closely related to East Mediterranean areas. It should be noted that when references are given below to East Mediterranean sites they are not meant to be exhaustive, but rather are intended to give an indication of the possible areas involved in the setting up of colonies in the Iberian Peninsula. These parallels will be considered in roughly the following order: architecture, pottery, stone, bone and metal objects.

Among the most striking of recent discoveries in the Peninsula is the use of complex defensive systems at the colonies. Bastions, complicated entrances, multiple enclosure walls and outlying defences are all known. The Los Millares entrance is so unusual that parallels cannot yet be pointed out in the East Mediterranean area.

Sangmeister has already drawn attention to the similarity between the Los Millares settlement wall and a similar wall with bastions at Chalandriani in Syros (Paço and Sangmeister 1956, 229; Tsountas, 1899, fig. 32) and with the exception of some later Egyptian examples (Somers Clarke 1916) this is, in fact, the only site in the East Mediterranean where semi-circular bastions are known because elsewhere, bastions, if they occur, are rectangular (Blance 1957; Schachermeyr 1955, fig. 57; Lamb 1936, 24, 44, 210).

The use of multiple enclosure walls is also known at Chalandriani, and even the narrow entrance in the citadel wall at Vila Nova de S. Pedro can be paralleled at this site.

A few stretches of herring-bone walling were noted in both the settlement wall and the graves at Los Millares, and this technique is familiar at East Mediterranean sites such as Troy, Thermi, Haghios Kosmas and Eutresis (Lamb 1936, 15; Mylonas 1934, fig. 2; Goldman 1931, 15, fig. 12).

Knowledge of the Neolithic cultures of the Peninsula shows that this type of fortification cannot have evolved independently in the Peninsula, and the evidence cited above suggests that it came from the East Mediterranean. It is probable too that the ultimate origin of the towers of the Sardinian Nuraghe and of some sites in Mallorca should be traced back to this same tradition which arrived in the Peninsula in Early Bronze Age times.

A long-standing enigma is that of the corbel-vaulted tomb. What is its origin? Such tombs are not known in the Eastern Mediterranean before Mycenean times. Many unsuccessful attempts have been made to find exact parallels for the Iberian grave types, and here it is proposed only to show that certain features, common in the Iberian graves, can be paralleled in the East Mediterranean.

In the Peninsula, and particularly at Los Millares, the following features were noted in connection with 'corbel-vaulted' tombs: (*a*) probably not all were corbelled; (*b*) collective burial was practised; (*c*) offerings were made to the dead outside the graves, sometimes in a special niche; (*d*) the entrance to the graves was frequently constricted, usually by means of a port-hole slab; (*e*) the grave mound was often demarcated by stone slabs; (*f*) children were buried apart in niches (G. and V. Leisner 1943, 47, grave 20); (*g*) there was also a possibility that a grave of the Almeria culture had been used as a communal ossuary; (*h*) some rock-cut tombs were imitations of corbel-vaulted tombs.

Collective burial was known in the East from early times, when it was practised in

Downloaded from https://www.cambridge.org/core. University Frankfurt/Main, on 24 Feb 2018 at 15:14:22, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/S0003598X00036188

caves and rock shelters. Later these caves might be modified or enlarged for use as communal tombs, or certain houses might be set aside for use as communal ossuaries as, for example, in Gournia.

With regard to the various features noted in the Iberian graves the site of Haghios Kosmas is particularly interesting. There Mylonas found two types of graves, both of which had probably been used as ossuaries. One of these types had stone-built walls which inclined inwards giving them the appearance of primitive tholoi, and similar graves are known from Chalandriani in Syros (Mylonas 1934, 269; Tsountas 1899, figs. 5 and 10). The entrances to the graves at Haghios Kosmas were often very small and access must have been through the roof, and similar constriction of the entrance was noted in the Syros graves and at Krasi (Mylonas 1934, 268; Tsountas 1899, 83; and Marinatos 1929, 138). The area of the graves, too, at Haghios Kosmas, and also in Leukas, was often demarcated by a circle of stones (Mylonas 1934, 270, and Dörpfeld 1927, 207, 220). The custom of placing offerings for the dead outside the grave, often in a special niche, was a common practice at Haghios Kosmas, and was also noted in the Syros graves and in the Mesara tombs (Mylonas 1934, 271; Tsountas 1899, 80; Xanthoudides 1924, 51).

It is clear then that many individual features of the Iberian graves were also known in the East Mediterranean and it is not difficult to imagine that, owing to peculiar local conditions in South-East (?) Spain, the vaulted tomb, so typical of that area, arose.

A study of the pottery from the colonies is very interesting, and particularly the pottery from Mesas de Asta because, with the possible exception of El Acebuchal, it is the only site in the Peninsula which has yielded pattern-burnished ware.

In the Aegean, pattern-burnished ware is found in Neolithic and Early Bronze Age contexts. Mrs Ozanne (née Furness) considers that the pottery from Mesas de Asta is most closely paralleled in the material from Tigani in Samos, where pattern-burnished ware is characteristic of phase II. At Tigani, as at Mesas, both grey and brown pattern-burnished ware is found (the colours are most likely due to firing, rather than to any deliberate attempt to vary the colour); the pattern is frequently on the inside of the sherds, and the decorative motifs employed are also similar, with zones of cross-hatching occurring between completely burnished panels. Though this motif is fairly common in pattern-burnished ware, the cross-hatching at both Mesas and Tigani is noticeably elongated. At Tigani pattern-burnishing is found on deep open bowls. It is unfortunate that little information is available regarding the forms of this ware at Mesas, but open bowls must certainly have been represented there if the appearance of pattern-burnishing on the inside of the sherd is to be explained. A sherd from Orchomenos (Künze 1931, pl. IX, 3) has a plaited pattern-burnished design reminiscent of a sherd from Mesas.

Mrs Ozanne gives an excellent brief survey of the distribution of this type of pottery in the East Mediterranean (Furness 1956, 205–8). She was able to show that Tigani can be related to Besiktepe and Kumtepe I*a*. Phase I*c* at Kumtepe is contemporary with Troy I and thus Kumtepe I*a* and related sites must be earlier than Troy I. From her survey it is obvious that pattern-burnished ware is confined to the Neolithic period and is probably earlier than Troy I.

Red monochrome and highly burnished grey wares were also found at Mesas de Asta; it is not easy to point to immediate parallels in the East. Besides being known at Sesklo, red ware, in the form of bowls with rounded profiles or incurved rims, was found at Tigani. The paste was not good and was covered by a red slip which tended to flake away. The slip had been applied to the outside surfaces only of certain of the vessels or to the inside of open bowls (Furness 1956, 187). The strawberry-red colour of the slip on the Mesas ware is more like the Tigani material than the orange-red slip of the Sesklo material.

Downloaded from https://www.cambridge.org/core. University Frankfurt/Main, on 24 Feb 2018 at 15:14:22, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/S0003598X00036188

It was also noticed in the grey wares at Mesas that the burnishing was restricted to the visible surfaces only. There is, however, no parallel in the shape of the vessels at Mesas and Tigani. Red or grey monochrome ware is found in Asia Minor at sites such as Bujuk Gullucek (Kosay and Akok 1948), Alisar and Alaca. Lunate or horseshoe lugs which are found at Mesas de Asta are known on dark burnished wares from several sites in Asia Minor, and also from Tigani, Troy I, Dimini, and Sesklo (Furness 1956, 185).

In Lipari, monochrome red ware is characteristic of the late Neolithic Diana culture. Although the shades of red are slightly different at Mesas and Diana, and Diana pottery is also characterized by trumpet lugs, which are never found in Mesas, some of the forms in both areas are similar. It is interesting to notice that according to Brea, bifacially-worked arrowheads (apparently hollow-base type) arrived with the Diana culture (Brea 1951, 94) and that the first signs of metallurgy were also encountered in a Diana culture level (Brea and Cavalier 1956, 35). At Diana, the red ware is not associated with grey ware or pattern-burnished ware.

White, or light on dark, painted pottery was confined to South-East Spain, and it was applied to various shapes of pottery. The decorated motif used was most frequently the herring-bone pattern, which was arranged either vertically or horizontally. G. and V. Leisner (1943, 589) compared this pottery with white-painted pottery of the E.M. III period in Crete. This technique, however, was not confined to Crete but was comparatively widespread. A recent study of the distribution of white-painted pottery undertaken by Mellaart (1954, 194 ff., 202 ff.) shows a concentration of this ware at a number of new sites in South-West Anatolia. He suggests that there are two phases in the use of this pottery, the first was contemporary with Troy I and the second was during the E.H. III–E.M. III period.

Stroke-burnished ware (and imitations of it) is found only in the Tagus area. Although it is known from about fourteen sites, Vila Nova de S. Pedro has undoubtedly yielded the most important finds. The finest sherds are of a very high quality, especially in comparison with the local Neolithic pottery, and the grooves are very regularly and finely executed (PLATE XXV). The typical form is a cylindrical vessel with slightly convex base and concave sides (compare with a white-painted vase from Belmonte I, G. and V. Leisner 1943, 127, I, 14), but the simple bowl shape is also found. Decoration usually consists of three or four rows of horizontal grooves below the rim, and above the base, and the space between may be left plain or it may be decorated by fine herring-bone patterns, which have been lightly burnished into the surface of the vessel. Little is known about the use of stroke-burnishing in the East Mediterranean, but Sangmeister has already drawn attention to the resemblance between this pottery and the Cycladic pyxides (Paço and Sangmeister 1956, 222, footnote; Tsountas 1898, pl. 9, 18 and 31). In the Cyclades, herring-bone decoration occurs mainly on squat cylindrical or on taller jars, but the pattern always appears to be incised into the pottery, and it is never confined to the surface as in the Portuguese material (our PLATE XXIV (*c*), and Zervos 1957, figs. 81 and 82). The Portuguese material is, in fact, of better quality and craftsmanship than the Cycladic!

The burnished red colour of the Portuguese sherds, together with their form and decoration, suggest that both they and the Cycladic pottery may have originated in attempts to copy decorated metal objects such as the jug from Tomb B at Alaca Hüyük (Arik, R.O., 1937, CLXXI, 242), although, of course, this is too late to be directly connected with the Cycladic pottery.

In view of the other Cycladic connections noticed at Vila Nova de S. Pedro it is perhaps not unreasonable to consider that this pottery has also some relationship with the Cycladic pottery.

A mention must also be made of a pattern-burnished bowl from Aigina, which is remarkably like stroke-burnished vessels from Vila Nova de S. Pedro (Welter 1938, fig. 4, cf. Paço 1958, fig. 7).

Horned and plain cylindrical spit-supports were found at Vila Nova de S. Pedro (Jalhay and Paço 1945, XXI, fig. 7), but they are not known elsewhere in the Peninsula. Horned spit-supports, which are the more interesting of the two, were found at Asine, Troy, Thermi and in the Cyclades, while cylindrical ones with horizontal perforations are known from Olynthus, Eutresis, Rakhmani, Gozlu Kule, and Kusura (Frodin and Person, 1938, 232–3, No. 169–7; Sjövall, 1925, 185; Blegen *et al.*, vol. 1, fig. 369, 38–102; Lamb, 1936, fig. 44, 30, 6; Mylonas 1929, fig. 89*a*; Goldman, 1931, No. 266–4, 193; Wace and Thompson, 1912, 43, fig. 19; Goldman, 1956, 324, Nos. 16–21; Lamb, 1937, fig. 16, 4–6).

Stone containers which first appear in the Peninsula at this time are well known features of East Mediterranean cultures and the bone containers appear by their form and decoration to be closely related to them. There are a few instances of pottery imitations of stone vessels. Small pottery vessels with three or more mouths may be imitations of small stone vases of a type found in great numbers in the Cretan Tholoi (Xanthoudides 1924, pl. x). A few zoomorphic vases of stone or pottery are also known in the Peninsula.

While simple pin-types were found throughout Southern Spain, finds of vase and bird-headed pins were confined to the Tagus area. Sangmeister has already drawn attention to their similarity with the bird-headed pins from Syros (Paço and Sangmeister 1956, 225, fn. 13, and Tsountas 1899, pl. 10, 13), and there is also a vase-headed pin from this site *ibid.*, pl. 10, 14). Vase-headed pins and similar types are also known from early levels at Eutresis, Thermi, Troy, Alisar Hüyük and Gozlu Kule (Goldman 1931, fig. 284, Nos. 5, 7; Lamb 1936, 167; Blegen *et al.*, 1950, No. 37, 615; Van der Osten 1937, vol. I, fig. 196*c*, 2142; Goldman 1956, 313, fig. 438, Nos. 50, 51, 54).

The bone or ivory combs which have been found at several sites in the Peninsula are too simple to be able to show immediate East Mediterranean parallels.

The evidence suggests that the colonists introduced the knowledge of metal-working into the Peninsula and this included knowledge of casting in a closed mould (e.g. the Alcalá daggers). This is important because the succeeding Beaker phase used only hammered metal and heavy cast objects, such as axes, are not known in any Beaker assemblage.

The Alcalá dagger type with its bifacial mid-ribs is a general East Mediterranean type and similar dagger forms are known in the Cyclades, Crete, Lemnos, etc. (Xanthoudides 1924, pls. XXIV and XXIX; Zervos 1956, figs. 290–292; Brea 1959, fig. 8). It is also suggested that some of the flint daggers and halberds so common in Southern Spain during this period may be imitations of some East Mediterranean dagger types such as those from Haghia Triada in Crete.

The axe type, typical of the colonies, is long with almost parallel sides and a lightly splayed cutting edge. Such axes are a common early type in many areas of the Eastern Mediterranean, and are often regarded as of Anatolian origin (Tsountas 1898, pl. 12, 7; Goldman 1931, fig. 286, 2; Brea 1959, fig. 9; Lamb 1936; Kosay 1944; Van der Osten 1937, 197, e 480, d 1877, c 2477; Kosay and Akok 1948, pl. XCIX; Goldman 1956, 289; Lamb 1937, fig. 19, 1; Daux, 1959).

At Eutresis, in Boetia, a curved knife and a metal seal found there may be compared to similar objects from Vila Nova de S. Pedro and Monte do Cabeço dolmen (Paço and Sangmeister, 1955; the Leisners, 1959, pl. 16, 1, 1).

Mention must also be made of a painting, which could be interpreted as a ship with a high prow and stern and many oars, on an upright stone in the dolmen of Antelas, near Aviero (Albuquerque, Veiga Ferreira and Viana, 1957).

Downloaded from https://www.cambridge.org/core. University Frankfurt/Main, on 24 Feb 2018 at 15:14:22, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/S0003598X00036188

There can be no doubt that, despite regional differences, some of which may be due to the difference between grave and settlement finds, there is a remarkable uniformity between the main colonial sites, Los Millares, Almizaraque, Alcalá and Vila Nova de S. Pedro. Some of the differences may be due to the fact that each colony had a different source in the Eastern Mediterranean. Other differences may have developed as the colonies became cut off from their motherland and also, possibly, from one another. Thus the use of criss-cross decoration on the bone containers of South-East Spain may be an early feature, since this motif is known from early objects, such as the ivory sandal in Los Millares 7 and the ivory comb in Marcella. The variety of design on the bone containers in the West may, on the other hand, have been a later, local development. Differences, such as the presence or absence of spit-supports, vase-headed pins, or white-painted pottery, are more likely to be the result of different East Mediterranean sources. The influence of the Cyclades, the West Anatolian Islands and Anatolia is clearly suggested by the study of the finds. It would probably be wrong to regard any one of these areas as being responsible for the planting of all the colonies in the Iberian Peninsula, and it is likely that each of the main sites in the Peninsula was colonized from a different area in the Eastern Mediterranean.

Vila Nova de S. Pedro, which was shown to have several links with the Cyclades, must belong to a period when herring-bone design was still popular there and before the typical Cycladic spiral pattern had been developed. This implies a time before the E.C. II period which is usually dated about 2400 B.C. (Matz, 1950).

Mesas de Asta shows little contact with the other colonies and the find of pattern-burnished ware makes it probable that it is of an earlier period. If the parallel with Tigani in Samos, the dating of which depends on the date of Troy I (*c.* 2700 B.C.) is correct, the site must be dated about 2700–2600 B.C. This date would coincide approximately with the arrival of flat idols, etc., in Almeria.

The East Mediterranean parallels to Los Millares are less easy to trace to one particular area, but there are obvious contacts with the Cyclades and, of course, the earlier Almeria culture was characterized by Cycladic type idols. A sample of carbon, found *below the tumble* of the settlement wall at Los Millares, was dated by carbon 14 to 2345 ± 85 B.C. (Schwabedissen and Otto, 1958, 142), and this date agrees well with the one suggested above for Vila Nova de S. Pedro. Sangmeister (1956, 229) also obtained a similar date for the beginning of Los Millares and Vila Nova de S. Pedro.

It is interesting that the Iberian relationships are with the Cycladic and West Anatolian areas, where sailing would have developed of necessity, and the inhabitants would be capable of undertaking long sea voyages, such as the route to Spain. It is, at first sight, surprising that this phase is not so evident in Sicily, Lipari, or Malta. This may be due to the fact that the colonists preferred to sail along the continuous coastline of the South Mediterranean, or they may have feared the risk of piracy on the part of the islanders.

It is permissible to conclude that the evidence available indicates that during the Early Bronze Age in the Peninsula there appears a group of sites which cannot be directly related to the earlier Neolithic cultures. These sites do, however, show close contact with the Eastern Mediterranean, and particularly with the Cyclades and Western Anatolia. The earliest of these sites is probably Mesas de Asta (*c.* 2700–2600 B.C.) and it is possible that the foreign elements in the Almeria culture, which is earlier than Los Millares I, also arrived about this time. Vila Nova de S. Pedro and Los Millares were founded later and they can both be dated to before 2400 B.C. It is suggested that later, when contact with the homeland ceased, these colonies developed local characteristics. There was probably more contact between them and the Neolithic inhabitants, who had already been influenced by the colonists even to the extent of imitating among other things their pottery and their

Downloaded from https://www.cambridge.org/core. University Frankfurt/Main, on 24 Feb 2018 at 15:14:22, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/S0003598X00036188

building achievements. The fusion of these two groups may well be behind the origin of the beaker culture, which in time overthrew the colonies, whether by destruction or domination, so that by Argaric times little evidence of this golden age in Iberian prehistory remains.

APPENDIX

The following sites in Southern Iberia have *bastions*: Los Millares, walls of settlement and of fort (Santa Fe de Mondujar, Almeria, Spain); Campos, a house (Cuevas de Vera, Almeria, Spain); Vila Nova de S. Pedro, in at least two of the settlement walls (Cartaxo, Ribatejo, Portugal); and (?) Zambujal, walls of settlement (near Torres Vedras, Estremadura, Portugal).

The following sites in Portugal have yielded *imported pottery* either true or imitation: Castro de Chibannes, Palmela; Licea, Barcarena; Pedra de Ouro, Alenquer; S. Mamede, Obidos; Quinta do Anjo, Palmela; Alapraia, S. João de Estoril; Carenque, Belas; Monge, Serra de Sintra; Agualva, Caçem; Monte Abraão, Belas; Samarra, Acafora, Sintra; Arruda II, Freiria, Torres Vedras; Poço Velho, Cascais; Cova da Moura, Torres Vedras; Vila Nova de S. Pedro, Cartaxo, Ribatejo; S. Pedro de Estoril, Estoril; Parcede, Estoril; Gruta de Carvalhal, Turquel, Obidos; Cartaxo, Vila de S. Pedro.

PHOENICIANS AT HOME
PHOENICIANS ABROAD [1]

John D. GRAINGER, *Hellenistic Phoenicia* (Oxford, Clarendon Press, 1991). I-IX, pp. 228. 7 maps. U.S.$ 60.00. ISBN 0-19-814770-8.

There has been something of a renaissance in Phoenician studies in the past several decades, but one would not be aware of that after reading John Grainger's new book. Perhaps the most spectacular and comprehensive publication of recent years was the massive tome *I Fenici* [2] developed from a sumptuous and well-received exhibition of Phoeniciana at the Palazzo Grassi in Venice in 1988. The popular journals *Archaeology* and *Dossiers Histoire et Archéologie* devoted portions or all of recent issues to the Phoenicians, as did the more scholarly *Bulletin of the American Schools of Oriental Research* [3].

1. Grateful acknowledgement is made to John Pairman Brown who provided much helpful criticism of an earlier draft and to whom I turned for the benefit of much wisdom on fundamental aspects of Phoenician history. Thanks also to the editors of *Topoi* for several useful suggestions. Any remaining errors are my responsibility.

2. S. Moscati (ed.) *I Fenici* (Milano, 1988). The volume runs to nearly 800 pages and is lavishly illustrated (often with color plates). It was published simultaneously with French, German, Spanish and English translations. The contributors are among the most eminent scholars in the field. See (e.g.) the review by S. Segert in *JAOS*, 111 (1991), p. 811-14.

3. *Archaeology*, p. 43 (Mar./Apr. 1990), p. 22-35. Under the heading « Special Section : The Phoenicians » are articles on Phoenician trade and artistry, with brief glimpses at

French and Belgian publications on aspects of Phoenician history and culture are especially abundant in the past twenty years. Notable broader studies are Michel Gras, Pierre Rouillard, and Javier Teixidor *L'Univers phénicien* (Paris, 1989) and Guy Bunnens, *L'expansion phénicienne en Méditerranée* (Bruxelles, 1979). Maurice Saliba's *Index Libanicus* (Jouniah [Lebanon], 1979 ; new ed. planned), while a bibliography of sources for *all* historical periods, nevertheless contains many useful references for the classical age. These are among the most prominent of the works not mentioned by the author, who relegated his bibliography to the footnotes.

Mention should be made of other important publications, some utilized by Grainger and others too recent for him to acknowledge. Fundamental to any study of the Hellenistic period is Édouard Will's two-volume *Histoire politique du monde hellénistique (323-30 av. J.-C.)* (2nd ed. Nancy, 1979-82). As far as I can tell it was consulted only twice (60 note 28 ; 83 note 106). I found no reference at all to A. Bouché-Leclercq, *Histoire des Séleucides (323-64 avant J.-C.)* (Paris, 1913), still serviceable despite its eighty years. The Belgian series *Studia Phoenicia*, ongoing since 1983, is now at volume XI : *Phoenicia and the Bible*. [4] Closely related to that is the monograph by F. Briquel-Chatonnet, *Les relations entre les cités de la côte phénicienne et les royaumes d'Israël et de Juda* (Leuven, 1991) [5]. Single-city studies now include a thorough appraisal of Sidon in the Achaemenid period by Josette Elayi, *Sidon : Cité autonome de l'Empire perse* (Paris, 1990) which Grainger utilized, and Hassan Sarkis' « Histoire de Tripoli (des origines à l'occupation franque) » [6], which he did not.

The entire issue of Phoenician origins has been reviewed with admirable clarity and conciseness by Jean-François Salles, « Les Phéniciens de la Mer Erythrée » [7]. This should serve as the needed catalyst for an open discussion of a vexed issue. Salles has also surveyed a broader field of history in a review article entitled « Du Bon et du Mauvais Usage des Phéniciens » [8]. Thorough

---

international relations and the Phoenician pantheon. The entire issue (# 132, November, 1988) of *Dossiers* was devoted to the Phoenicians under the title « Les Phéniciens à la conquête de la Méditerranée ». *BASOR*, 279 (1990) includes articles on Levantine geopolitics in the early Iron Age, as well as contributions on Phoenician art, ceramics and religion, and a select bibliography of « suggested readings » on Phoenician history and culture *c.* 1935-1988. See also the section entitled « Les Phéniciens » in *Archeologia*, 146 (Sept. 1980), p. 6-37.

studies of Phoenician coinage and economic affairs are the theme of Tony Hackens (ed.), *Phoenician and Punic Numismatics and Economic History* (Louvain-la-Neuve, 1988) [9]. The long-awaited *Manuel d'Études Phéniciennes et Puniques* is still in press [10]. The *Anchor Bible Dictionary* (New York, 1992) has just appeared in six volumes [11]. We are fortunate to have the speedy publication of a preliminary report by Gioacchino Falsone, « Third International Congress of Phoenician and Punic Studies (Tunis, Nov. 11-16, 1991) » [12].

Hellenistic Phoenicia is introduced by discussing the term « Phoenicia » with all the geographical and political connotations which that expression entails, and the chronological parameters to which the author will adhere. We are offered at the beginning only general apologias for the book : « The absence of an ancient account of Phoenician history... cannot be a reasonable excuse for failing to study the subject » (p. 1), and (more to the point) the claim (2) that « this [is] the first modern study of the Hellenistic period in Phoenicia ». Much later, when introducing the final chapter, Grainger adds in a parenthetical way that « ...one of the objects of this book is to emancipate the Phoenicians of the Hellenistic period... » (187).

We are not told from what constraints this emancipation will be effected. Simple obscurity may be implied. Even such a catholic scholar as Arnaldo Momigliano [13] pleaded lack of information for exclusion of the Phoenicians (i.e. Carthaginians) in his study of non-Greek cultures of the Hellenistic Mediterranean. Momigliano failed completely to address the Phoenicians of the Levant. Cultural deprivation, however, seems to be G.'s concern : « Their [the

9. Perhaps best read in conjunction with B. TRELL, « The Coins of the Phoenician World-East and West » in W. Heckel & R. Sullivan (eds.), *Ancient Coins of the Graeco-Roman World : The Nickle Numismatic Papers* (Calgary, 1984), p. 117-39.

11. Many of the *ABD*'s entries are specifically or tangentially relevant to Phoenician studies, but of the Iron Age and Persian period *only*. See in particular Brian PECKHAM's « History of Phoenicia », *ABD*, 5, p. 349-57 and Philip C. SCHMITZ, « Phoenician Religion », *ibid.*, p. 359-63.

12. *Berytus*, 38 (1990), p. 185-190.

13. *Alien Wisdom : The Limits of Hellenization* (London, 1975), p. 4 ; 6 : « I would gladly talk about the ideas of the Carthaginians, if we only knew them... [u]nfortunately there is not enough evidence to make a coherent account of how Carthaginians and Greeks saw each other in the third and second centuries B. C..... ». This is the minimalist view. The evidence is indeed fragmentary, but hardly nonexistent. Philip Hitti, overzealous and nationalistic in his treatment of the Phoenicians, nevertheless provided a useful glimpse at Greek-Phoenician relations in the Hellenistic era ; see his *Lebanon in History* (2nd ed., London, 1962), Chap. XI « Alexander and His Successors », p. 159-73 ; Chap. XII « Economic and Cultural Aspects : Hellenization », p. 174-84.

Phoenicians'] cultural heritage was... surely mutilated [by the ravages of war] beyond repair, leaving an impoverishment which Greek culture could hope to fill » (50) [14]. This is a a modern echo of the ancient condescension expressed in the famous exchange between Jesus and the Syro-Phoenician woman in *Mk.* 7 : 24-31 and parallels [15]. While G. appears to relegate the Phoenicians to the rôle of victims of cultural imperialism, the evangelists imply Phoenician acceptance of religious exclusion (vis à vis the Jews of Palestine) except for the enlightened few. Either assumption is baseless. Zeno of Citium, a Cypro-Phoenician of Sidonian ancestry [16], bequeathed to the Hellenistic world the principles of Stoicism, the most ethically demanding and widely influential philosophical system of classical antiquity. That it was transmitted (as were the Gospels) through the Greek language, or that it embodies (as does the Pauline correspondence) certain elements of prior Hellenic thought, should not obscure the Semitic identity of its articulator [17].

Phoenicia produced more than its share of innovative and seminal thinkers from the Hellenistic period through late antiquity [18]. G. is right to note (79 ; 110)

---

14. Here G. agrees with Momigliano's pessimistic view : « Carthaginian culture... did not decline : it was murdered by the Romans... » *Alien Wisdom*, p. 4. But we have Augustine's word for it that Carthaginian culture was still a viable factor in his own day : *Unde interrogati rustici nostri quid sint, punice respondentes Chanani...* (*PL* Vol. 35 : 2096). As long as a language lives in its spoken form, so lives the culture it embodies.

15. T.A. Burkill has devoted much attention to this vignette ; see « The Syrophoenician Woman : The Congruence of Mark 7 : 24-31, *ZDNW*, 57 (1966), p. 23-37 ; *idem*, « Mark 6 : 31-8 : 26 : The Context of the Story of the Syro-Phoenician Woman » in L. Wallach (ed.), *The Classical Tradition : Literary and Historical Studies in Honor of Harry Caplan* (Ithaca, U.S.A., 1966), p. 329-44 ; *idem*, « The Historical Development of the Story of the Syrophoenician Woman », *NT*, 9 (1967), p. 161-77.

16. The relevant sources on Zeno's ethnic identity and his association with Sidon are noted in W.W. TARN & G.T. GRIFFITH, *Hellenistic Civilisation* (3rd ed., London, 1966), p. 330 and note 1. Grainger (79) judges this evidence as « poor » but leaves the question open. « Cypro-Phoenician » is a term used by Hitti, *Lebanon in History*, p. 180. It has the same bi-cultural sense as « Syro-Phoenician » in the Gospel of Mark and « Libo-Phoenician » of other classical sources. Citium had a tri-cultural ambiance throughout the Hellenistic period, though G. seems ambivalent about this. On p. 9 he refers to it as « a sixth Phoenician city... partly Cypriot, partly Greek in population, but also with an ancient Phoenician participation... » but on p. 22 he states that « Kition was basically a non-Phoenician city... ».

17. On the impact of Stoicism see the magisterial treatment by Marcia COLISH, *The Stoic Tradition from Antiquity to the Early Middle Ages.* Vol. 1 : *Stoicism in Classical Antiquity.* Vol. 2 : *Stoicism in Christian Latin Thought through the Sixth Century* (Leiden, 1985). Not surprisingly most of the known Phoenician or Graeco-Phoenician philosophers were Stoics : « Stoicism from the outset proved congenial to the Semitic conception of life » (Hitti, *Lebanon in History* 180).

18. On this see C. VIROLLEAUD, « Littérature Phénicienne » in R. Queneau (ed.), *Histoire des Littératures I* (Paris, 1955), p. 277-91. Strabo (*Geog.* 16.2.24) notes that the atomic

that there are « no [Phoenician] historians, poets or playwrights » known to us from the third century. But Sidon produced two philosophers (Zeno and Boethius) and a poet (Antipatros) in the second century, and Tyre attracted the hellenophile Syrian poet/philosopher Meleager of Gadara in the early first century. It is only academic racists of the stripe described by Martin Bernal [19] who would deny the influence of Phoenician thought on the Graeco-Roman world. Perhaps the most extreme view was that of George Rawlinson who a century ago summarized the quality of Phoenician literature on the basis of the extant fragments of Philo of Byblos' *Phoenician History* :

> « ...the literary value of Philo's work was exceedingly small. His style is complicated and confused ; his matter, for the most part, worthless, and his mixture of Greek, Phoenician, and Egyptian etymologies absurd. If we were bound to believe that he translated a real Phoenician original, and that the original was a fair specimen of Phoenician literary talent, the only conclusion to which we could come would be, that the literature of the nation was beneath contempt » [20].

G. does make it clear on p. 2 that the main thrust of *Hellenistic Phoenicia* is the *political* history of the coastal city-states, for which he relies heavily upon numismatic evidence. Within that « framework » two main « themes » are identified : trade and Hellenization. This means, unfortunately, that the *indigenous* cultural aspects (language, art, architecture, religion) of Phoenician civilization are largely ignored. This seems particularly odd given the intense interest in nationalism expressed by Near Easterners generally and reflected in extant Hellenistic literature and citations in later authors [21]. While the Phoenicians at home struggled to maintain some political equilibrium amidst the shifting sands of contending Macedonian dynasties, Phoenicians abroad were

---

theory associated with Democritus « originated with Moschus the Sidonian, of the Trojan [War] era ». On a common Graeco-Phoenician motif of one-eyed monsters (e.g. *Odyssey* Bk. 9) see T. POLJAKOV, « A Phoenician Ancestor of the Cyclops », *ZPE*, 53 (1983), p. 95-8 and the literature cited at p. 95 note 3.

19. M. BERNAL, *Black Athena : The Afroasiatic Roots of Classical Civilization. Vol. I : The Fabrication of Ancient Greece 1785-1985* (New Brunswick, 1987) *passim.*

20. G. RAWLINSON, *History of Phoenicia* (London & New York, 1889), p. 388-9.

either active participants in Carthage's three great struggles with Rome, or were passive spectators of that drama.

It may have been precisely those internal and external forces acting upon a culture acutely aware of its antiquity and value which led to the preparation of the first coherent account of Phoenician history. Philo of Byblos, though a writer of the middle Antonine period, drew upon an earlier Phoenician source for his *Phoenician History* [22]. Recent studies of the extant fragments of Philo [23] indicate that his source, which he himself identified as a chronicler named Sanchuniathon and claimed to be of the Trojan War era, was of Hellenistic rather than Homeric date. Sanchuniathon [24] will have been an historical personage, perhaps the Manetho of Phoenicia but lacking either the ability or the desire to render his compendium of Phoenician culture into Greek.

G. sets the geographical limits at Aradus (Ruad) island in the north and Ptolemais (Acre) in the south, with some attention given to Phoenician settlements (notably Citium) in southern Cyprus. The Phoenician interior is ignored save for the references in Polybius to the military campaigns of Antiochus III [25], and the later emergence of the Ituraean kingdom. The chronological parameters are *c.*360 - 15 B. C. *Hellenistic Phoenicia* comprises seven chapters, all except the last governed by political events. Thus we have « Time of Troubles (360-287) », « Ptolemaic Peace (287-225) », « Conquest (225-193) », « Seleukid [*sic*) Peace (193-129) », « Autonomy and Independence (129-64) » and « Roman Takeover (64-15) ». Chapter 7, « Phoenicians

22. For a more judicious appraisal of it than that of Rawlinson (quotation above) see P. NAUTIN, « La valeur documentaire de *l'Histoire Phénicienne* », *RB*, 56 (1949), p. 573-8.

23. Apart from the reference at p. 50 n. 176, Grainger seems unaware of the state of recent literature on Philo of Byblos : see J. BARR, « Philo of Byblos and his "Phoenician History" », *BJRL*, 57 (1974), p. 17-68 ; J. EBACH *Weltentsehung und Kulturentwicklung bei Philo von Byblos* (Stuttgart, 1979) ; M.J. EDWARDS, « Philo or Sanchuniathon ? A Phoenicean [sic] Cosmogony », *CQ*, 41 (1991), p. 213-19. A major fault of several of these studies is their proclivity to discuss the extant fragments of the *Phoenician History* as if they had a complete and coherent text in front of them. On the Hellenistic date of Sanchuniathon see especially R.A. ODEN, « Philo of Byblos and Hellenistic Historiography », *PEQ*, 110 (1978), p. 115-26 ; A.I. BAUMGARTEN, *The Phoenician History of Philo of Byblos : A Commentary* (Leiden, 1981) ; H.W. ATTRIDGE & R.A. ODEN, *Philo of Byblos, The Phoenician History : Introduction, Critical Text, Translation, Notes* (Washington, D.C., 1981). For earlier studies see the bibliographies in the works just cited and J.P. BROWN, « Kothar, Kinyras, and Kythereia », *JSS*, 10 (1965), p. 202 note 1.

24. *Sanchuniathon* was long ago attested as a Phoenician name (i.e. *Sknytn*) ; see M. LIDZBARSKI, *Handbuch der nordsemitischen Epigraphik*, Vol. I (Weimar, 1898 ; reprint Hildescheim, 1962), p. 482.

25. G.'s account (90-93) of this campaign would have benefitted greatly from J.-P. REY-COQUAIS, « Notes de géographie syrienne antique », *MUSJ*, 40 (1964) 287-312 esp. p. 289-296.

Oversees », is a curious catchall, heavy on epigraphy (albeit only Greek and Latin) and regrettably scanty on archaeology. Throughout the book much is made of Phoenician-Greek cultural contacts, but except for some fleeting references to relations with the Hasmonaeans and Herodians of Palestine there is no contact indicated between the Phoenicians and any other Semitic people [26] !

G.'s Graecized rendering of some proper names and place-names is something of an affectation (e. g. Kleopatra, Dareios, Baktria, Kilikia), and several (e. g. Iannaios for Jannaeus ; Karrhai for Carrhae ; Kyros for Cyrus ; Kassandros for Cassander) are particularly annoying. « Ake » is an awkward rendering of either « Akko » or « Acre ». Seleukid for Seleucid, which G. preferred in earlier works [27], is an incorrect spelling of the adjectival form which I believe was introduced (in English) some thirty years ago by Samuel Eddy [28]. It is time to end the use of this *grammatoid*. Typographical errors are frequent, e. g. on p. 77 line 4 read « contemplate » ; p. 84 second line from bottom, insert « be » between « would » and « no » ; p. 122 third line from bottom read « through » ; p. 176, six lines from top, read « Actium ». In several places the index cites *blank* pages for information ; see (e. g.) the entry for « Ituraeans » on p. 224 where a « filler-page » (p. 158) is cited twice. The town of Abila (of Lysanias) is incorrectly located in the southern Biqâ` Valley on p. 113, but correctly placed east of the Anti-Lebanon Mountains (in the Abilenê of *Luke* 3 :1) at p. 150.

We are left wondering what editor(s) missed muddled sentences such as « This [the minting of coins at Aradus in 212 B. C.] seems to be too coincidental to be a mere coincidence » (98) or « this time the king [Azemelek] was helpless to resist public opinion ; but he also survived, this time » (37) and « There is no reason to believe he [Attalus] left any men or ships in Tyre when he left » (40). We are also presented with tendentious value judgements such as « ...even to a hardened nomad it is better to farm for food than to herd goats in the desert » (115) and « Phoenician traders and travellers... had a much easier linguistic time of it than... the cuneiform-writing Babylonians, or the syllabic-writing Egyptians, or the barely literate Iranians » (191). Hyperbole is well-served by statements on the order of « The presence of huge Roman armies in Syria, usually in the north but lungeing [sic] into Palestine every now and again,

---

26. G.'s statement (145) that Tyrians and Hasmonaeans forged a common bond *c.* 104 B. C. because the two « ...were self-consciously Semitic » implies that the concept of Semitism was understood in antiquity. There is no evidence whatever for that. The bond between them was their Hellenophobia, an observation I owe to J.P. Brown.

27. J. GRAINGER, *The Cities of Seleukid Syria* (Oxford, 1989) ; ID, *Seleukos Nikator : Constructing a Hellenistic Kingdom* (London & New York, 1990).

28. S.K. EDDY, *The King is Dead : Studies in the Near Eastern Resistance to Hellenism* (Lincoln, U.S.A., 1961), *passim*. The spelling of « Seleukid » in the reference (136 note 13) to a 1938 article by E.T. Newell is Grainger's rendering, not the author's.

would persuade any Syrian prince to keep his head down and pay up like a man » (163).

There are also erroneous statements such as « Phoenician was an Aramaic dialect » (191) and a reference to the Ituraeans « ...who were at times regarded as Arabs, presumably because of the language they spoke » (19) [29]. The latter two semantic gaffes highlight G.'s apparent ignorance of the Phoenician language in particular, and of other Semitic languages in general. This is evident elsewhere in the book by his use of the *CIS* rather than the more appropriate *KAI* [30], or his use of translations from other standard sources (e. g. *ANET*).

On p. 155 and again on p. 160 G. ascribes the name « Kinyras » to the Ituraean *tyrannos* of Byblos *c.* 65 B. C. on the basis of the text of Strabo (*Geog.* 16.2.18.) « Kinyras the Ituraean » is an enduring historical *factoid*, perpetrated by « modern historians who are not also, like Strabo, mythographers » [31]. Strabo's reference is to the Homeric Kinyras of Cyprus (*Iliad* 11. 20) from whom Agamemnon received the gift of a corselet. Strabo the antiquarian is here simply concerned to alert his readers to the fact that « Byblos, the *basileion* of Kinyras, is sacred to [the god] Adonis ». Strabo adds that the Ituraean tyrant of Byblos, whom he does *not* name, was ultimately beheaded by Pompey during the Roman occupation of Phoenicia.

The maps average one per chapter and are minimally useful. That of « Greater Phoenicia » omits any inland sites except for several places in Cyprus. The map of « Akhaimenid Phoenicia » omits the sacred precinct of Eshmun near Sidon, the one site of southern Phoenicia with a strong Persian element in architecture and decorative motifs. Several other sites mentioned in the text do not appear on any map. « Phoenicia in the First Century B. C. ». misleadingly depicts the Ituraean Arabs controlling about 70% of Phoenician territory. For comments on the map labled « Phoenicians in the West » see below. The reader would do well to consult instead the splendid series of historical maps in Ulrich Kahrstedt's *Syrische Territorien in Hellenistischer Zeit* [32].

There are several all-too-brief references to Phoenician deities or religious shrines, some of which need clarification. G. correctly identifies (14 and *passim*) Melqart as the special god of Tyre without noting that to date only one

29. On pp. 74-5 G. cites a papyrus from Hermoupolis in Egypt as being written « in Phoenician » when the editor of that document, J.T. Milik, refers to it as « araméen ». Greek historians of the period would identify the Ituraeans as Arabs by cultural traits *other than* language. I owe these observations to J.P. Brown.

31. John Pairman Brown in a letter to me of 14 August 1992. See his « Kothar, Kinyras and Kythereia », p. 205 note 4. I am indebted to the author for bringing that article to my attention.

32. (Berlin, 1926). See in particular maps Ib (« Phoinikien um 340 ») ; IIa (« Die Emanzipation der *Poleis* ») ; IIIa (« Syrien bei dem Eingreifen des Pompeius ») ; IIIb (« Syrien nach Pompeius »).

Phoenician grafitto [33] gives that explicit connection. It reads *LMLQRT BSR* : « To Melqart in Tyre (Sur) ». Ba`al Shamin is taken (16) to be the god of Baitokaike, the inland shrine of Arados. This is still conjectural and should be so stated [34]. The shrine to Eshmun/Aesclepius is said (16) to be on the Nahr Barouq when in fact the site is on the Nahr Awali. Non-Phoenician deities also get short shrift. The evidence for Isis-worship at Kharayab near the mouth of the Litani is noted (69 ; 77). G. sees this as an « attempt to attract the attention of Greeks out of Egypt » but his reasoning here is not at all clear.

In his survey of the Phoenician cities just prior to the Macedonian conquest G. stresses the amount of rebuilding (on the basis of historical reports, not archaeological data) undertaken by certain of them with no reference to the possibility of earthquake damage, rather than hostilities, as a destructive factor in their history. An earthquake catalogue for the Phoenician coast was called for a generation ago by John Pairman Brown [35]. G. then laments (14-15) that the urban plans of Phoenician cities are impossible to recover. City plans of the Persian or Hellenistic period *are* notoriously difficult to ascertain without extraordinary circumstances such as those obtaining at (e. g.) Ai Khannum in northern Afghanistan and Olynthus in northeastern Greece. But complete pessimism is unwarranted.

Père Sauvaget [36] long ago demonstrated that modern maps and photos display important topographical features of earlier periods of continuously inhabited cities. Since those modest beginnings some important studies have been published or are in progress. Note a recent statement regarding ancient Beirut : « ...[early] maps are thus historical source-material of prime importance, as they illustrate the urban physiognomy of the city before its rapid expansion towards the end of the 19th century before the demolition of its defences and the beginning of its urban sprawl » [37].

Prof. Oleg Grabar of the Institute for Advanced Study (Princeton, U.S.A.) has projected a study of the topography of Byzantine, Islamic and Ottoman Jerusalem [38]. Fundamental to his research are the detailed maps created by the Palestine Exploration Fund between 1865 and 1880, and excellent photographs of

38. A seminar entitled « Jerusalem Past and Present » was held at the I.A.S. on 7 November 1992.

the city dating to the 1850s. Thus we may hope that such optimism is not unwarranted. It is especially unfortunate that the excavations of Sarepta (near Sidon) and Tell Arqa (near Tripoli) were interrupted by the conflict in Lebanon, since those uninhabited sites made it possible for the excavators to anticipate clearing large sections and exposing the urban plan of several periods in each city's history.

What does seem clear is that some Phoenician cities enjoyed a mutually beneficial relationship with their Persian overlords during the two centuries of Achaemenid rule. Amélie Kuhrt [39] has stressed the need for modern historians to guard against over-reliance on Greek sources and the Old Testament. G. contrasts the evidence from elsewhere by stating « ...[i]n the rest of the Levant the cities had died, repeatedly devastated and depopulated by earlier conquerors » (18). But the evidence for this comes largely from the historical sources, especially Diodorus Siculus, who wrote late in the first century B. C. G. takes him to task (25) for suggesting, as he does, that a « common-council » was held at Tripolis. That city was, of course, a tripartite creation in the late fifth century, a joint venture by Arados, Sidon and Tyre. The council there may be related only to the internal arrangements of that city-state. Certainly Phoenicians abroad met in assemblies, for we have epigraphic evidence to that effect [40]. But G. is perhaps right not to extrapolate a « federation » or « federal league » at Tripolis from that external evidence.

Diodorus is similarly castigated by G. (27-8) for first offering an « unsatisfactory account » and a « confused » presentation of events leading up to Artaxerxes III's attack on Sidon (351 B. C.) and then writing a « lucidly clear description of the siege itself ». G. makes no allowance that Diodorus' own sources may have been of very uneven quality. Is the result, as G. claims, a « literary composition » with common *topoi* utilized ? Hieronymus of Cardia's account of Nabataean origins, used by Diodorus during a description of an attack on the Nabataean capital of Petra in 312 B. C., has now been sharply criticized as just such a literary *topos* [41]. It has been fashionable, until recently, to denigrate Diodorus as a latter-day Herodotus, credulous and unreliable. Luckily this view is being revised [42]. From the time of Alexander to the Roman annexation of Syria the Phoenician cities appear and disappear in the fragmentary sources

39. « The Achaemenid Empire : A Babylonian Perspective », *PCPS*, 214 (1988), p. 60-76. She turns to Persian and Babylonian sources which help to balance the portrait of Persia as the domain of « self-indulgent » rulers exercising dwindling authority over an « unwieldy bureaucracy » so that « Alexander, in the fullness of time, had only to stretch out his hand for the empire to drop like a ripe plum into his lap » (61).

40. J. TEIXIDOR, « L'assemblée législative en Phénicie d'après les inscriptions », *Syria*, 57 (1980), p. 453-64. This is noted by Grainger (p. 25 note 78), who states that its evidence « cannot be used for conditions in Phoenicia ».

41. D.F. GRAF, « The Origin of the Nabataeans », *Aram*, 2 (1990), p. 45-75 at p. 51-3.

available to us. G. notes that Tyre alone of the coastal cities resisted Alexander's advance to Egypt [43]. and posits that the Great King himself had *ordered* the city to do so. But to what purpose ? Persia sent no aid during the nine months of the seige. Only twenty years later, in 312 B. C., the resurrected city was again beseiged, this time by the rival dynast Demetrius Poliorcetes. Tyre's repeated uncompromising stance may be seen as a characteristic trait of its inhabitants, demonstrated as early as the Iron Age [44]. and not the logical outcome of a political decision. Herodotus (*Histories*, 1. 1 ; 7. 89), who probably knew better than we do, described Tyre as a repository or archive of Phoenician traditions. Protection of that heritage, often with the aid of its daughter-city Carthage, would be a powerful motivation for resisting aggression [45].

However destructive the wars of Alexander's successors, the treaty of Apamaea (301) ended the first phase of struggle for control of Syria by establishing the boundaries between the Seleucid and Ptolemaic portions. The Phoenician cities revived and, if the sketchy sources are reliable, even prospered for some eighty years. G. suggests that *c.*300 Aradus regained control of its mainland territory, which included the ports of Marathus [46] and Carne and the inland site of Simyra [47], when it was clear that Ptolemaic expansion into northern Syria would be contained at the Eleutherus (Kabir) River frontier just

---

43. The creation of the mole by Alexander's engineers has been the subject of a recent, thorough study by A. STEWART, « Diodorus, Curtius and Arrian on Alexander's Mole at Tyre », *Berytus*, 35 (1987), p. 96-9.

44. It took the Neo-Babylonian monarch Nebuchadrezzar *thirteen years* of continuous seige before Tyre eventually capitulated in 572. The city « has been subjected to some 21 different sieges and attacks over the millennia. In A.D. 1291 she was demolished and depopulated as part of the Mamluk `scorched earth' policy to prevent the return of the Crusaders... In every case but that one, she recovered almost immediately ». P.M. BIKAI, « The Phoenicians » in William A. Ward & Martha S. Joukowsky (eds.), *The Crisis Years : The 12th Century B. C. : From Beyond the Danube to the Tigris* (Dubuque, U.S.A., 1992), p. 132-41 at p. 138.

45. It is worth remembering that the library and archives of Carthage were given, as spoils of war in 146 B. C., to Rome's allies, the Hellenized kings of Numidia (Pliny, *Nat. Hist.* 18.22).

46. For the site of Marathos (mod. Amrit) see now M. DUNAND and N. SALIBY, *Le Temple d'Amrith dans la Pérée d'Aradus* (*BAH* Vol. 121) (Paris, 1985) which is cited by G. (p. 17 note 46) as a work not seen and N. Saliby, « Amrit » in J.-M. Dentzer and N. Othmann (eds.), *Archéologie et Histoire de la Syrie II : La Syrie de l'époque achéménide à l'avènement de l'Islam* (Saarbrüken, 1989), p. 19-30.

47. G.'s references to publications of archaeological work at Simyra/Tell Kazel (88 notes 3-4) are now superseded (inevitably) by the preliminary report of three seasons (1985-87) of excavations at that site. See the collaborative efforts of Leila Badre (« Introduction »), Helen Sader (« Tell Kazel and Ancient Simyra »), Eric Gubel et *al.* (« Areas I-III ») and two appendices, on epigraphy and ceramics respectively, in *Berytus*, 38 (1990), p. 9-124. The Hellenistic cemetery was uncovered in Area II of the tell.

north of Tripolis. It is possible that the inland portion of that boundary, not noted by G., was the enigmatic « Egyptian Wall » [48] in the northern part of the Massyas (Biqâ`) Valley [49].

Toponomy is not a subject of interest in this book [50], which is puzzling because place-names that are clearly dynastic should be of particular interest to the political historian of Hellenistic Phoenicia. Perhaps, in light of the two paragaphs directly above, this is an appropriate place to open a brief discussion which is continued in more detail in the appendix to this article. The Graeco-Roman toponomy of Phoenicia has not yet been the subject of a separate study [51]. Neither the Ptolemies nor the Seleucids made any real attempts to « colonize » Phoenicia with formal settlements of Macedonians or Greeks. This is not surprising in light of the protracted warfare in and around the region while it was nominally under Ptolemaic rule, and the rapid erosion of central authority there in the century and a half of Seleucid hegemony. But there is abundant evidence that certain already-existing settlements were renamed. In most cases the identity of the site is certain, and the approximate date of the renaming can be established. In very few cases has the Greek name survived among the toponyms of the present Lebanese republic. This is generally true where a native

48. Strabo (16.2.19) mentions an « Egyptian wall » near the sources of the Orontes River. Pliny (*HN* 5.77) states that « Opposing [Mt. Libanus], with a valley between, is [Mt.] Antilibanus, once connected [to Libanus] with a wall ». The two sources appear to be talking about the same phenomenon, with Strabo's specificity compensating for Pliny's vagueness.

49. C. GHADBAN, « Les frontières du territoire d'Héliopolis-Baalbek à la lumière de nouveaux documents » in T. Fahd (ed.), *La Géographie Administrative et Politique d'Alexandre à Mahomet* (Paris, 1981), p. 143-68 at p. 158-9. Physical traces of that wall still stand at the northern entrance of the Biqâ` (photos planche VIII).

50. This is well-exemplified in two places. On p. 153 G. introduces Strabo's mention (*Geog.* 16.2.18) of « Sinna and Borrama », two mountain strongholds held by bandits prior to the Roman conquest. Apart from misspelling Borrama, G. states that these sites « are now unlocated ». *Sinna* may be related to Mt. Sannîn, one of the higher peaks of the Lebanon range, and Borrama to the Lebanese town of Brummâna ; both are inland from Beirut. See R. DUSSAUD, *Topographie Historique de la Syrie Antique et Médiévale* (Paris, 1927), p. 89. A few pages later (155) G. claims that the modern location of « Gigartos », another Phoenician place-name in Strabo (*ibid.*), « is not known ». *Gigartos* was plausibly identified with the mountain village of *Zghourta*, inland from Batrûn (anc. Botrys), by Dussaud, *Topographie*, p. 81-3. None of these identifications is noted by S. Wild, *Libanesische Ortsnamen : Typologie und Deutung* (Weisbaden, 1973) ss.vv.

51. The forthcoming *Atlas of the Greek and Roman World*, projected for publication by Princeton University Press in 1999, will include double-spread maps of northern Syria (including northern Phoenicia) and southern Syria (including central and southern Phoenicia) at a scale of 1 :500,000. The project editor is Richard Talbert.

name preceded the Greek or Hellenistic name. Much work has already been done on the etymology of the modern place-names of Lebanon [52].

Greek toponyms in Phoenicia are of course not all associated with the Hellenistic age, or with Greeks. Byblos is a Greek toponym which pre-dates Alexander the Great. In that case the « new » name had a happy coincidence of *sound* with the old Canaanite toponym *Gubla*. The same may be true of Tripolis which, as noted above, was a Phoenician foundation of the fifth century B. C. [53]. Leôntopolis and Porphyrion, between Beirut and Sidon, appear in the *Periplus* (l. 78) of Pseudo-Scylax *c.* 400 B. C. But there are other Greek names as well, e. g. the rivers Eleutherus (mod. Kabir), Lycus (mod. Kelb) and Leôn (either the mod. Damour or `Awali [54]), as well as the towns of Ornithopolis (unidentified [55]) and Chalkis (identity disputed), and the promontory of Theouprosopon (Ras al-Shaqqa) [56]. Their exact antiquity is unknown. Particularly puzzling is the Leukê Kômê (« White Village ») between Beirut and Sidon wherein Mark Antony and Cleopatra were said to have met following Antony's Armenian campaign in 34 B. C. [57]. For the specifically Hellenistic toponyms see now the Appendix.

---

52. See in particular A. FREYHA, *A Dictionary of the Names of Towns and Villages in Lebanon* (Beirut, 1972 ; in Arabic) and S. WILD, *Libanesische Ortsnamen : Typologie und Deuting* (Weisbaden, 1973). The latter includes some Syrian toponymns from regions contiguous with Lebanon. A concise and colorful introduction to Lebanese geography can be found in Hitti, *Lebanon in History* 11-24. The best maps available are in the series prepared during the French mandate and tabulated by Brown, *The Lebanon and Phoenicia* XXV. A useful bibliography of maps is given in Ghadban, « Les frontières d'Héliopolis-Baalbek », p. 143-45 note 2.

53. K. Galling has suggested that behind Tripolis lay a Phoenician place-name with approximate consonantal values. This has yet to receive independent confirmation. See his « Zur Deutung des Ortsnamens *TRPL* = Tripolis in Syrien », *VT*, 4 (1954), p. 418-22.

54. Brown, *Lebanon and Phoenicia*, 71 rightly notes that equating the river Leôn (or Leontes) with the Litani (anc. *Lita*, which debouches near Tyre) « is a [modern] fiction with no ancient attestation » (for the incorrect identification see e.g. the map of Syria in A.H.M. JONES, *Cities of the Eastern Roman Provinces* (2nd ed., Oxford, 1971) opp. p. 226 ; KAHRSTEDT, *Syrische Territorien*, Karte IIa correctly marks the Litani as « Lita »). Since Ptolemy, *Geog.* 5.14.3 locates the Leôn between Berytus and Sidon, it is either an alternative ancient name for the Tamyras (Damour), halfway between those two cities, or the ancient name of the `Awali just northeast of Sidon.

55. G. hesitantly (II) sites Ornithopolis « between Sarepta and Tyre » ; in the index it is noted as in « Palestine ». It was overlooked by Jones, *Cities*.

56. *Theouprosopon* (or *Lithoprosopon* in a late source) presumably translates an indigenous toponym cognate with Hebrew *Penu-el*. On this see Brown, *Lebanon and Phoenicia* 135.

57. Plutarch, *Antony* 51.1. The site has never been identified. Color-names are of course among the most common of Near Eastern toponyms, with the color white predominant therein.

The king list from the Phoenician coastal cities is notoriously difficult to establish for the Hellenistic period. Many names are repetitious and without clear chronological markers. It is therefore virtually impossible to create a dynastic schema for any one city-state. The name Philoklês at Sidon is a case in point. After reviewing the various attestations of this monarch, G. argues (sensibly, I think) that the person behind the name was in fact a Macedonian, established in an honorary fashion under Ptolemy II Philadelphus. G. likewise makes good use of the archaeological report of Umm al-Amad near Tyre, based on a surface survey in the early 1940s, but not published until two decades later [58]. That site, with its splendid indigenous monuments and securely-dated Phoenician inscriptions, still awaits the attention it is due.

One subject of continual interest to G. is the impact of Greek culture on Phoenicia. He devotes five full pages (78-83) to just that topic. The term « Hellenization » is nowhere defined as it might relate to Phoenicia, and no clear distinction is made between it and « Hellenism ». G.W. Bowersock [59] has carefully, and I think correctly, demonstrated that « Hellenization » was basically a political process and « Hellenism » a cultural process. G. himself in a statement such as « Greek wine did not bring Platonic philosophy » (78) appears to understand this.

Given that Greek-Phoenician contacts are well-established archaeologically in the Bronze Age, G. nevertheless seems to feel that Phoenicia took an unduly long time to manifest its Greekness : « Hellenization... was a desperately slow process » (109). Should we expect any indigenous culture with deep and vibrant roots in its own soil to effect the rapid and profound absorption of another culture's values ? We should, in fact, expect only gradual acceptance of Greek culture in any of the civilized portions of the Near East. To look for that in the immediate aftermath of Alexander's conquest is expecting too much too soon.

By the Augustan age, as G. eventually does concede (185), some very marked cultural transference had taken place. He sees the bilingual (Greek-Phoenician) inscription from Arados [60] attesting a *gymnasiarchos*, as exemplifying « the whole Hellenistic cultural history of Phoenicia, for, by being a gymnasiarch, the man was overseeing the replacement of his Phoenician culture by that of the Greeks, from whom his city had struggled to escape for two centuries » (185-6). This misrepresents the meaning of « Hellenistic » and implies that cultural values were doffed and donned like costume changes.

The volume concludes with a chapter on « Phoenicians Abroad » ; in G.'s words « it is perhaps worth while to bring together into one chapter the evidence for Phoenicians' activity outside their homeland » (187). By the Hellenistic era

59. *Hellenism in Late Antiquity* (Ann Arbor, 1990), p. XI.

60. *IGLS* 7.4001, dated to 25 B. C.

the great age of Phoenician expansion into the western Mediterranean (and beyond) was long over. But it was not until the destruction of Carthage in 146 B. C. and the creation of a Roman province from its territory that western Phoenicia ceased to be an international, imperial force in the Mediterranean. This presents an awkward situation for the historian, who must assess both the pre- and post-war eras in any discussion of the Hellenistic period. There are difficulties of a different nature concerning the evidence for Phoenicians east of their Levantine homeland, particularly in the Persian/Arabian Gulf.

G. has trouble dealing with the Phoenicians in both areas. Tracking the whereabouts [61] of the western Phoenicians he finds difficult but not impossible : « We have the record of something over two hundred individual Phoenicians spread over the Mediterranean from Cyprus to Carthage during the three Hellenistic centuries. This is not many ». Nevertheless it takes nearly twenty pages of text for G. to sift through this epigraphic evidence, largely Greek and Latin but with some assistance from Phoenician and Punic inscriptions. Where were these expatriate Phoenicians ? The reader who finds difficulty with the following sentence will have, unfortunately, much company : « ...the Phoenicians in the Hellenistic world went where one would expect them to go, where everyone else went » (205). But this does not square with G.'s own observation (216) that there is no evidence of Phoenician entrepreneurs in the Black Sea area. Indeed, he goes so far as to postulate a trade « cartel » [Greeks and Scythians ?] in that region, created specifically to eliminate competition.

We are not aided by the visual evidence G. presents. The map (p. 200) labeled « Phoenicians in the West » terminates just west of Carthage and Sardinia/Corsica. This excludes all of Spain (including the Balearic Islands), Algeria and Morocco (including the Canary Islands), as if they lay outside the Phoenician political and cultural orbit. Those regions were Phoenician until the end of the Second Punic War (202 B. C.), and the Balearics were not claimed by Rome until the late first century B. C. Thus G. effectively has truncated the breadth of Phoenician political geography in an arbitrary manner reminiscent of several popular histories of Phoenicia (e. g. those of Sabatino Moscati and Donald Harden [62]) which terminate Phoenician history with the destruction of Carthage in 146 B. C.

The latest datable monumental Phoenician inscription is probably the short dedication set up by « Abdeshmun the Builder » in a shrine at Byblos. It is

---

61. Some idea of the difficulties encountered in identifying a Phoenician presence at a given site may be seen in N. STAMPOLIDES, « A Funerary Cippus at Eleutherna : Evidence of a Phoenician Presence ? », *BICS*, 37 (1990), p. 99-106. Phoenician activity in the Mediterranean grain-market may be attested in the reconstruction of a fragmentary Greek inscription ; see M.B. WALBANK, « Athens, Carthage and Tyre (*IG* II [2nd ed.] 342+) », *ZPE*, 59 (1985), p. 107-11.

62. S. MOSCATI, *The World of the Phoenicians* (London, 1973) ; D. HARDEN, *The Phoenicians* (2nd ed. London, 1980).

hesitantly ascribed to the early first century A. D. [63]. But Phoenician legends on coins continue at least until the very end of the second century. The letter-forms are archaic, as if there is a conscious attempt to establish a link with the past [64]. The Phoenician language, and through it Phoenician culture, were still viable in North Africa at the time of Augustine of Hippo [65]. The Phoenician homeland maintained its ethnic and political identity within the late Roman and Byzantine empires until the Islamic conquest [66].

In spite of the turmoil of the late Seleucid period, and the chronic anarchy of many communities, most Phoenician cities managed to sustain their integrity--several achieved autonomy--and none turned to piracy. Sidon, as G. notes (139) advertised itself on coins not only as *hiera* and *asylos* but also as *nauarchides* (possessing a fleet). The latter epithet was clearly a warning. Berytus was an exception, and G. goes to great lengths to point this out (123 ; 126-7). About 145 it was destroyed by the Seleucid usurper Tryphon, as Strabo (16.2.19) tells us. The motivation is unknown, but there may well be some connection with that city's wealthy trade emporium (« the *koinon* of Poseidoniastes ») on the island of Delos [67]. Strabo implies that Beirut was not restored until his own day.

Four pages (192-6) are devoted to the vexed question of whether or not the Phoenicians were indigenous to the Lebanese coast, or had originated in the Persian/Arabian Gulf, or elsewhere in the « Erythrean Sea ». G. is clear from the beginning that he discounts the very strong ancient tradition (from Homer well into the Byzantine period) that the Phoenicians migrated to the Canaanite coast from farther east. Unfortunately he doesn't tell us just *why* he finds that tradition unconvincing. Indeed, he discusses only the evidence of Strabo and Pliny the Elder and omits references to Homer, Herodotus, Pompeius Trogus (abridged by

Fischel (ed.) *Semitic and Oriental Studies : A Volume Presented to William Popper on the Occasion of His Seventy-Fifth Birthday* (Berkeley, 1951), p. 179-90. For a popular assessment of the Phoenician literary legacy see M. Sznycer, « Punic Literature », *Archaeologia Viva*, 1 (1968/69), p. 141-8. More Punic influence in late Latin literature has been detected by E. CHAMPLIN, « Serenus Sammonicus », *HSCP*, 85 (1981), p. 189-212.

66. From Pompey until Septimius Severus Phoenicia was administratively part of provincial Syria. *Syria Phoenice* as a separate province was created *c.* 194/5 and was subdivided *c.* 300 into western (*Phoenice*) and eastern (*Augusta Libanensis*) portions. A century later the coastal portion became *Phoenicia Paralia* (or *Maritima*) and the inland portion *Phoenicia Libanensis.* Under the Umayyads all of Phoenicia was administered (with southern Syria) as the *jund* of *Dimashq*.

67. W.A. LAIDLAW, *A History of Delos* (Oxford, 1933), p. 214. See also P. LEVEQUE, « Les Bérytiens à Délos », *L'Archéologie*, 12 (1975), p. 68-75.

Justin) and a scholiast's marginal comment on the *Odyssey* [68]. Pliny's remarks, in fact, have nothing to do with Phoenician *origins*. G. has thus narrowed his sources to just Strabo, who himself displayed some ambiguity about a Phoenician homeland in the Gulf.

In brief, G. reverses Strabo's argument (based on an early Hellenistic source no longer extant) for Gulf islanders colonizing classical Phoenicia and implies that certain Gulf islands (named Tylos and Arados by Strabo) owed their « Phoenician » aspect to « ...the activities and plans of Alexander [the Great] in the Gulf... ». To this speculative assertion he adds the false assumptions that « Strabo's island of Tyre [sic] is certainly not Bahrain (193) » and that Strabo's « Arados island » has vanished altogether in Pliny. Bahrain has by far the strongest claim to be Tylos, and Arados (mod. Muharrak) very plausibly is Pliny's secondary island of *Tylus minor*. G.'s solution to this age-old controversy : Strabo's and Pliny's accounts can be reconciled by assuming « that there were two Phoenician-colonized islands in the eastern Gulf » (194), and both colonies were of Hellenistic date. Subsequent claims that inhabitants from those Gulf islands colonized the central coast of Syria « may have been a joke, or maybe a mistranslation... » (194).

This won't do. The ancient tradition of migrant Phoenicians from the Gulf cannot be explained away in such a mechanical, manipulative fashion. Only one classical source, and that from very late antiquity, argues even parenthetically that the Phoenicians were indigenous to the Levant. That source is the *Dionysiaca* (Bk. 40 and *passim*) of Nonnus of Panopolis (fifth century A.D.). The argument for letting the ancient sources speak for themselves has been made most concisely by G.W. Bowersock [69] with additional comments by me [70]. The entire matter has now been reviewed judiciously and exhaustively by Jean-François Salles [71]. Salles has made it clear that the burden of proof now lies with those who would argue that the Phoenicians were *not* migrants to the eastern Mediterranean.

Hellenistic Phoenicia leaves much to be desired. There is distinct ambivalence shown regarding the social and economic importance of Phoenicia. At one point (75) G. presents us with several disclaimers : « Quantification of trade [i.e. in the third century B. C.] is a task which cannot even be contemplated, since no data exist » followed by « Thus the only possible account

68. All references are given in H.I. MACADAM, « Dilmun Revisited », *AAE*, 1 (1990), p. 49-87 at p. 67-69 esp. note 161.

of Phoenician trade in the third century B. C. is necessarily impressionistic, and inevitably wrong ». Yet G. cannot avoid reference to the Zenon Papyri, that vast and widely-published collection of documents (a portion of which relate directly to Phoenicia) from the archives of an official in the employment of the Ptolemaic minister of finance. Nevertheless « Zenon » appears at the top of p. 76 with no introduction or explanation, and the reference to the Zenon documents (76 note 79) fails to note the now-indispensable concordance, P. W. Pestman, *A Guide to the Zenon Archive* (Leiden, 1981).

But even within the parameters established by the author, i.e. an emphasis on the political history of the Phoenician city-states, his study is incomplete. Two examples will suffice. The Second Syrian War (259-254) [72], which was concluded by a dynastic marriage between the Ptolemies and Seleucids, is marginalized (without being named) in a few sentences (83). Once again the Zenon archive provides a vivid eyewitness to events when the Ptolemaic royal physician Artemidorus writes from Phoenicia to Zenon in Egypt : « We have just arrived in Sidon after escorting the Princess [Berenice] to the frontier [the Eleutherus River] ». From there she went with Seleucid escort to Antioch for the marriage to Antiochus II [73].

The Battle of Raphia (217 B. C.) is duly noted by G. (95-96) as a decisive defeat for Antiochus III, with the consequent loss of Phoenicia. But the reader of his account has no idea of how desperately the Ptolemaic forces fought--even drafting native Egyptians into the army to supplement its dwindling manpower. The latter decision led, predictably, to armed native unrest in Egypt. More importantly for the Hellenistic history of Phoenicia was the subsequent Ptolemaic interest in the northern Biqâ` Valley. G. cites (96 note 33) the recently-discovered Greek inscription (*SEG* 38[1988] #1571) [74] found at Labwe (anc. Libo) attesting an *archigrammateus* making a dedication to Sarapis and Isis on behalf of Ptolemy IV Philopator and Arsinoë III, presumably in the immediate aftermath of Raphia. It is not idle speculation to suggest that the ancient temple-site of Ba`albek (*Shamsimuruna* ? see note 81 below) was thereupon revitalized under the name Heliopolis as a Ptolemaic showpiece advertizing their dominion over Phoenicia [75].

---

72. G. notes the First Syrian War at p. 60 ; on p. 83 we find « The next war, the "Third Syrian"... ». There is likewise no entry for the Second Syrian War in the index.

73. *P. Cairo Zenon* 59251 (= A.S. Hunt & C.C. Edgar [eds.], *Select Papyri I* [Loeb Series], Cambridge & London, 1959 # 93 [252 B. C.]).

75. F. RAGETTE, *Baalbek* (London, 1980), p. 28. The podium of the later Roman « Temple of Jupiter » dates to the Hellenistic period.

Four other interrelated aspects of Phoenician history will also demonstrate shortcomings in *Hellenistic Phoenicia*. One is the transitional period in the first century B. C., when the Greek kingdoms became Roman provinces. This is a critically important era, particularly for understanding the later development of the Roman Near East. Jean-Paul Rey-Coquais has been especially attentive to the development of Phoenicia during the Augustan age. Several recent articles by him [76], nowhere noted by G., are now of fundamental importance in understanding this aspect of Phoenician history. A second consideration is the history of the Ituraean Arabs, who dominated Mt. Lebanon and the Syrian Hawran during and after Pompey's restructuring of the east. Their history has been the subject of a recent and far-ranging article of which G. was apparently not aware [77]. Thirdly is the founding of *Colonia Iulia August Felix Berytus* with the settling of veterans from two Roman legions. G. is surely right in arguing (177-8) for a date of 30 B. C. for that event, rather than the « traditional » later date of 15/14. But the literature cited to support his case does not include several important studies, two of them quite recent [78].

Lastly is G.'s briefest of references (66) to that vexed expression of political geography, « Koile Syria ». Other than noting that the term is « vague » there is no indication that it has provoked endless discussions among geographers, historians and philologists. No solution seems in sight, but the state of the debate is best summarized recently by Maurice Sartre [79]. There is much, much more to be done. *Hellenistic Phoenicia* provides the barest of outlines for the history of Phoenicians at home and Phoenicians abroad. It is neither a synthesis nor an in-depth study of this topic. But it does perform a very

APPENDIX

Some Hellenistic Toponymns of Phoenicia

The toponomy of Phoenicia provides a number of dynastic names or names clearly associated with one or another of the rival Hellenistic kingdoms in Syria and Egypt. In every case the Greek name would appear to be honorific only, with no political significance other than a royal favor shown to a Phoenician town or city. Such benefaction might be a reward for loyalty or simply recognition of commercial value. Seleucid toponyms [80] are found in northern and central Phoenicia, coastal and inland. Ptolemaic toponyms are associated particularly with the Biqâ` Valley (the one area of Phoenicia which the Ptolemies held until 200 B. C.), and one or two sites on the coast. I shall begin with the latter.

There are three place-names which can be associated with Ptolemaic rule in Phoenicia. One is Heliopolis (Ba`albek), the ancient sacred area in the central Biqâ`. The time and circumstances of its naming are unknown, but there is obviously some correlation between the cultic aspect of the Phoenician site and Egyptian Heliopolis (ancient Om) in what is now Cairo. Polybius makes no mention of Heliopolis in his account of the campaigns made by Antiochus III through the Biqâ`. There is also no reference to the « Egyptian Wall » (noted above) across the northern entrance of the valley. Since the ancient shrine at the site of Heliopolis [81] apparently had no strategic value it may have been among the nameless « other towns of the region » captured (temporarily) by Seleucid forces during the Fourth Syrian War. The major Ptolemaic garrisons were placed precisely where the Biqâ` narrowed, i.e. at Gerrha (Anjarr ?) and Brochoi, both sites with indigenous names.

Another Ptolemaic place-name is Arsinoë. Stephanus of Byzantium's *Ethnica* lists an Arsinoë which is described as a « city of Syria, in the *Aulôn* ». This « Arsinoë of the Aulôn » (presumably named for Arsinoë II, *c.* 276-270)

---

80. It is particularly disappointing that GRAINGER, *Cities of Seleukid Syria* did not include the cities of Phoenicia south of the Eleutherus or south of Laodiceia *ad Libanum* in several places in the text where it would have been appropriate : « The Cities and the Villages » (Chap. 4) and Appendix I : « Concordance of City-Names ».

81. The indigenous (Aramaic) place-name for this site may be *Shamsimuruna* (« Shamash is our Lord ») ; see P. BORDREUIL, « A l'origine du nom d'Héliopolis-Baalbek ? » in Gatier, *Géographie Historique*, p. 309-10. Greek *Helioupolis* simply affirms the recognition of the sun-god as the predominant deity of the site.

was long ago identified as Damascus by Victor Tscherikower [82]. But Damascus does not lie in the « Valley of Syria » nor in a « Royal Valley » (Abilene ?) mentioned by Strabo. The Aulôn of Syria, as we know from the Zenon papyri and Polybius, is specifically the « Massyas » or « Marsyas » Valley between the Lebanon and Antilebanon ranges. Arsinoë would be an as yet unidentified site in the Biqâ`, as Père Abel suggested [83]. But it is more likely that the Ptolemaic toponym disguises a known site such as the fortress of Gerrha.

Equally difficult to locate is Stephanus' « Arsinoë of Coele Syria », identified with the preceding Arsinoë (and therefore with Damascus) by A.H.M. Jones [84]. Tscherikower [85] believed it was located in northern Palestine, a supposition strengthened by recent excavations at Tell Anafa in the north-eastern corner of the Huleh Valley in northern Israel [86]. The absence of both Arsinoës in extant Hellenistic sources means nothing.

The third name is « Heracleia in Phoenicia » mentioned in one letter of the Zenon correspondence (*PCZ* 59088.9-10) dated 258 B. C. [87]. It also appears among the thirty Heracleias registered in Stephanus' *Ethnica*. The two Phoenician Heracleias were identified with each other, and with the Heracleia of Strabo's *Geography* (Bk. 16.2.7-8) by Père Vincent [88]. The assumption that the two Heracleias « in Phoenicia » were the same town is probably correct, but Strabo's Heracleia is known to lie between Seleuceia (the port of Antioch) and Laodiceia *ad Mare* (modern Lâdhiqîyah) on the north Syrian coast. That would be near the heartland of the Seleucid kingdom and considerably beyond the limits of territory controlled by the Ptolemies. Furthermore no town or city that far north would be designated as « in Phoenicia ».

The identity of « Heracleia of Phoenicia » was discovered by that indefatigable topographer Ernst Honigmann [89]. He noticed that a list (in Greek) of bishops attending the synod of Antioch (A.D. 444) included an Epiphanius « of Heracleia ». The Latin translation of that list gave Epiphanius' bishopric as

87. An improved reading was published in T.C. Skeat (ed.), *Greek Papyri in the British Museum*, Vol. 7 : *The Zenon Papyri* # 1933 lines 9-10. « Heracleia » with no qualifier, but almost certainly the same town, is also mentioned in *PCZ* 59044.1-2 and 59093.9, both documents of approximately the same date.

88. L.H. VINCENT, « La Palestine dans les papyrus ptolémaiques de Gerza », *RB*, 17 (1920), p. 161-202 at p. 178 note 2.

89. *Patristic Studies* (Rome, 1953), p. 123-4.

« Arca » (Tell `Arqa, near Tripoli). The curious survival of the Greek name for more than seven centuries solved the mystery. Why Arca would be designated « Heracleia » is now as obscure as when that change of name occurred. Apart from the widespread popularity of the name is the obvious association of Greek Heracles and Phoenician Melqart, e. g. at Tyre and distant Gades (Cadiz in Spain). There is as yet, however, no evidence for a cult of Melqart/Heracles at Arca. Heracles was honored, along with Dionysius, as a « dynastic deity » of the Ptolemies.

Several Seleucid dynastic names are associated with Phoenicia. Two Antiocheias are known. One is clearly identified by Stephanus as « Antiocheia of Pieria which the Syrians call Aradus » [90]. The renaming of Aradus can most probably be attributed to Antiochus II (261-246) following the Third Syrian War. Less certain is the identification of an « Antiocheia under Libanus » mentioned by the second century A.D. historian Appian (*Syriaca* 57). The context is a list of cities attributed to Seleucus I (312-281) and this name occurs between references to a « Laodiceia in Phoenicia » and « Apamea of Syria ». The attempt by Jones [91] to see some analogy between this name and the later *Caesaraea ad Libanum* (Arca) is pure guesswork. Appian's association of « Antiocheia under Libanus » with Seleucus I, if correct, would mean the site must have lain north of the Seleucid/Ptolemaic border at the Eleutherus River.

There are also two Laodiceias within Phoenician territory. One is identified with ancient Qadesh (mod. Tell Nebi Mend) on the western bank of the upper Orontes. This is the « Laodiceia of Lebanon » cited by Polybius (*Hist.* 5.45.1), the Laodiceia *sub Libano* of Pliny the Elder (*Nat. Hist.* 5. 82), and the Laodiceia *Scabiosa* (Rough ?) » of Ptolemy (*Geog.* 5. 14. 16) and the Peutinger Map [92]. The fact that it appears in Polybius in the context of the Third Syrian War means that its re-naming occurred at least as early as the reign of Antiochus II. If this is Appian's (*Syriaca* 57) « Laodiceia in Phoenicia » a foundation date as early as the reign of Seleucus I would be correct [93].

Beirut was re-named « Laodiceia of (or "in") Phoenicia », perhaps by Seleucus IV (187-175). Bilingual coins of the second century B. C. proclaim

---

90. *Pieria* refers to the old Macedonian town, and may be a nostalgic reflection of the earliest inhabitants of Antiocheia.

91. *Cities* 244 and note 44

92. *Scabiosa* is Ptolemy's transliteration into Greek of the Latin name, the implications of which are unclear. The nickname begs comparison with that of Laodiceia *Combusta* (« Burnt ») near mod. Konia in Turkey (Strabo, *Geog.* 14. 2. 29). That colorful name was probably due to the smelting-furnaces near the site ; see W.M. CALDER, « A Journey Round the Proseilemmene », *Klio*, 10 (1910), p. 232-42 at p. 242.

93. GRAINGER, *Cities of Seleukid Syria* does not include this site in his discussion (Chap. 3) of cities founded by Seleucus Nicator, nor does it appear on his map, « The Cities of Seleukos » p. 232. Archaeological work at the site has produced some Hellenistic material ; see the reports cited by Grainger, *ibid.* 208.

Beirut as « Laodiceia the *mêtrôpolis* of Phoenicia » (in Greek) and either « Laodiceia which is in Canaan » or « Laodiceia the mother of Canaan » (in Phoenician). Contemporary Greek inscriptions from Delos attest « Laodiceia in Phoenicia » [94]. But if this is to be identified with the « Laodiceia in Phoenicia » of Appian, as seems likely, his attribution of it to Seleucus I is an anachronism.

Modern sites confidently identified with Hellenistic toponyms share some common features. Many are located at strategic points and lend themselves to the garrisoning of military detachments. All but Beirut were on or near borders between Seleucid and Ptolemaic portions of Phoenicia. Only two, however, Antiocheia/Aradus and Laodiceia/Beirut, enjoyed the privilege of coining. The reason for the granting of such a coveted prestige remains unclear. Commercial preeminence was undoutedly a major consideration, and ranked those two cities with the other important coastal emporia of Tripolis, Byblos, Sidon and Tyre.

Thalassocracies in Bronze Age eastern Mediterranean trade: making and breaking a myth

A. Bernard Knapp

Downloaded by [UQ Library] at 19:18 02 November 2014

The long history of archaeological excavation in the Mediterranean, and the long-standing scholarly interest in Bronze Age Mediterranean trade, have provided a nearly unsurpassed collection of material and ideas with which to study prehistoric production and exchange. Four types of trade mechanism have been proposed to explain the wide panorama of data from the Aegean and eastern Mediterranean: (1) centralized political (regional or interregional) control (Minoan, Canaanite); (2) localized control by single polities, with intermediaries or emissaries serving to link different nodes (Ugarit, Enkomi, Knossos); (3) freelance or entrepreneurial trade (from market exchange to 'tramping);' and (4) ceremonial or 'gift' exchange. Such mechanisms tend to crosscut Renfrew's modes of trade (1975: 41–6), which were intended specifically to characterize spatial patterning in archaeological data. The most limiting aspect of these approaches is a failure to consider factors of production and consumption in the overall assessment of trade. Distribution patterns are taken into account, but what survives in the archaeological record is not fully representative of all goods traded or marketed (Fulford 1987: 59–60). Heuristically, these approaches are not without value; but when used as umbrella-like explanations to cover the full range of exchange behaviour (resource acquisition, production, transport, distribution, consumption), their validity must be questioned.

This study presents a reassessment of notions of politico-economic pre-eminence, ethnicity and directionality in Bronze Age eastern Mediterranean trade, and reconsiders the empirical bases for Aegean and Syrian thalassocracies, and for Egyptian supremacy over Mediterranean shipping and trade. Alternative trade mechanisms and models of exchange are suggested, and attention is given to perspectives that may advance our understanding of past political and economic processes.

Thalassocracies

Some interpretations of directionality and ethnicity in Mediterranean trade were formulated over fifty years ago and remain intact despite the weight of evidence against

unilateral explanations. The concept of a Minoan 'thalassocracy', furthermore, has been around for almost 2,500 years (Thucydides I, 3–8) and formed part of the Classical worldview on nautical activities. Eusebius' Chronicon lists seventeen Aegean or Levantine groups – e.g. Rhodians, Lydians, Cypriotes, Phoenicians – who were thought to have exercised political or military control over some part(s) of the eastern Mediterranean during the Late Bronze-Iron Ages (Myres 1906). Such 'thalassocracies' were probably modelled on that of fifth-century Athens, or on later perceptions of the (localized) Athenian thalassocracy, which existed primarily to control piracy or to forestall foreign invasion. Even if such a view could be extrapolated back to the Archaic-period polis system, does the concept have any relation to Mediterranean maritime supremacy – political or economic – during the Bronze Age? What evidence supports such notions?

Aegean

The concept of a Minoan thalassocracy during the Middle to Late Bronze Ages is well entrenched (Hägg and Marinatos 1984). Several sociopolitical or ideological bases of Minoan sea power have been proposed: conquest, transplanted 'community colonies', merchant enclaves or 'special trading relationships' (Branigan 1981; Schofield 1982; Wiener 1991). In a spirited defence of Minoan supremacy Wiener proposes that various sites in the Cyclades and Dodecanese, and along the western coast of Anatolia, formed part of a Minoan empire, and that Knossos dominated the principal trade networks within the Aegean (1990: 145–54). However, even if the Minoans exercised some level of control over intra-Aegean trade, their participation in exchange systems farther east has been challenged (Kemp and Merrillees 1980: 278–9; Branigan 1989: 66–7). E. and Y. Sakellarakis maintain that Egyptian *Keftiu* documents 'clearly indicate the leadership of Crete, the so-called "Minoan Thalassocracy"' (1984: 202). Wachsmann, however, argues that *Keftiu* representations in Egyptian art need not represent an Aegean presence in Egypt (1987: 42; Muhly 1991a: 236). Egyptian wall-paintings, furthermore, may simply represent the people of *Keftiu* as bearers of gifts or merchandise (Merrillees 1968: 194). The recently uncovered 'Minoan style' frescoes at the MB-LB site of Tell el-Dab'a in Egypt's eastern Delta (Bietak 1992), and Minoan-style painted-plaster floors at Tel Kabri in Israel (Niemeyer 1991), open up the likelihood of diverse social or political contacts between Crete and Egypt or the southern Levant. However, unlike the Egyptian wall-paintings, these new discoveries apparently treat cultural (possibly ceremonial) themes, and have nothing to do with economic activity or political dominion in the Bronze Age Mediterranean.

Scenarios of Mycenaean pre-eminence in eastern Mediterranean trade resulted from Claude Schaeffer's attempt to explain the common occurrence of stone-built, barrel-vaulted, 'Mycenaean' tombs at Ugarit, and the preponderance of LHIIA-IIIB pottery found on Cyprus, at Ugarit and elsewhere along the Levantine coast and in Egypt (Schaeffer 1939: 72–97; Åström 1973; Courtois and Courtois 1978: 292–363; Bell 1982). When Catling alluded to 'intensive trade relations' between the Aegean and Cyprus, he clearly felt that the Mycenaeans manned the rudders of merchantmen trading in the eastern Mediterranean (1964: 49–50, 54, 300–1). In addition to the evidence of Mycenaean pottery in the Levanto-Egyptian sphere, Immerwahr drew upon Mycenaean material in

Downloaded by [UQ Library] at 19:18 02 November 2014

Italy, Sicily, and Lipari (and Baltic amber in Mycenaean tombs) to suggest that 'Mycenaean traders' held a monopoly on trade within the Aegean and directly influenced or dominated other aspects of eastern Mediterranean trade through 'merchant colonies' (1960: 6–12).

From distributional patterns of Mycenaean pottery in the south-east Mediterranean, Hankey concluded that Mycenaean trade either 'radiated' from Greece, or that the Mycenaeans shared eastern Mediterranean shipping with 'Syrians' and 'Phoenicians'. She interpreted the differences in quantity between Mycenaean wares found on Cyprus (numbered in the thousands) and those recovered in the Levant (numbered in the hundreds) as a form of 'down-the-line' trade (Renfrew 1975: 41–3), wherein Cyprus received the bulk of the pottery and the south-eastern Mediterranean the remnants (Hankey 1967: 145–7). If, however, some of this 'Mycenaean' pottery had been produced on Cyprus or in the Levant (Asaro and Perlman 1973), or if the numbers involved in the different areas are not as disparate as suggested (Catling 1980: 16–18), the basis of Hankey's argument breaks down – a point which may have prompted her suggestion that Cypriot ships carried Aegean goods to the south-east Mediterranean (1981: 44–5).

Merrillees (1974: 7–8) condemned the concepts of thalassocracies or commerical monopolies, and argued that sea-borne trade during the eastern Mediterranean Bronze Age was primarily in the hands of private entrepreneurs. George Bass's meticulous excavation and publication of the Cape Gelidonya shipwreck led him to deny any possibility of a 'Mycenaean monopoly on sea traffic' (1967: 165), a position still maintained (1986: 296). Sasson, who sought to demonstrate Canaanite maritime involvement in eastern Mediterranean trade, observed that 'it would be very difficult to disprove the widely held contention that Egyptian, Minoan and, later, Mycenaean sea-power were dominant in the Late Bronze Age' (1966: 128 n.13). Yannai's (1983) detailed refutation of Mycenaean involvement in eastern Mediterranean trade seriously undermined the thalassocratic pillar of Aegean prehistory. Because the Linear B tablets provide no direct reference to overseas trade (cf. Killen 1985: 262–70), Mycenaean trade may not have relied on palatial capital (Blitzer 1990: 708). Finally, even if one accepts the *Ahhiyawa*-Achaean equation (Bryce 1989), Steiner has removed the linchpin of a presumed *Ahhiyawa* presence along the Levantine seaboard (1989: 409–11) and thus eliminated the textual evidence for Mycenaean involvement in eastern Mediterranean trade.

Syrian

The concept of a Syrian (Canaanite or 'Semitic') thalassocracy was formulated during the mid-1960s by Sasson (1966) and Bass (1967: 1973). From the evidence of the Cape Gelidonya wreck, Bass maintained that the 'Phoenician' inhabitants of the Syrian coast played a major part in the Late Bronze Age trade in metals, from Sardinia to the Levant. Essentially Bass argued that copper oxhide ingots were manufactured by Syrians on Cyprus and traded by Syrians to the Aegean, conceding only that the strong Syrian influence on Cyprus might make Cypriot and Syrian merchantmen indistinguishable (1973: 36). In his study of Aegeans in Egyptian wall-paintings, Wachsmann (1987) echoes the ideas of Bass and maintains that Syrians – using Syrian or Cypriot ships – dominated the trade between the Aegean and the Levant or Egypt.

Downloaded by [UQ Library] at 19:18 02 November 2014

According to Bass, before the destruction of Knossos, the Minoans shared Syria's pre-eminent role in eastern Mediterranean trade; after its demise, that trade became a Syrian monopoly. Wachsmann concurs and argues that, with one exception, it is Syrians who are shown carrying the oxhide ingots depicted in Egyptian tomb paintings (1987: 50–1). In Bass's scheme, oxhide ingots formed the rationale for Aegean-eastern Mediterranean trade and were exchanged for Minoan – and later, Mycenaean – pottery. As Yannai points out (1983: 104), this makes much better sense if Cypro-Levantine middlemen functioned as a mechanism to answer regional factors of supply and demand; it also helps to explain why pottery might have served as a suitable item of exchange for copper. The continuing excavation of the Ulu Burun shipwreck – and the fact that all ingots from the Cape Gelidonya and Ulu Burun shipwrecks thus far tested by lead isotope analysis are consistent with production from Cypriot ores (Gale 1991a: 227–31; cf. Muhly 1991b: 188–9) – have ameliorated Bass's views to the extent that Cyprus is allowed some autonomy and the Mycenaeans permitted a possible merchant on board the ship. Syrians, however, are still regarded as the 'authority' behind the production and trade in metals (Bass 1986: 294–6). Muhly has persistently challenged Bass's interpretation (Muhly et al. 1988: 294–5), initially arguing that the Cape Gelidonya ship was Mycenaean in origin (Muhly 1972: 212), but soon deciding that it represented entrepreneurial trade (Maddin and Muhly 1974: 25). Taking the material evidence from the shipwreck as a whole, and granting that the personal ornaments are preponderantly 'Syrian', it must be said that the ethnic origins and home port of the Gelidonya ship remain uncertain, and that it could have been run by Bronze Age merchants acting on their own behalf.

Sasson accepted without question Bass's identification of the Cape Gelidonya wreck as 'Syrian', its destination as the Aegean. Using a range of epigraphic and artistic material from the mid-second millennium Levant, Egypt and Mesopotamia, Sasson made his case for a 'Canaanite thalassocracy' during the Late Bronze Age (1966: 128–31). With the exception of Cyprus, however, and one text that refers to Crete, much of the material discussed by Sasson concerns trade within the Levant, or trade between the Levant and Anatolia or Mesopotamia. Other specifically Mediterranean links suggested by Sasson are intriguing but contentious (a Canaanite commerical 'depot' at Boeotian Thebes), and his notion that Canaanite merchants were stationed in 'the capital cities of . . . Egypt, Alasia, Babylonia and Assyria' is unsubstantiated (1966: 135 and n.53). Sasson cited at least four texts indicating that a certain amount of trade was conducted through private hands and concluded his argument by noting (1966: 137–8):

> in an age when land caravans were often robbed and when respectable rulers did not hesitate to plunder travelling merchants, there seems to have existed in Canaan an 'entente' among the great powers, whereby ships of various cities, the seafarers, and their cargos were respected in time of peace.

Such an 'entente' among the major powers of the time – to respect ships, cargoes and merchants – undermines the very concept of a thalassocracy. The existence of localized control of certain segments of Levantine trade is far more likely.

Anita Yannai presented the most compelling argument for Levantine participation in fourteenth to thirteenth century BC eastern Mediterranean trade (1983: 101–14). Her discussion makes use of a wide range of Levantine material in the Aegean (seals, ivories,

Downloaded by [UQ Library] at 19:18 02 November 2014

pottery, metal goods) and the comparative lack of Mycenaean material in the Levant: she considers documentary and other historical evidence, or the lack of such, and offers a sophisticated treatment of possible economic mechanisms in Mediterranean trade. Yannai concludes that trade was indirect and involved the exchange of finished products for raw materials: Cypro-Levantine middlemen – operating from Cyprus – best explain the state of the evidence and at the same time provide the profit-oriented, supply-demand mechanism that regulated the exchange process. Mycenaean involvement accordingly is discredited, and at the same time the notion of Syrian hegemony is reduced to the part played by individual entrepreneurs.

Egyptian

The concept of Egyptian supremacy over the seas of the Late Bronze Age eastern Mediterranean was promulgated by Säve-Söderbergh in his monograph on the navy of the eighteenth Dynasty (1946: 34–42). By the fifteenth century BC Tuthmosis III had inaugurated a policy of seizing port towns along the Levantine coast to serve as supply stations for the Egyptian army. He first adopted this strategy at the end of his fifth Asian campaign by appropriating two (cargo?) ships and sailing his troops swiftly back to Egypt, thus avoiding the lengthy march overland (Wilson 1969: 238–9). Subsequently Tuthmosis used ships to transport his army directly to the Levantine coast, where he maintained several ports (Wilson 1969: 239; Säve-Söderbergh 1946: 36). Furumark interpreted this naval strategy as an indication of 'complete Egyptian supremacy on the seas' (1950: 247). Linder suggested that such 'trading-posts' were transformed into 'flourishing centers of maritime commerce', but increasingly gained political and economic independence from Egypt (1973: 317–18).

Despite a tendency among Egyptologists to assume some level of Egyptian prominence in eastern Mediterranean trade (e.g. Hayes 1973: 386–8; cf. Kemp 1990: 257–60), the evidence tallied does not add up to Egyptian supremacy over the seas. The concept of an Egyptian navy must be understood in light of the possibility that most of its ships were either requisitioned or captured Levantine ships (Sasson 1966: 130 and n.21). On Egyptian wall-paintings and in documentary evidence, those ships that can be identified as merchantmen were of Levantine, not Egyptian origin (Artzy 1985: 138–9). Yet Egyptian New Kingdom temples certainly possessed ships outfitted for use in overseas trading missions (Wilson 1969: 269; Kemp and Merrillees 1980: 278 and n.619). Furthermore, it is generally acknowledged that '*Keftiu*-ships' were so named because they voyaged to or from the Aegean; whether they were of Aegean, Egyptian or even Syrian origin cannot be proven one way or another (Vercoutter 1956: 53–5; Wachsmann 1987: 121).

The level of Egyptian hegemony in the Levant was insufficient to curtail the movement of foreign vessels: Theban tomb paintings depict the arrival of Syrian trade missions during the reign of Tuthmosis III (Merrillees 1968: 172–4) and confirm the presence of 'Aegean' missions at least up to the reign of Amenophis II (Wachsmann 1990). Haider (1989) maintains that direct Aegean–Egyptian contacts continued through the reign of Ramesses II. The Amarna letters from *Alashiya* demonstrate unequivocally that – at least during the fourteenth century BC – the king of Cyprus firmly controlled the Mediterranean end of Cypro-Egyptian trade (Knapp 1985: 237–8); moreover, the trade in copper continued

Downloaded by [UQ Library] at 19:18 02 November 2014

throughout the thirteenth century BC. Finally, the cessation of the extensive trade in Cypriot and Mycenaean pottery, at least in part a trade in perfumed oils, toward the end of the eigtheenth Dynasty probably had less to do with Egyptian policy (Helck 1979: 114–15) than with a resurgence of Cypriot or Syrian trade, or with other, politico-economic factors of wider interregional significance (Merrillees 1968: 198–202).

The concept of an Egyptian 'empire' in the Levant, or of Egyptian domination over eastern Mediterranean seas, owes it prominence to Egyptian ideology, wherein political or economic 'contracts' between Egypt and 'the other' had to conform to Egyptian notions of divine kingship and the associated bonds of dependency (Kemp 1978: 8–9). Because Levantine city-states were ruled by hereditary kings who themselves were not beyond divine aspirations, and who exercised wide-ranging political and juridical functions, the Egyptian political hierarchy made no attempt to reorganize Levantine society; rather Egypt sought to obtain services or 'tribute' within the bounds of standard trade procedures (Kemp 1978: 48–9). The administration of Syria-Palestine rested ultimately in Egyptian hands, but Egypt's military or naval presence was little more than symbolic, and local economies were structurally independent of the pharaonic economy. 'External supplies [*'inw*] that were in fact the result of trade or gift-exchange are recorded and presented as tribute for the sake of control over the inner Egyptian populace' (Liverani 1990: 260). Egyptian royal inscriptions and the Amarna letters each have their own literary conventions and ideological motives. Both deal with different aspects of sociopolitical reality, and neither can be taken at face value. Although the Amarna letters present as political equals states and rulers who were anything but (Liverani 1990: 264), they reveal the reciprocal nature of certain aspects of Late Bronze Age trade in the eastern Mediterranean and help to discount notions of Bronze Age thalassocracies in general.

Deconstructing thalassocracies

During the ninth to sixteenth centuries AD, struggles between the Byzantine East, various Muslim polities, the Christian West and the Barbary Corsairs show that maritime supremacy in the Mediterranean was hard won, loosely maintained and quickly lost (Pryor 1988). The mechanics of overland trade in the Levantine Late Bronze Age involved politico-economic status, co-operation and competition, the type and nature of goods exchanged and the ideology of exchange. Similar factors affected contemporary maritime trade in the eastern Mediterranean, but many fleets were active: Egypt, several Levantine states, Cyprus, Cilicia, Mycenaean Greece, Minoan Crete. Several polities produced raw materials, comestibles and finished products for exchange in an interregional exchange system that has been termed 'conditioned co-existence' (Liverani 1987: 67). In such a situation, dominion over the seas could not have existed.

Tradition first led several prominent Aegean or eastern Mediterranean archaeologists to make informal inferences, arrived at in part by analogy with later historical situations (the Athenian thalassocracy) or with literary tradition (the Minoan thalassocracy). Inference soon became assumption, and because certain features of the archaeological record ('Mycenaean' tomb architecture at Ugarit) conformed with the assumption (Mycenaean colonies at Ugarit), the inference eventually became 'fact' (an Aegean

thalassocracy). Other archaeological features (Mycenaean pottery in the Levant) seemed to fall into line with the fact, which became well entrenched. Archaeologists of different backgrounds, however, read such 'facts' in different ways and assigned alternative meanings to the same material. In other words, the archaeological record, as 'text', has its own autonomy and is open to multiple interpretations on the part of its 'readers'. As interpreter of this text the archaeologist must consider not only the material data and any associated documentary evidence, but also how the two are interrelated, and how pre- or proto-historic cultures may be represented meaningfully. Here our task is to deconstruct the notion of 'thalassocracy' and, in the light of additional data as well as a more pluralistic approach, to examine briefly other likely mechanisms of trade at work in the Bronze Age Mediterranean.

Local control

Several Mediterranean island or coastal emporia (e.g. Ugarit, Enkomi, Kommos, Marsa Matruh, *Nuraghe* Antigori) functioned as maritime junctions or stations, where a wide variety of goods was available for sale, exchange or trans-shipment (Portugali and Knapp 1985: 61–2; Knapp 1992). These maritime centres owed their commercial (and social) success to location along the most commonly used sea lanes, which may have been dictated in part by pre-existing commercial facilities (Cherry and Davis 1982: 340). Whilst access to certain resources may have conditioned the location of certain port settlements, regional control over trading would have heightened the significance of ports in agriculturally or mineralogically marginal areas – Marsa Matruh is a striking example in the Mediterranean (White 1989).

Throughout the Middle Ages in the Mediterranean, the key to maritime power and commerce lay in control over a string of island naval bases and commercial ports located astride the coastal-insular sea lanes; these ports stretched from the Balearics in the west to Rhodes, Cilicia and Cyprus in the east (Pryor 1988: 8). They offered a refuge from pirates and the opportunity to take on daily renewals of food, water and wood. In discussing the activities of ships and seamen at such ports, Braudel provided his classic description of 'tramping' (1972: 107):

> 'Tramping' also made it possible to take on cargo. It gave ample opportunity for bargaining, and for making the most of price differences. Every sailor, from captain to cabin-boy would have his bundle of merchandise on board, and merchants or their representatives would travel with their wares. The round trip, which could last several weeks or months, was a long succession of selling, buying, and exchanging, organized within a complicated itinerary. In the course of the voyage, the cargo would often have completely altered its nature.

Commercial trade

As a mechanism for moving commodities, tramping may have characterized certain aspects of entrepreneurial trade in the Bronze Age eastern Mediterranean (Cherry and Davis 1982: 339–40). Private enterprise is not nearly as visible as palatial initiative in either

Downloaded by [UQ Library] at 19:18 02 November 2014

archaeological or documentary evidence, yet there is no doubt that it existed alongside state-level trade. Based on Artzy's reconstruction of Bronze Age shipping, for example, the 'multi-purpose' ships of the Middle and Late Bronze Ages would be representative of state-dominated trade, whilst the 'merchantmen' of Late Bronze II – 'round' boats as opposed to 'long' boats, or galleys – would be indicative of freelance commercial trade (Artzy 1985: 138–40; 1988: 184). Whether private initiative or state control prevailed, the movement of goods was also affected by factors of transport, technology, value and ideology. Documentary and ethnohistoric evidence from a wide range of cultures in time and space shows that different types of commodity may move through different exchange systems (e.g. Leach and Leach 1983); that metals and surplus goods in premonetary economies may function as valuables and thus move in all directions (Portugali and Knapp 1985: 65); and that demand is never constant or uniform – the same goods may travel in any direction through different exchange mechanisms and/or by different means of transport, in different time periods (Knapp 1991: 50–2).

Downloaded by [UQ Library] at 19:18 02 November 2014

Gift exchange

Through detailed research into the form and meaning of gift exchange as portrayed in the contemporary documents of western Asia and Egypt, Liverani (1987; 1990) and Zaccagnini (1987) have provided an entirely different perspective on the gift-commodity model (Morris 1986; Knapp 1988). They have examined the moral and social connotations of ceremonial exchange (as counterpoint to commercial trade) and have provided new insights into gender, cognition and representation through their detailed philological and politico-ideological examination of royal rhetoric.

Gift exchange played a prominent role in the international, state-level trade of the Amarna period and must be kept separate from the commercial level of trade (whether under private or state control). When the king of *Alashiya* informed pharaoh that his own people had exhorted him to secure payment for past shipments of timber to Egypt (Moran et al. 1987: 27–8 (EA35)), the commercial character of trade – even between heads of state – cannot be questioned. The commercial pattern of exchange aimed chiefly to maximize profits, without concern for social relationships or the ideologies of state. The socio-ideological aspects of ceremonial exchange were meant to be exclusive and highly personalized (Zaccagnini 1987: 63–4). The merchants, royal messengers, state agents or freelance traders who conducted these activities clearly knew their position in either (or both) the commercial or ceremonial spheres of exchange, but this did not prevent 'conversions' from prestige goods to commodities, or the multiple circulation of gifts in two or more directions.

Discussion: economic theory and Bronze Age Mediterranean trade

Fieldwork and research during the past decade have produced a wealth of new data on Bronze Age Mediterranean production and exchange (e.g. Gale 1991a; Mathers and Stoddart 1992). Several key sites and new excavations have greatly increased the range of material available to study Mediterranean Bronze Age trade; at the same time these

factors have altered dramatically our understanding of the scope and extent of Mediterranean trading systems (Knapp 1990). Attempts to synthesize these data – even on a regional scale – have been limited, understandably so given the limitations imposed by an ever-expanding database and the finite nature of expertise. The most thorough attempt to model the nature of Mediterranean Bronze Age trade is that of Andrew and Susan Sherratt (1991), who seek to bury once and for all Weberian notions on the centrality of agrarian factors to the ancient economy (Snodgrass 1991; cf. Weiner 1991: 325–7) and to replace them with factors of 'conspicuous consumption' and exchange. The Sherratts are concerned with the incentive for trade, namely the desire by emergent elites to acquire goods that have social significance. The model draws in factors of production, consumption and exchange: the need to acquire (consume) prestige goods motivated the intensification of local production and the extraction of a surplus, which provided goods for exchange.

What began as the provision of a limited quantity of high-value, low-bulk luxury goods (a minor part of total production in the Mediterranean) grew over time to incorporate the bulk-exchange of non-convertible commodities (e.g. the contents of Canaanite jars, Aegean and Cypriot textiles and pottery, Near Eastern glass and faience) locally produced in quantity for export on an interregional scale. In contrast, the real determinants of regional politico-economic power were convertible resources, especially copper ingots and metal goods, which were never actively marketed but instead subject to tight elite control and traded – perhaps exclusively – via formal gift-exchange procedures (S. Sherratt, pers. comm.; Knapp 1988). Exchange systems in the Mediterranean were in a continuous process of transformation, wherein consumer (or supplier) demand and maritime technology increasingly enabled regional exchange networks to be linked to a wider, common circulation system that moved commodities as well as high-value goods (notably metals) between participating units. Standardized values and mediated exchange rates facilitated interregional trade and in addition may have served as a stabilizing influence in the context of ever-changing politico-economic relationships. The (approximately) 30kg copper oxhide ingot – found from Babylonia in the east to Sardinia in the west (LoSchiavo et al. 1985: 10–13; Brinkman 1987: 35–6) – suggests a Mediterranean standard for value, weight and possibly context. The set of bronze and stone weights from *Ayios Dhimitrios* on Cyprus, a set of disk weights from Akrotiri on Thera, and the possible regional intercalation of measuring systems, suggest the likelihood of interrelated systems of weights and measures (Courtois 1983; Petruso 1984; Michailidou 1990).

The parameters for studying Mediterranean trade have often been unrealistically restricted, either to consideration of the production and distribution of a single type of artifact or else to basic lists of all exogenous goods in a given archaeological context and a comparative search for their likely origins (Perlès 1992). Based on the distribution of distinctive artifact types, it is conceptually useful to model the spatial extent of exchange systems (Renfrew 1975: 42, fig. 10); but the notion of 'central places', surrounded by progressively larger, more inclusive territories, is problematic in the Bronze Age Mediterranean, where several different types of trade activity overlapped with or cross-cut one another. For example, by the time a Cypriot pithos passed from its locus of production along Cyprus's south-central coast to its final, stratified, domestic context at the Sardinian port of *Nuraghe* Antigori (Vagnetti, in Ferrarese Ceruti et al. 1987: 17–19, fig. 2.5), it had

Downloaded by [UQ Library] at 19:18 02 November 2014

travelled through several modes of exchange, each of which could be considered separately or as part of an interregional Mediterranean system. Bronze Age ships and merchants also had to take into account several constraints: coastal currents and prevailing winds, offshore reefs and inshore rocks, the limited number of good ports (southern Levant and Egypt), piracy, taxation and duties (Kemp and Merrillees 1980: 269–71, fig. 78; Pryor 1988: 12–24; Altman 1988). Trading strategies, in other words, whether based on entrepreneurial initiative, the acquisition of prestige goods (and social status) or the maintenance of centralized politico-economic control, always involved specific cultural and individual human factors that must be incorporated into any generalized model of trade.

The functions of trade are manifold and range from the purely economic to the military, social and ideological. Trade brought luxury goods and prestige items to ruling elites; metals, precious and semi-precious stones and other raw materials (ivory, amber, wood) to craftspeople; subsistence supplies and basic commodities to rural peasants. Under the rubric of exchange, tribute moved up the social hierarchy whilst food and other surpluses moved down and out. Because prehistoric trade 'ran ahead' of strongly centralized polities (Webb 1975), the dynamic of power formation must lie at least partly in the 'tension between the market and the palace' (Kipp and Schortman 1989: 379). The transformative effects of trade upon social structures, politico-economic motivation or individual human need and action, may be profound, and participation in interregional trade systems may bring in its wake major structural or technological changes in society (Adams 1974: 244).

Nor are these transformations always productive. Once local leaders were drawn into wider spheres of interaction, they could not always control the effects of trade on socio-political organization or development (Kipp and Schortman 1989: 374–5). Luxury goods may serve as political or ideological 'currency' and enable elites to mobilize labour as well as an armed force, in order to provide or protect the surplus or specialized production that makes possible their participation in long distance exchange. Exploitation and dominance may also result directly from trade-related factors (Terray 1974). Trade, in other words, may be socially integrative or socially divisive (Foster 1977; Hodder 1980: 154). The agents of prehistoric trade are invisible and difficult to identify ethnically. Although entrepreneurship has received a good deal of attention in recent literature on exchange, the goal-motivated behaviour of elites deserves more emphasis, and it is essential to distinguish between broader, socio-cultural needs and objectives on the one hand and, on the other, the narrower motivations of human agents in acts of production and exchange (Earle 1989). Ethnographic and ethnohistoric data provide a dynamic element missing in many studies of ancient trade and make it possible to consider human roles, traditions, predations and motivations (Adams 1974: 242–3).

Conclusion

The most significant incentive for trade in the Bronze Age Mediterranean was the desire by emergent elites to acquire goods which had a specific social significance (Sherratt and Sherratt 1991). The structured demands of elites (legitimization, consolidation of power) necessitated the import of various goods that could only be acquired through the

Downloaded by [UQ Library] at 19:18 02 November 2014

production of certain other goods – raw materials such as metal, wood or ivory; finished products such as bronzes, textiles or decorated chests. As the Late Bronze Age palace-based economies of the Levant and the Aegean expanded, and Cyprus became a key supplier of metal and other commodities in demand, there was a quantum leap in the production and exchange of certain goods (Aegean and Cypriot pottery, glass products, copper ingots, metal artifacts). This implies a significant mobilization of labour and deployment of craft specialists, as well as a substantial reorganization of the political economy. Whereas the economies of the major polities would have become more tightly linked and structured around elite demands, the dynamics of production and exchange – as well as the fluctuating opportunities afforded by the social or legal systems – freed resources for entrepreneurial, if not socially disruptive, activities.

The individual human agent – or collective agents – and their material manifestation(s) had the capacity actively to transform society, not just reflect it. Entrepreneurial awareness operated in various public or private domains within a generally more structured, hierarchical, political economy. Common units of exchange, measuring systems or even an agreed-upon 'standard' of exchange (copper, silver) facilitated 'investments' in the productive means of society and allowed flexibility in the factors related to investment and the production of a surplus. A buffered market mechanism, in other words, wherein local trade and external demand provided a stimulus for politico-economic growth (Renfrew 1972: 473), and which revolved to some extent around the role of metals as media of exchange (Marfoe 1987: 31), must have operated at least periodically and at several key points within a Mediterranean regional sphere of interaction.

The mechanisms that propelled trade in such a system were diverse, complex, multidimensional and repeatedly in flux as different opportunities and distinctive products became available to the traders, raiders and entrepreneurs active in long distance exchange. The picture that emerges from detailed consideration of a diverse range of contemporary documentary evidence is fully consistent with such a multifaceted trade network (Zaccagnini 1987; Kemp and Merrillees 1980: 276; Portugali and Knapp 1985: 64–6; Liverani 1990). Renfrew's material view of Aegean-eastern Mediterranean trade in the second millennium BC similarly evokes diverse trading mechanisms: gift exchange, freelance trade, palace-based directional trade, redistribution, commercial-directional trade (1972: 472–3). Interregional trade was palace-centered in many respects, but the exchange process mobilized specific demand for import and export commodities, allowed sufficient scope for individual initiative within the system and stimulated a highly developed mercantile economy on the fringes of the 'command economy' (Sherratt and Sherratt 1991). Markets, after all, expand as aggressively as states or empires, and entrepreneurs will carry traded goods as far as they are able.

Acknowledgements

This study has benefitted considerably from the ideas and comments of Drs John F. Cherry and Susan Sherratt. Much of the research on which this study is based formed part of a major interdisciplinary project: *Science and Archaeology: Bronze Age Trade in the Aegean*

Abstract

Knapp, A. Bernard

Thalassocracies in Bronze Age eastern Mediterranean trade: making and breaking a myth

Interpretations of economic pre-eminence, ethnicity and directionality in Bronze Age eastern Mediterranean trade – e.g. Minoan or Canaanite thalassocracies, Egyptian supremacy – were formulated earlier in the twentieth century and remain intact despite accumulating evidence against such unilateral explanations. This paper examines critically such approaches, documents the existence of alternative trade mechanisms (local control, freelance trade, gift exchange) and presents another perspective intended to advance understanding of Mediterranean Bronze Age political and economic processes.

THE LEGEND OF CADMUS – The foundation of the city of *Butoa* and the possible origin of the name Illyrians

Apstrakt: Tokom stoljetnog razvoja arheološke znanosti na prostoru jugoistočne Evrope se kao jedno od dominantnih pitanja kontinuirano nametala problematika porijekla zajednica koje su raniji istraživači prepoznavali kao homogenu etničku komponentu nazivanu Iliri. Problem njihovog porijekla je promatran kroz različite interpretacije etnogenetskih procesa čime su brojni istraživači pokušavali kreirati različite razvojne etape formiranja zajednica koje su nazivali ilirskim imenom. Kombiniranjem novijih razumijevanja koncepta mitova i legendi u nekadašnjim zajednicama, pisanih podataka koji svjedoče o živom sjećanju na te mitove tokom protekla dva stoljeća, kao i arheoloških i historijskih podataka se nameće povezanost i kompleksna složenost najstarijih mitova i legendi, poput legende o Kadmu i Harmoniji, a koji ukazuju na porijeklo cjelokupnog pojma Ilira kao geografskog i religijskog koncepta u potpunosti dihotomnog u odnosu na, čini se, pogrešna tumačenja o širokom etničkom kompleksu prahistorijskog Balkana.

Ključne riječi: Kadmo, Harmonia, Butoa, Iliri, Mikenjani, prahistorija, trgovački putevi, legende, etnicitet

Abstract: During one hundred years of the development of archaeology in southeast Europe, one of the dominant issues was the origin of communities that were recognized by former researchers as a homogenous component named the Illyrians. The issue of their origin was observed through different interpretations of wethnogenetic processes which numerous researchers tried to use to create different developmental phases of creating communities named after the Illyrians. By combining the most recent interpretations of concepts of myths and legends of the past communities, written data containing live memories of these myths during the past two centuries, as well as archaeological and historical data, the relationship and complexities of the oldest myths and legends, such as the one of Cadmus and Harmonia, are reimposed as they suggest the origin of the entire term of the Illyrians as a geographic and religious concept entirely dichotomous compared to, seemingly, misinterpretations of the wider ethnic context of the prehistoric Balkans.

Keywords: Cadmus, Harmonia, Butoa, Illyrians, Mycenaeans, Prehistory, Trading routes, Legends, Ethnicity

The matters of history, origin, and development in the territory of the Western Balkans and elsewhere have been present ever since the prehistoric times when we can also date the earliest testimonies of classical authors who, in their own distinctive way, through numerous myths, strived for understanding and yet unattainable knowledge of the development of origin and identity of communities inhabiting this territory during the scientifically established historic periods. Just like to the development of modern science, this matter experienced an exponential progression and, at a certain moment of the history of science in this territory, it occupied one of the most important matters of archaeology and historiography of the 20th century.[1]

Beginning from the time of the Illyrian movement and Ljudevit Gaj, when the approach to this matter was focused on the idea of providing evidence for the indigenous origin of the Western Balkan peoples, the interest of scholars has not decreased in intensity until modern times. Thus J. G. v. Hahn wrote back in 1853 on the origin of the Illyrian name and its earliest form "Ιλλυριοί, Hilurii, and Hiluricus".[2] In his book *Through Bosnia and the Herzegovina on Foot During the Insurrection, August and September 1875*, Arthur Evans wrote multiple overviews on the associations with the Greek world.[3] The first issue of the Herald of the National Museum of Bosnia and Herzegovina (*Glasnik Zemaljskog muzeja Bosne i Hercegovine*) in 1889 and the paper titled *О значењу имена "Босна"* have not left out this matter, in which the author Lajos Thallóczy reflected on the writings of classical authors regarding the "Illyrian" peoples.[4] In the same issue of the Herald, Ćiro Truhelka concluded his paper *Gromile na Glasincu*[5] with the following words: "*Nema sumnje da je ta umjetnost iz Grčke prešla ostalim balkanskim narodima, a uzme li se u obzir da se grčka kultura baš na Balkanu sporo širila, to možemo po tome suditi da glasinačke gromile nijesu davno prije našeg doba nastale*",[6] alluding that the former communities in this territory are young by date and that they had established contacts with the Greek world. The interest of the first explorers did not lose its intensity during the later period when these matters were made topics of papers of authors, citing only some of them, such as G. Novak, P. Lisičar, D. Rendić-Miočević, R. Katičića, B. Govedarica, M. Parović-Pešikan, M. Šašel Kos, and numerous others. From classical philologists to archaeologists, numerous authors reflected on the words of classical authors and prehistoric myths and legends on the arrival of Greek heroes at the coast of the Adriatic Sea by observing, or at least trying to observe, the earliest history through the eyes of the ancient Greeks. Following Nietzsche's idea that a modern man cannot find a *way out of a millennium-old*

[1] This text is a result of a multi-year research and parts of it were presented on the scientific conference "Dani antičke Budve" in Budva in 2018.

[5] Truhelka 1889, 35.

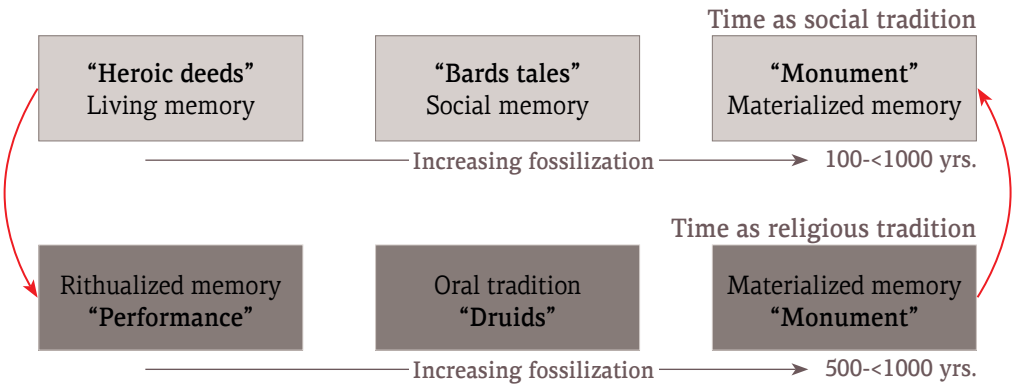
[6] Ibid, 35

labyrinth, the aspiration of explorers became irreversibly focused on understanding the time of mythical events in the eyes of an ancient man and his words. Unfortunately, the enigma remains unsolved and it is difficult to assume that the absolute solution to this problem will be found in the near future even though it is almost impossible to single out a 20th-century author from the Western Balkans who has not addressed the issue of genesis and the relationship with the Aegean civilization throughout their career.

By approaching the problem through the paradigm of a cultural and historic approach, scholars have achieved a certain consensus by defining the period of the end of the Bronze Age and the earliest Iron Age as *terminus post quem* of forming the identity of Western Balkan communities. It seems that one of the fundamental reasons why archaeologists from the second half of the 20th century made such a chronological formula is the fact that the Iron Age produced documents containing the oldest mention of the communities in the territory of former eastern Adriatic coast, familiar to ancient Greek sailors who sailed there during the Archaic Period and Classical Greek Period, but also earlier, searching for places of future *emporia* and *apoikia*. Although anticipated by earlier authors, the moment of the first mention, or the earliest preserved mention today, in theory does not represent the moment when communities were actually formed, and we can assume that the local identities had existed much earlier dependent on geographical, communication, linguistic, and other conditions. This raises some fundamental methodological questions, particularly the problem of the relationship between mythological traditions and actual events, mechanisms for verifying them, and realistic grounds for including the usage of written words of classical authors in combination with empirically defined disciplines such as archaeology. We should note the fact that despite the so-called empiricism of archaeology, cultural and identity determinants of archaeology itself showed just as much weakness focusing exclusively on "interpretations" by artificially creating terms such as "archaeological cultures", "individual cults", or the so-called "princes" whose titles within a collective are exclusively from the pens of the archaeologists themselves. At the same time, it is undeniable that modern science and modern man perceive space and spatial distributions entirely differently from classical man. This is precisely where the truth lies that, unlike modern archaeologists and graphical depictions, the ancient Greeks used to define and present spatial characteristics by using written media and spoken words.[7] Unlike graphical perception, the written and spoken words could be manifested in beliefs and myths that were comprehensible only to people living at that point of time. In the spirit of the aforementioned hypothesis, we are faced with an issue of the relationship between mythology and reality whereby one of the central problems is a continual mythological representation of heroes who were allegedly founders and conquerors, ancestors, demigods, gods. Opinions are extremely divided over the interpretation of the mythological past, and certain authors, such as

[7] Babić 2007, 73-89.

J. G. Frazer, believe that a myth is a product of human imagination entirely disassociated from reality. On the other hand, he believes legends to be reminiscences of actual events, heroes, and occur at actual historical sites.[8] Furthermore, by observing memories as a long-term process starting from the works represented as heroic to the materialization of memories, Kristiansen points out two types of fossilization and materialization of memories: social and religious tradition.[9] At the same time, he believes that the process from actual characters and events to materialized memory would occur in a different developmental period from 100 to 1000 years.[10]



Ill. 1. The process of fossilization of memories through time by Kristiansen (Author: A. Kaljanac)

Starting from the assumption that the materialization of memories in the form that is comprehensible to younger generations is a long-term process, the question arises to what extent it is recognizable to modern researchers. Following the time range proposed by Kristiansen, the hero from Sidon – Cadmus – should have attained the status of a legend about one thousand years after his lifetime. For now, judging from the archaeological findings such as the amphora from Euboe dated to 560 – 550 BC, much earlier than Herodotus[11] and according to the data from the Parian Marble[12] or the intriguing appearance of the work of Sophocles *Oedipus Tyrannus* (Οἰδίπους Τύραννος) Herodotus's *History* appears almost simultaneously, we can conclude that there were older data that can be dated to the Iron Ages, that preceded to the origin of Herodotus's *History*. Therefore, we can assume that the Bronze Age is the initial point of observation when certain events took place that materialized in writing and probably in art one millennium later. The fundamental question as the basis of this premise is whether it was possible, in the

period of human history that preceded the modern way of recording and transferring knowledge about it, to actually maintain a realistic memory of a certain person?

Ill. 2. A depiction of Cadmus killing a snake – dating to the period of around 560 to 550 BC (https://collections.louvre.fr/en/ark:/53355/cl010268302 [last checked 2021-5-28])

First of all, we need to weigh out the amount of available knowledge as well as its comprehensibility to the wider community, more precisely whether there were adequate mechanisms of transferring the necessary information. For this reason, information transferred from local and foreign authors are deemed fascinating information and examples. The 11th issue of the journal named *Bosanski Vjestnik* (Bosnian Herald), established by Ignjat Sopron in 1866, published a series of interesting data regarding the life of hero Cadmus. The text notes the following:

> «Од старог Дубровника води друм кроз каналску долину, која је прилично плодовита, па онда кроз турску област Суторину у Кастелново на Которском каналу. Овај друм пружа се од Дубровника неколико простора поред обале бренског залива, која је овдје ниска и има једну пећину, која се зове Ескулапова... Тако се прича, да је у њој у прастара времена Ескулап, бог видарства становао... После је краљ Кадм, оснoватељ вароши Тебе, кад је ову због несреће своје дјеце или ко што други веле, за то оставити морао, што

није хтјео Бакха као Бога поштовати, овдје се доселио и код Енхелеа, који су овдје становали, прибјежиште нашао, па с помоћу ових Илире побједио. Па је у тој пећини, прича се даље, исти краљ Кадм, у једној грдно великој школьки бању начинио и купао се. У сусједству те пећине звало се једно брдо код старих Мона Кадеј....."[13]

Similarly, Arthur Evans presents the information regarding the memory of the legend of Cadmus, nine years after the publication in Bosanski Vjestnik, describing the beliefs and traditions associated with the belief and veneration of serpents among the residents of Cavtat and Konavle even in 1875 when they showed "*Asclepius's*" cave where Cadmus and Harmonia were turned into serpents.[14]

Looking back at the idea of Kristiansen and the process of fossilization and materialization over a period of up to one thousand years, and judging by the aforementioned and similar examples shared by numerous travel writers from the 19th century, we can say that the citizens of the eastern Adriatic coast, including present-day Montenegro, harbored a memory of ancient myths and legends and awe at the creatures and cults from these legends. Thus, the materialization of memories does not mean the end of the overall process but an end of fossilization and the establishment of a clear structure and form of a myth that becomes part of the future tradition of usage.

On the other hand, compared to classical archaeological observation and modern dissociation of archaeological science from the problem of identity, vivid memories represent an undefined space between conditionally named and artificially construed archaeological cultures as specific determinants and the question of authentic identification of past communities. Identity or *ethnos* as one of the objects of archaeological pursuit ever since the 1960s within *'western' social scientific traditions* has been viewed as a *self-defining system* and certain communities have been defined, in ethnic terms, as self-identified or identified by others.[15] It is a common belief that culture is the first and fundamental factor. Culture contains numerous spiritual and material elements and, according to the definition of S. Jones, its reflection in social and psychological phenomena of collective identity is regarded as the leader of ethnic affiliation.[16] However, in its overall form, culture does not have the ability to survive over time, and going through numerous transformations, just like archaeological artifacts themselves, it gradually fragments into parts that are passed on to modern explorers as such. In line with this assumption, as well as the fact that culture cannot survive through time, there is a statement of J. M. Hall that culture, along with language and alike, despite its apparent importance, is not the defining element of identity.[17] According to him and previously mentioned facts,

[13] Bosanski Vjestnik 1866, 88.

[17] Hall 2002, 9.

the decisive factor can be considered elements of mythology, origin, genders, and their connection with a specific territory.[18] In the spirit of this hypothesis we can observe the conclusions of L. S. Klejn who suggested that culture is *kot sistem sredstev za družbeno programiranje človeškega delovanja in vedenja, ki ga vsakemu posamezniku posreduje njegova družba*, while on the contrary, archaeological culture is *Sama v sebi je statična in ne organska... pogojno dinamični sistem.*[19] Following these ideas, we can distinguish two forms of culture: general or vivid and fragmented. The first form of culture represents all of its elements from language to spirituality, whereas the latter one represents the fragments of vivid culture into two spheres. The first fragmentation sphere is the one that took place at the time the culture existed whereby it was divided into elements of material and non-material, non-material but materialized through records, religion and rituals, communication, identity and alike that, through itself, manifested different parts of a wider unit within daily lives of the community. The second sphere is defined by the process of entry of fragments, such as material remains, into time fragmentation whereby one segment of living culture, such as a ceramic product that materialized only one segment of living culture, is additionally fragmented through the flow of time until the moment of discovery. By making such observations, archaeological fragments of a cultural fragment of living culture represent a part of the wider unit in symbiosis with similar fragments of preserved texts of classical authors, myths, and legends that represent fragmented remains of fragments of a former living culture. Ultimately, by observing from a distance, the written materialization of the verbal sphere of living culture through fragmentation of author's subjectivity or temporal fragmentation and poorly preserved state of ancient texts represents an equivalent of materialized fragmentation whereby the work of a ceramist has fixed individual fragments of culture that subsequently underwent additional temporal fragmentation. Thus, as already mentioned by L. Binford, unlike historical data and author manipulation, archaeological remains are silent even when discovered,[20] so it seems that their interpretation is a "Sisyphean task", as well as the interpretation of thoughts and meanings of words of the author who lived several millennia before.

Although modern archeology has made a significant turning point in examining its own ideas in the past while focusing on interdisciplinarity, we get the impression that there is a selectivity in this approach, and that earlier achievements and methods, with a potential of being used in modern observations, were considerably neglected. In the first place, by establishing the previously noted fact of S. Jones that ethnic identification makes a community identify itself as different from another community or that another community identifies it as such[21], implies determining self-perception and perception of

[18] Ibid, 9.

[19] Klejn 1988, 327-328.

[20] Binford 2002, 19-23.

[21] Jones 1997, 84.

former communities as opposites of their perception in the eyes of modern researchers. In this regard, as a textual materialization of a verbal and intellectual segment of a living culture, myths and legends, heroes, distant lands and oceans between them, as well as how they were understood by the author who created them and wrote them down, represent a collective identification with a territory where future cities were formed, with countries and landscapes, the past where heroic ancestors lived, where they themselves will live one day, because their longevity is the proof that they were not created or remembered for individuals nor represented, often mistakenly, only heroic individuals. Their names, the names of their ancestors and founders, conceal the lives of their communities who, even long after, were proud to express their past and mythical heroes. Could this be a historic manipulation and collective construction of the past or an actual reality of self-perception for the man of that time as much as it is a mythical non-reality for the modern man?

Reflecting on the issue of self-identification and identification, one of the fundamental imposed questions is the ability of understanding and achieving a realistic knowledge of the perception of collective identities of past communities. Elements such as history, ancestors, genealogy, ancient knowledge, and traditions were, without doubt, very important for them and their collective consciousness. In the territory of the eastern Adriatic coast, the legend about legendary heroes Cadmus and Harmonia thus played an important role in the mechanism of self-identification until the times when the memories of the inhabitants of Cavtat and Konavle were described in Bosanski Vjestnik in 1866 or until the writings of Appendini[22] and Evans. Already in 1866, these memories reached the legendary tradition on the arrival of Cadmus, the founder of Thebes in the territory of Boeotia, as well as the founder of Butoa, sometimes named Buto or Butho[23], present-day Budva, and the personality that remained a part of the long-term memory in the wider territory of the southern part of the eastern Adriatic coast. The memory and conscience of mythology of the distance past certainly had a long tradition of transformation and usage during the Middle Ages and beyond,[24] especially since the period until the development of archaeology, in the second half of the 19th century, largely depended on the written source material.[25] In this regard we need to emphasize that the past itself, its fragments, and myths that that have survived until the modern times were significantly modified depending on social, political, and social circumstances,[26] thus implying their different interpretation, reconstruction, and usage in the period until the 19th century.

[22] Appendini 1802.

[23] Given the number of different names used for present-day Budva, the term Butoa will be used hereinafter..

[26] Ibid, 21.

According to a legend that was recorded in its present-day form centuries after the events of the legend, Cadmus was born as a son of Sidonian king Agenor and his wife Telephassa. He spent the first part of this life in Sidon with his brothers Phoenix, Cilix, Tasus, and sister Europa who forever changed our lives. After Zeus abducted Europa, Cadmus launched a search with his brothers and, according to the instructions of the Oracle of Delphi, ultimately found a city at a resting place of a cow with a white spot on her forehead which was never put into a yoke. Unfortunately, the place chosen by a cow to be the new settlement at the very beginning propelled several unfortunate circumstances that shaped the destiny of Cadmus and his future wife Harmonia. Cadmus was forced to confront a serpent that killed his followers and killed it not knowing that it was the serpent of the god of war – Ares. With the help of soldiers who emerged from the serpent's tooth that Cadmus sowed, he erected the walls of Cadmeia, later known as Thebes, with seven doors. During his reign in Cadmeia, he married a woman chosen by the very gods, Harmonia, the daughter of god Ares and goddess Aphrodite, but nevertheless, Ares never forgave him for killing his sacred serpent. Although not a popular figure among the gods, the Sidonian hero was a victim of injustice many times during his lifetime, when Artemis killed his grandson Actaeon, and he lost his daughters Semele and Ino because of goddess Hera. Following these events, apart from numerous other misfortunes, together with Harmonia, Cadmus left Thebes and moved far north, to "Illyria" according to some, or among the Encheleans, according to others, where he and his wife ultimately ended their legendary travels and lives by turning into serpents that in the centuries to come continued to remind local inhabitants of the legends of Sidonian hero Cadmus and his wife Harmonia, the founders of Butoa.

It is difficult to determine the level of historical truth in this legend of the arrival of Cadmus from Sidon to Boeotia and the foundation of Cadmeia. Details referring to the question of the entire origin of the tradition of Cadmus and his deeds, especially the foundation of Butoa his role in this territory, and the influence on local communities, are just as equally fragmented in historical as well as archaeological problems. In keeping with this, following the tradition of these events, the origin of the tradition can be partially traced through fragmented data contained in the works of classical authors who wrote of Cadmus's passage through Greece.

On several occasions, Herodotus wrote of Cadmus and his arrival in the territory of Greece much earlier than famous Ovid's Metamorphoses. Describing the festivity in the honor of the god Dionysus, Herodotus wrote the following regarding the origin of this cult: "*Nor yet will I hold that the Egyptians took either this or any other custom from the Greeks. But I believe that Melampus learnt the worship of Dionysus chiefly from Cadmus of Tyre and those who came with Cadmus from Phoenice to the land now called Boeotia*".[27]

[27] Hdt.s 2.49: Οὐ μὲν οὐδὲ φήσω ὅκως Αἰγύπτιοι παρ' Ἑλλήνων ἔλαβον ἢ τοῦτο ἢ ἄλλο κού τι νόμαιον. Πυθέσθαι δέ μοι δοκέει μάλιστα Μελάμπους τὰ περὶ τὸν Διόνυσον παρὰ Κάδμου τε τοῦ Τυρίου καὶ τῶν σὺν αὐτῷ ἐκ Φοινίκης ἀπικομένων ἐς τὴν νῦν Βοιωτίην καλεομένην χώρην. English translation A. D. Godley.

By mentioning the information that Cadmus arrived in the Greek territory together with a group of Phoenicians as an already well-known information, while making an overview of the Gephyraean clan in another place, Herodotus gives considerably more information regarding this fact and the appearance of Cadmus, together with the Phoenicians, in the territory of Boeotia: "*Now the Gephyraean clan, of which the slayers of Hipparchus were members, claim to have come at first from Eretria, but my own enquiry shows that they were among the Phoenicians who came with Cadmus to the country now called Boeotia. In that country the lands of Tanagra were allotted to them, and this is where they settled...These Phoenicians who came with Cadmus and of whom the Gephyraeans were a part brought with them to Hellas, among many other kinds of learning, the alphabet, which had been unknown before this, I think, to the Greeks.I have myself seen Cadmean writing in the temple of Ismenian Apollo at Thebes of Boeotia engraved on certain tripods and for the most part looking like Ionian letters*".[28]

The tradition that spoke of the Gephyraean clan from Herodotus's description can be found in the 19th book of Strabo's *Geography*: "*Near Orpus is a place called Graea, and also the temple of Amphiaraus, and the monument of Narcissus the Eretrian, which is called "Sigelus's", because people pass it in silence. Some say that Graea is the same as Tanagra. The Poemendrian territory is the same as the Tanagraean; and the Tanagraeans are also called Gephyraeans. The temple of Amphiaraus was transferred hither in accordance with an oracle from the Theban Cnopia*".[29] According to Herodotus, the Gephyraeans settled in Tanagra and although they were afterwards named the Tanagraeans, according to Strabo, they were known by the same name centuries after Herotodus's description and interpretation of their origin. Pausanias also notes similar information that Cadmus came to Boeotia accompanied by a large number of Phoenicians, which is why it is possible to

[28] Hdt.s 5.57-59: Οἱ δὲ Γεφυραῖοι, τῶν ἦσαν οἱ φονέες οἱ Ἱππάρχου, ὡς μὲν αὐτοὶ λέγουσι, ἐγεγόνεσαν ἐξ Ἐρετρίης τὴν ἀρχήν, ὡς δὲ ἐγὼ ἀναπυνθανόμενος εὑρίσκω, ἦσαν Φοίνικες τῶν σὺν Κάδμῳ ἀπικομένων Φοινίκων ἐς γῆν τὴν νῦν Βοιωτίην καλεομένην, οἴκεον δὲ τῆς χώρης ταύτης ἀπολαχόντες τὴν Ταναγρικὴν μοῖραν· Ἐνθεῦτεν δέ, Καδμείων πρότερον ἐξαναστάντων ὑπ' Ἀργείων, οἱ Γεφυραῖοι οὗτοι δεύτερα ὑπὸ Βοιωτῶν ἐξαναστάντες ἐτράποντο ἐπ' Ἀβνέων· Ἀθηναῖοι δέ σφεας ἐπὶ ῥητοῖσι ἐδέξαντο σφέων αὐτῶν εἶναι πολιήτας, <οὐ> πολλῶν τεων καὶ οὐκ ἀξιαπηγήτων ἐπιτάξαντες ἔργεσθαι. Οἱ δὲ Φοίνικες οὗτοι οἱ σὺν Κάδμῳ ἀπικόμενοι, τῶν ἦσαν οἱ Γεφυραῖοι, ἄλλα τε πολλὰ οἰκήσαντες ταύτην τὴν χώρην ἐσήγαγον διδασκάλια ἐς τοὺς Ἕλληνας καὶ δὴ καὶ γράμματα, οὐκ ἐόντα πρὶν Ἕλλησι ὡς ἐμοὶ δοκέειν, πρῶτα μὲν τοῖσι καὶ ἅπαντες χρέωνται Φοίνικες· μετὰ δὲ χρόνου προβαίνοντος ἅμα τῇ φωνῇ μετέβαλον καὶ τὸν ῥυθμὸν τῶν γραμμάτων. Περιοίκεον δέ σφεας τὰ πολλὰ τῶν χώρων τοῦτον τὸν χρόνον Ἑλλήνων Ἴωνες· οἳ παραλαβόντες διδαχῇ παρὰ τῶν Φοινίκων τὰ γράμματα, μεταρρυθμίσαντές σφεων ὀλίγα ἐχρέωντο, χρεώμενοι δὲ ἐφάτισαν, ὥσπερ καὶ τὸ δίκαιον ἔφερε ἐσαγαγόντων Φοινίκων ἐς τὴν Ἑλλάδα, φοινικήια κεκλῆσθαι. Καὶ τὰς βύβλους διφθέρας καλέουσι ἀπὸ τοῦ παλαιοῦ οἱ Ἴωνες, ὅτι κοτὲ ἐν σπάνι βύβλων ἐχρέωντο διφθέρῃσι αἰγέῃσί τε καὶ οἰέῃσι· ἔτι δὲ καὶ τὸ κατ' ἐμὲ πολλοὶ τῶν βαρβάρων ἐς τοιαύτας διφθέρας γράφουσι. Εἶδον δὲ καὶ αὐτὸς Καδμήια γράμματα ἐν τῷ ἱρῷ τοῦ Ἀπόλλωνος τοῦ Ἰσμηνίου ἐν Θήβῃσι τῇσι Βοιωτῶν ἐπὶ τρίποσι τρισὶ ἐγκεκολαμμένα, τὰ πολλὰ ὅμοια ἐόντα τοῖσι Ἰωνικοῖσι. English translation A. D. Godley.

[29] Strabo, 9.2.10: Καὶ ἡ Γραῖα δ' ἐστὶ τόπος Ὠρωποῦ πλησίον καὶ τὸ ἱερὸν τοῦ Ἀμφιαράου καὶ τὸ Ναρκίσσου τοῦ Ἐρετριέως μνῆμα ὃ καλεῖται Σιγηλοῦ, ἐπειδὴ σιγῶσι παριόντες· τινὲς δὲ τῇ Τανάγρᾳ τὴν αὐτήν φασιν· ἡ Ποιμανδρὶς δ' ἐστὶν ἡ αὐτὴ τῇ Ταναγρικῇ· καλοῦνται δὲ καὶ Γεφυραῖοι οἱ Ταναγραῖοι. ἐκ Κνωπίας δὲ τῆς Θηβαϊκῆς μεθιδρύ[θη κατὰ χρησμὸν] δεῦρο τὸ Ἀμφιαράειον.

trace the continuation of tradition regarding these events. According to his words, a group of newcomers was even prepared to come into conflict with local communities. "*When the Phoenician army under Cadmus invaded the land these tribes were defeated; the Hyantes fled from the land when night came, but the Aones begged for mercy, and were allowed by Cadmus to remain and unite with the Phoenicians*".[30] Therefore we can conclude that the existing tradition recorded events as occurrences of not only Cadmus as a historic figure but of a larger group of immigrants from the coast of eastern Mediterranean who, following initial conflicts and making contacts, settled the region of Boeotia in the newly founded city of Cadmeia. One of these groups was allegedly the Gephyraeans, later known as the Tanagraeans who taught the Greeks how to use the alphabet. It is an intriguing fact that the Phoenician alphabet spread across the Mediterranean, including Greece[31], but this process took place until the 8th century BC, almost three decades before Herodotus›s "The Histories" where he had written down this tradition. On the contrary, as already noted in the 19th century by Friedrich August Wolf, Homer and Hesiod would have been illiterate at the moment of writing their works. As a matter of fact, Hecataeus, Herodotus's precursor, also corroborates the fact that the link between the Gephyraeans, as the citizens of Tanagra, and their name the Tanagraeans was older than their mention in Herodotus's works in the 5th century BC. According to Stephanus of Byzantium, the Gephyraeans were mentioned as the Tanagraeans precisely in Hecataeus›s work: "*Gephyra, a town in Boeotia. Some say that they are the same as the Tanagraeans, such as Strabo and Hecataeus. Thus, Demetra s also called the Gephyraean*".[32]

However, if we are to believe in the accuracy of the available information, this process could be shifted farther in the past, even until the downfall of the Mycenaean world and the events represented in Homer's epic poems. Dictys Cretensis who wrote "*Dictys of Crete, the chronicle of the Trojan War*" in six books, as one of the works from this period, also corroborates the fact that the Greeks did in fact learn the alphabet from the Phoenicians. According to Lucius Septimius, who professes to have translated this work, Dictys Cretensis was a contemporary and comrade of Idomeneus and Meriones, the Cretans who fought at the walls of Troy in the army of the Achaeans. According to Lucius, more precisely the letter he sent to Quintus Aradius Rufinus, clay plates were found after the earthquake on Crete, allegedly in his grave and fell into the hands of a certain Praxis or Eupraxides who translated them into Greek. Lucius translated the text from Greek into Latin emphasizing that Dictys was fluent in the Phoenician language and alphabet which Cadmus brought to Achaea.[33] The first book of this piece of work describes the

way of selecting Agamemnon as the leader of all Greeks in the campaign against Troy. On this occasion, Dictys wrote that, when casting ballots, the Achaeans wrote the name of the future leader on clay plates in the Phoenician alphabet: *Then they decided to appoint a commander-in-chief. Accordingly, in the temple of the Argive Juno, everyone, having received a ballot, wrote (in Phoenician letters) the name of the man he thought would make the best leader.*[34] Given the information available from this piece of work and the description, we can assume that the Achaeans, who fought beneath the walls of Troy, had already in this period used the letter which was not directly Phoenician but, in the worst case, influenced by it. Thus, the tradition on the arrival of the Phoenicians and the famous Sidonian hero in the territory of Greece could be pinpointed to the Bronze Age, although precise chronological determinants are impossible to obtain based on this tradition.

If we consider the fact that the tradition on the origin of the Greek letter has survived for more than a millennium and that it was kept by classical authors as such, we can justifiably question the accuracy of some other asserted information. In this regard, particularly important is Herodotus's mention of the Gephyraeans, of those Phoenicians who settled in Boeotia together with Cadmus, which implies other members of this group speaking that the Gephyraeans were in fact only a portion of Phoenicians who taught the alphabet to the Greeks. The source of Herodotus's information that could additionally shed light on this matter remains unknown and it is impossible to prejudge how Herodotus came to this information. We can confidently claim that this information is older than his time and it probably dates back the time of oral tradition and cults, such as the cult of ancestors, as the means of identification since such a mechanism would require preservation of the past in the cult of ancestors. Additionally, the information that Herodotus speaks of was familiar, in some segments, to his predecessor Hecataeus. This is distinguishable in the previously noted work of Stephanus of Byzantium which preserves the information that proves that Hecataeus himself wrote about the Gephyraeans as the Tanagraeans. Hecataeus's words of the city of Gephyra in Boeotia indicate a significantly older tradition than Herodotus and younger authors, as well as the fact that already during his time Gephyra got other names as well, implying an existing process during the previous period, which certainly requires time, so already much earlier than Hecataeus's time, Gephyra could have become Tanagra from a younger tradition on the timeline. Etymological manual, "*Etymologicum magnum*", corroborates other names for Gephyra, indirectly pointing out the fact that other authors might have used a different term or that it is perhaps a long-term process of many transformations of the name: Gephyra, Tanagra, Greja, and Poimandria.[35] Finally, Thucydides also confirms the fact that numerous presently unknown authors offered evidence regarding these events.

[34] Dictys Cretensis, Testimonia, FGrH 49.1A, 273-275.; book I, 16.

[35] Etym. Magn. 228.59-229.1-4. <Γέφυρα>: Πόλις Βοιωτίας, ἡ καὶ Τάναγρα καὶ Γραῖα καὶ Ποιμανδρία καλουμένη. Εἴρηται, ὅτι ἐν Σχεδίᾳ κώμῃ κατοικοῦντες, καὶ ἐν τῇ πέραν γῇ τοῦ Ἀσωποῦ, διὰ τοῦ χειμῶνος ἐν ταῖς πρὸς ἀλλήλους ἐπιμιξίαις γεφύραις ἐχρῶντο.

According to information available to Thucydides but not to other preserved authors, the Boeotians settled in the territory of Boeotia following the Trojan War, and until then, this territory had been named the land of Cadmus, and not Boeotia.[36] Thucydides's date certainly makes sense when considering the linguistic side of the problem given that we've already pointed out the fact that the familiarization with the Phoenician letter must have been accomplished before the 8th century BC.

If we take into consideration the assumption that the background of the memory of the past and the tradition of Cadmus's arrival in Greece is a Pre-Homeric age, and that the legendary leader brought with himself a larger and military capable group that could defeat the local population, as indicated in source data, it brings up a question of the nature of processes that took place, as well as the nature of Cadmus himself as the central figure strongly positioned in the consciousness of future generations. It seems inherent to assume that this was the matter of strengthening the colonization processes, and that, at that moment, the Phoenicians made a step towards establishing and spreading their influences across the Adriatic Sea and the Balkans. On one hand, the foundation and survival of the colony were secured through military means to certain limits, almost undoubtedly never until the complete annihilation of the indigenous element. On the other hand, as noted a long time ago by P. Lisičar, it was inconceivable that the inhabitants of any Greek colony on the Adriatic coast were pure Greeks,[37] in reality, even in the case of the arrival of Cadmus, we can address the problem in terms of mutual influences. According to Herodotus, when speaking of the Gephyraeans who came with Cadmus, the process of colonization can be perceived through the fact that the land was allotted to them for settlement in the land of Tanagra by "tossing a coin": "*because this land was allotted to them*"[38]. First of all, this information implies the existence of other communities since the land was allotted, while elsewhere it suggests actions such as determination and distribution which were well known and attested within the Greek colonization. On the other hand, we should not forget prominent words of Pausanias who confirmed conflicts with the local population, the Aones and the Hyantes, which were the first who finally joined the immigrants and continued to coexist,[39] so this information should be considered within the context of Lisičar's findings and colonization processes. Finally, surrounding towns, such as Orchomenus, are another indicator of internal relations, since their position suggested the defense from Thebes until the end of the Late Helladic IIIB period, by means of a series of forts directly connected with Thebes. This city protected the route from the Corinthian Bay to Euripus Strait, that separated Euboea from

[36] Th. 2.12: Βοιωτοί τε γὰρ οἱ νῦν ἑξηκοστῷ ἔτει μετὰ Ἰλίου ἅλωσιν ἐξ Ἄρνης ἀναστάντες ὑπὸ Θεσσαλῶν τὴν νῦν μὲν Βοιωτίαν, πρότερον δὲ Καδμηίδα γῆν καλουμένην ᾤκισαν (ἦν δὲ αὐτῶν καὶ ἀποδασμὸς πρότερον ἐν τῇ γῇ ταύτῃ, ἀφ' ὧν καὶ ἐς Ἴλιον ἐστράτευσαν).

[39] Paus. 9.5.

Boeotia.[40] S. Symeonoglou believes that Cadmus was a Phoenician or even Canaanite who set forth to conquer Phoenician colonies in south-east Europe from the east across Crete and the Cyclades and concludes that the Phoenicians arrived in Greece together with Cretan and Cycladic Minoans.[41] Therefore, it is probably a justifiable hypothesis that the Gephyraeans were, as Herodotus notes as well, "*one of those Phoenicians who came with Cadmus*" which raises a question about the remaining members of this group and their ultimate influence in this region.

According to the preserved tradition, at least in the form preserved by renowned mythographer Pseudo-Apollodorus, Cadmus left Thebes with his wife Harmonia and went to the north, to the distant Encheleans: "*But Cadmus and Harmonia quitted Thebes and went to the Encheleans. As the Encheleans were being attacked by the Illyrians, the god declared by an oracle that they would get the better of the Illyrians if they had Cadmus and Harmonia as their leaders. They believed him, and made them their leaders against the Illyrians, and got the better of them. And Cadmus reigned over the Illyrians, and a son Illyrius was born to him*".[42] Unlike Pseudo-Apollodorus, Diodorus Siculus informs us that Cadmus and his city were attacked by the Enchelean after which he retreated to the north to the Illyrians: "*Be that as it may, these people then settled in the city but later the Encheleans defeated them in war and drove them out, at which time Cadmus and his followers also were driven to Illyria*".[43] According to this information, one thing is certain, at the moment when Cadmus appears at the far north of the eastern Adriatic coast, history witnesses the appearance of the Encheleans, either as allies or opponents, traditionally believed to be one of the eldest and earliest communities of the Western Balkans with whom the old Greeks first established contacts. We learn the earliest information about them from the writings of Hecataeus and everything that Stephanus of Byzantium had transferred from his text when speaking of the Dexaroi, the people of Chaonia: "*The Dexaroi, the Chaonian people,*

the neighbors of the Encheleans, as Hecataeus writes in the description of Europe. They dwell under the mountain Amyron".[44] The question of whether the Dexaroi are in fact the Dassaretae and whether the mountain Amyron is Tomorr in Dassaretis, as referred to by R. Katičić,[45] has never been answered in its entirety, thus it is difficult to locate their neighbors the Encheleans. The widest interpretation of this issue includes the assumption that the Encheleans were the leaders of the Ohrid culture from Trebenište.[46] However, a more detailed overview of other classical authors further complicates this issue given the relatively large number of data suggesting that the Encheleans settled in the area of Boeotia, and that they suddenly appeared in the north during the events describing the appearance of Cadmus in this region.[47] On the other hand, their role in these events was evidently crucial and, at the same time, it manifested on all future traditions, so their name survived as one of the oldest known peoples to this day.

When observing the data about this community presented by Hecataeus, we observe an important fact that these Hecataeus's Encheleans are found in the south, in the territory of the eastern Adriatic coast. However, as already mentioned on several occasions, in accordance with the hypothesis that apart from the Gephyraeans other groups that took part in the events regarding Cadmus's conquest of the settlement Cadmeia in Boeotia[48], it seems that the Encheleans participated in the spread of the impacts of colonization of the Phoenicians themselves or from Boeotia from Greece. Although the news transferred by Stephanus of Byzantium from Hecataeus is the oldest preserved data about the Encheleans, numerous authors after Hecataeus used the same tradition and today unknown sources used by Hecataeus himself. One such work was created by Hellanicus of Lesbos, a logographer from the 5th century BC. When writing about the past of Boeotia (Βοιωτιακα), given that during Hecataeus's time they were no longer there, he mentions the Encheleans as ancient inhabitants of Boeotia: "*There are very large eels in lake Kopais. And Boeotia was inhabited by the peoples named the Encheleans, mentioned by Hellanicus in his book of Boeotia*"[49]. This information is identifiable and can be understood as much earlier tradition that preceded Hecataeus during the time when the Encheleans had long since become Hecataeus's Encheleans, the neighbors of the Dexaroi. Hellanicus is not the only author who mentioned the Encheleans in Boeotia. In his work Βιβλιοτηκη ῾ιστορικη, Diodorus Siculus mentions the arrival of the Encheleans who attacked and conquered Cadmeia.[50] Apart from Hellanicus and Diodorus Siculus, the

Encheleans in Boeotia are also mentioned by other authors such as Cephalion referred to by John Malalas when speaking about how Amphion and Zethus constructed the walls of Thebes at the place of an earlier settlement Enchele.[51] John of Antioch provides similar information speaking of how the sons of Calliope, Amphion, and Zethus had built the city of Euthalia (ΕυΘαλειαν).[52] All of this can certainly be associated with Boeotian Encheleans and we can conclude that their presence in Boeotia is a mystery even for classical authors. This produces two statements: (1) as previously stated, Cadmus, the Gephyraeans, and unnamed communities with whom the Gephyraeans used to allot the land, represented the leaders of the process of colonization of the Phoenicians, and (2) these events reveal older traditions preceding Homer and Hecataeus up until the Trojan War, according to some authors, which certainly does not exclude even the earlier period.

In the context of these presumptions, regardless of various differentiations and interpretations of classical authors, the scholars of the past century have always associated the name of the Encheleans with the meaning of their name, i.e. the "eel-people" as well as with eels themselves and the cult revered in Boeotian lake Kopais.[53] However, such interpretations and associations of the cult with the Encheleans themselves further complicates the situation given that written sources have preserved the information about the reaction of the old Greeks to this cult. The cult of the eel was strongly followed at lake Kopais and among the Thebans, and the words of Eubulus from Athens adequately depict the view of this cult by other Greeks, as Eubulus ridiculed Boeotian beliefs through an overview of their cuisine and young women.[54] This information, in its own way, suggests

the possibility of the spiritual life of Boeotian citizens actually being foreign among the indigenous population. Intriguingly, the same cult appears on the island of Kos, 4 km from present-day Bodrum in ancient Caria, where the tradition of Krisamis of Kosand the eel was part of an established tradition.[55] We encounter a similar situation on the island of Euboea, in the city of Arethusa where eels were allegedly so tame that they approached humans themselves.[56] All this implies the assumption that there indeed were links between trade routes[57] that in reality, by means of myths and religions, connected the places such as Crete, Kos, Boeotia, Euboea, Halkidiki, and Lefkada[58]. In this regard, the interpretation of the name of the Encheleans as a connection with their religious belief, which evidently had not represented comprehensible anthropomorphous deities to the old Greeks, is essentially one of the crucial problems for understanding the overall myth and the far-reaching implications of this myth among the local communities.

The idea of trade relations and colonization can be observed in the elements present in the events from the legend on Cadmus and Harmonia, according to available fragments of the tradition. During his journey to the far north and his new reign, Cadmus bought a cow from Pelagontos,[59] in which Lisičar recognized the possible reasons for moving towards the north in the context of establishing trade relations.[60] During this journey, Cadmo reached Lake Ohrid where he founded the city of Lihnidos, according to an epigram of Christodorus[61]. Finally, apart from Lihnidos, the tradition shows that Cadmus and Harmonia ended their journey in present-day Budva which Cadmus ultimately founded and which became known as Butoa. Memories on Cadmus's arrival and foundation of this city were written already in the 5th century BC by tragedian Sophocles,[62] who

located this city at the mouth of the Drilon River. According to the words of Stephanus of Byzantium, Butoa, as a city in Illyria, named after Cadmus's quick arrival on a bullock cart.[63] Philo of Byblos also mentions the bullock cart adding that Butoa was located by the Rizous River, and Cadmus named the city after the Egyptian city of Buto.[64] After conquering the local population, in alliance with the Encheleans, Cadmus allegedly took the power away from Lycotherses[65], the husband of his daughter Agave, who left Cadmeia after the death of her son Pentheus.[66] Since Cadmus conquered the northern communities in alliance with the Encheleans, at that moment the legend brought Cadmus and Agave together with those northern Hecataeus's Encheleans. If we follow the course of tradition, it is possible to assume that Cadmus left Cadmeia for two reasons. The first is the possibility of establishing trade relations, whereas the second is to offer help to the Encheleans in fighting the local population.[67] Regardless of how Cadmus had established contacts with the northern Encheleans, they were simultaneously located in Boeotia and the north, or they had previously left Cadmeia with Agave and left towards the north or they ultimately did this with Cadmus who set out toward the north. Either way, it seems that, at that moment, through their actions and names, one of the northern communities appeared on the stage of the old Greeks, and all our further knowledge of the northern world was a continuation of close relations. This opens the question of the consequences of the appearance of the Encheleans who were already known to the Greeks in the territory of Boeotia, as well as the problem of how the Greeks identified them or how they identified themselves.

Judging by the available information contained in the works of classical authors, as previously noted, it is possible to assume that the mythical events took place much

sooner than the origin of the first written text which would have recorded them, probably during the Bronze Age. However, how plausible is such an observation outside the framework of legends and testimonies of written sources that are susceptible to subjectivity and different viewpoints of each author? If it were possible to determine the existence of contacts within the suggested area, it would have been possible to open the possibility of interpreting the aforementioned legend in the context of such contacts, as well as for observing the processes of colonization. During this period and somewhat earlier, around 1600 BC, along with the Minoan civilization on the island of Crete, a strong developmental impulse appears on the Greek mainland identified with the appearance of the Mycenaeans, Minoan contemporaries, and successors. Although archaeology still has no answer regarding their origin, modern scholarship believes that they inhabited these regions from 16th to 13th centuries BC, where they quickly established contacts with other peoples such as the Minoans, Hittites, and Egyptians.[68] Rich frescos depicting people doing everyday activities and festivities showing clothes, dishes, jewelry, and even themselves, interpreted as a direct influence of Crete.[69] The findings of wall paintings in the palace of Mycenae, dated to 1550-1450 BC, are associated with the frescos from Knossos.[70] Frescos have also been corroborated at the site of Thebes, where we can see visible links with the island of Thera.[71] A century of research at the site of Thebes has so far produced numerous artifacts whose interpretation has not yet led to a scholarly consensus regarding the origin of the city's population. Almost a century ago, in 1930, A. Keramopoullos formulated a hypothesis regarding Theban rulers as governors of important craft production and overseas trade.[72] As a result of the decipherment of Linear B, numerous plates with inscriptions from the former city of Cadmus – Cadmeia – corroborate the interest of Thebes in the areas of Thespiae, Euboea, and Aegina.[73] Additionally, if we observe the entire region of Boeotia, Thebes is singled out as a unique unparalleled fortification system in the territory of Kopaidi,[74] and the origin of this system can be observed as a separate and external factor within the wider fortification system of Hellas from the Bronze Age. The entire system of fortification of Thebes was focused on the protection of roads connecting the area from the Corinthian Bay to Euripus Strait, the Boeotian isthmus, and the island of Euboea, which suggests the importance of Euboea and the connection of Thebes with the Aegean Sea across Euboea. Sea lanes of commerce are also corroborated by other sites, such as the city of Kition (Cyprus), founded during the 9th century BC, as a continuation of Bronze Age settlement,

which also belonged to a Phoenician *koine* connected with the old Phoenician-Euboean trade route.[75] This is precisely the context for interpreting the tomb of a hero in Lefkandi which is recognized by its inventory as the tomb of a Phoenician aristocrat.[76]

At the site of the so-called Second palace in Thebes, around one hundred cylindrical stamps originating from the east have been found.[77] Several stamps are of the Pre-Babylonian and Babylonian origin, then Mitannian, Hittitian, Cypriot, Kassitian, and Assyrian origin, dated to 2500-1250 BC.[78] According to Buck, the archaeological layer that represents the area of the First Palace of Thebes would belong to the rulers of Amphion and Zethus, and the layer of the Second Palace would belong to Cadmus and the successors from his dynasty.[79] The layer that directly connects Thebes and Eastern Mediterranean[80] in the Late Helladic IIIB period by means of discovered stamps, accordingly belongs to the Cadmeians. One of the discovered stamps is at the same time the only finding that corroborates the use of parchment and plausibly papyrus[81] in the territory of mainland Greece with the Middle East and Egypt.[82] Finally, similar stamps originating from Syria and Mesopotamia have been confirmed on Crete[83] where they arrived through trade routes.[84] In case such findings do not corroborate the actual conquest of the Phoenician colony in the territory of Thebes, their presence strongly affirms trade or similar contacts much earlier than the first written data or it additionally substantiates its claims. Moreover, there are other problematic matters, such as the tomb of "Amphion and Zethus"[85] where T. Spyropoulos saw a step pyramid with 3 tiers, or the issue of a complex irrigation system at lake Kopaidi[86] and others which suggest, but do not corroborate or dispute the arrival of colonists from the east or Egypt.[87] In any case, the fact that there were contacts established among these territories is indisputable and, although the foundation of colonies has not entirely been confirmed, it is evident that the exchange of populations, artisans, and merchants on a smaller scale must be accepted. In this regard, wealthier cities, such as Thebes, were leaders and their interest in trade and production conditioned the need for natural resources, mostly metal. Land dispersion within the process of searching for metallurgical centers was noted by Lisičar

who assumed that the legend of Cadmus and his arrival among the Encheleans hides an interest for the mining wealth from the north and the Adriatic Sea.[88] The inscription of the city of Lihnidos, founded by Cadmus during his travel to the north, led Lisičar to this conclusion.[89] Additionally, the corroboration of the actual city of Lihnidos realized by the discovery of an inscription with a list of citizens, encouraged Lisičar to establish a hypothesis regarding the so-called *Cadmean road* that extended along the same route as an later Roman road *Via Egnatia*.[90] According to Katičić, the tradition and memory of this road, which dates back to the Neolithic, were among the natives of this territory "the most considerable mythological design of old relationships".[91] According to the well-known information, we can assume that the route of *the Cadmean road* went across Trebenište,[92] and that it can easily be associated with Halkidiki, geographically very close to the *Cadmean road itself*. This is precisely the place where famous golden masks were found which are attributed to Enchelean rulers. On the contrary, V. Popović as well as V. Sokolovska believe that the masks from Trebenište must be associated with Crete and Egypt.[93] V. Popović finds the connection of the masks from Trebenište with those from Mycenae only formal.[94]

[88] Lisičar 1951, 115-125.

[89] Lisičar 1953, 257. Originally, it was assumed that Lihnidos was medieval Ohrid where the inscription Λυχνειδιων was found, but subsequent research has confirmed that these monuments were transferred from the surrounding areas.

Ill. 3. Golden mask from Trebenište
(http://www.narodnimuzej.rs/antika/zbirka-grcko-helenistickog-perioda/ [last checked 2021-5-28])

However, the golden masks from the graves of Trebenište are not the only indicator of a wider interaction and long-term contacts of the Adriatic and the Aegean Sea. Apart from the masks, golden bracelets[95] were discovered in graves I and VIII which can be associated with similar findings from the Grave Circle A of Mycenae. Sandals made of gold with depictions of Gorgon[96] were discovered in graves VIII, X, and XII, while metal sandals made of silver were known from Byblos, and thus Trebenište can also be associated with the Middle East, at least indirectly. A. Cermanović associated the golden sandals from Trebenište with vases in the shape of footwear from Greek graves,[97] thus the idea of footwear for the final and long journey of the deceased to the afterlife should originate from the Greek region. Apart from these findings, contacts with the east are corroborated by the silver goblets that can be associated with the similar ones from Teppe Hasanlu and Amlash from Iran.[98] However, the discovery of funeral masks from Sindos, that can be associated with those from Mycenaean graves,[99] and dated as the masks from Trebenište to the period of the 6th century BC, corroborates the frequent use of roads from the Adriatic Sea to Halkidiki[100] whose availability to the Boeotian traders we can assume already in the earliest period through Euboea and Euboean seafarers.

Ill. 5 *and* 6. Beakers from Hasanlu Tepe and Amlash in today's Iran (http://www.iranicaonline.org/articles/hasanlu-teppe-ii#prettyPhoto [sidebar]/0/ and https://clevelandart.org/art/1965.26 [last checked 2021-5-28])

After observing the similarities between the depictions of Gorgon on the crater from Trebenište and a well-known crater from Vix, while having in mind the possibility of a mutual origin, we can confirm the importance of the trade route across Halkidiki to Central Europe. The depictions of Gorgon are well-known in other sites as well, especially from tombs of chiefs, such as a hydria from Novi Pazar displaying the bodiless head of Gorgon.[101]

If we accept the assumption that there are connections between the funeral masks from Sindos and Mycenaean masks, which are chronologically parallel to those from Sindos, the masks from Trebenište can be associated with the Mycenaean ones and the long tradition of manufacture and usage of these funeral masks, as well as with the problem of transmission of ideas and the chronological distance of these sites, more specifically the temporal distance for which transmission had occurred. Such occurrences are not sudden, and older examples are likely to be found in the future. The presence of the Mycenaean culture, or their cultural idea, can be recognized in a tholos tomb in Kiperi on the coast of Epirus, on the Late Mycenaean ceramic from Ilias[102], on the ceramics from the lower layers of the settlement Kastanas[103] and similar finds

which establish connections between the north and the south across Halkidiki. For the old Mycenaeans the sources of amber and tin[104] and opulent mines of Damastion were located in the north. The city of Damastion, that was probably developed along these mines, was located by Ujes and Romić in the region of Kosovo and Metohija[105], testified by multiple finds of drachmas and tetradrachmas.[106] Considering the tradition according to which Cadmus was the inventor of quarries, metallurgy, and bronze production[107] in Thebes, the mines of Damastion were probably one of the reasons why Cadmus left and founded the city of Lihnidos that was close to this metallurgy center. Moreover, Lihnidos is found in an area rich in silver.[108] The cause of Cadmus's arrival to the north was preserved in the tradition according to which Cadmus discovered gold mines and invented mining in the region of the Pangaeum, a mountain in Paeonia[109], where he was later on revered as one of the four Cabeiri[110] of metallurgy[111] under the name of Κάσμιλος-Καδμῖλος.[112] Opulent mines, forests, and developed animal husbandry were probably very alluring to Theban rulers and we can conclude that they wanted to establish control over these precious resources.

Ill. 7. The coins of the city of Damastion (Ujes-Morgan 2018, 7)

For a longer period of time, the presence of the Mycenaean material at the eastern Adriatic coast was well-known at the sites of Pazhok and Vajze in Albania, Tetovo and Iglarevo in Kosovo, in the form of two swords from a tumulus at the Mata River and the place of Varibopi[113], daggers near Niš, Pula, Crvena Stijena, Mostar, Mokrine, Belotići, Živalji, Čitluk, and others. Other well-known finds are labrys axes from Pelagonija, near Bitola, in Northern Macedonia and Niš and Babušnica in Serbia.[114] In this context, it is possible to address a sword from Sisak, Sprockhoff IIb of Erbenheim type according to

[113] Korkuti 1984, 111-113.

[114] Garašanin 1983, 799-806; Parović-Pešikan 1985, 27; Đurić 1984, 17-24; Čović 1983, 114-190.

Cowen, dated to Ha A period, given that there have already been several attempts to associate this type of swords with workshops in Central Europe and Mycenaean Greece.[115] When analyzing swords found in a circle in Mycenae, we need to mention a sword from Vučevica that was initially interpreted as an import from Mycenae. Although there are similarities with the Mycenaean type F2 sword, H. Tomas concluded that differences are considerably more dominant and the inspiration for this sword could be of Aegean origin[116] which, in any case, corroborates the thesis if not of a direct import, then of contacts which were used to transmit the idea. Although the origin of these finds has not been entirely defined, some of which have been bought off in the modern period, in this context we can also mention the ingots from Makarska, Ivanić-Kloštar,[117] and from the island of Pag.[118] Finally, the Mycenaean material has been recorded on the island of Brač[119]. On the other hand, we should note the fact that, at least in the case of Mycenaean material on the eastern Adriatic coast, there is a likely possibility that the majority of these finds came directly from the Apennine Peninsula or from the south where the Mycenaean presence was much better recorded.[120]

When addressing the Bronze Age and the relationship of the eastern Adriatic coast with the Aegean region through the prism of archaeological perception, we come to a question of the Cetina culture and its manifestation in this region. Blagoje Govedarica pointed out the possibility of migration of the population from western Greece to the region of the Cetina culture, i.e. the eastern Adriatic coast, that manifested in cist type graves and accompanying golden material.[121] Similarities in ornaments and shapes of ceramic material indicate a possibility of connections with the cultures of Sicily and Malta[122], whereas the connections with Italy, more specifically Apulia, are much better corroborated with examples such as jugs from an aggregate in Bajagić near Obrovac.[123] By observing the distribution of the Ceina culture as a style and the distribution of a recognizable style instead of a recognizable ethnic-archaeological culture, we can state that the spatial range of this ornamental manifestation was from Trieste to the Peloponnese and from Apulia to Bosnia.[124]

The relationship with Greece is corroborated by finds from Montenegro, primarily tumuli with princely graves in Rubeži near Nikšić, Mala Gruda, Velika Gruda, and Gruda Boljevića. A fragment of a ceramic dish has been found at the site of Rubeži whose ornaments, decorated stripes, and zigzag lines entirely correspond to the finds of dishes in the tumulus of Mala Gruda. This type of dish is usually a standard repertoire of princely graves in Montenegro, although considerable differences between them do exits, such as semicircular carvings on the rim of a dish from Mala Gruda.[125]

Ill. 8. Axes from Mala Gruda and Boljevića Gruda tumuli
(Saveljić-Bulatović, Lutovac 2003, 19; processed by A. Kaljanac)

Moreover, it is important to note that the ornamental motif, at least its basic form made of two stripes crossed in the central section and zigzag lines along the rim, associates and most likely represents a counterpart of a punctured ornament of golden covers of axe holders from the tumuli of Mala Gruda and Gruda Boljevića. Golden covers from these two tumuli correspond to one another in their entirety,[126] and this detail connects the axes from these tumuli with the ceramic material that was most probably associated

[125] Parović-Pešikan, Trbuhović 1974, 129-141.

[126] Baković, Govedarica 2009, 5-22.

with burial rituals. Therefore, this and the fact that the axe from Gruda Boljevića was found outside the grave and not beside the deceased[127] ensure that we observe the axes from the tumuli with princely graves through the prism of practiced cults and rites or as a means of expressing the elements of identity and status.

Ill. 9. Ceramic vessel from tumulus Boljevića Gruda (Provided by P. Lutovac)

The interpretation of the origin of the axe from the tumulus of Mala Gruda has led us to conclude that its origin is the Middle Eastern import[128] that brought on further development of this type of axes.[129] Moreover, axes made of electrum alloy, golden dagger, and hair rings (Noppenring) have on several occasions been associated with Asia Minor, Syria, Byblos, and the Aegean Sea.[130] Kotorac-type axe has frequently been associated with Byblos, hair rings with the Aegean Sea, Troy, and Antioch, and the golden dagger with Koumas.[131] Apart from this, burials of tumuli with princely graves in Montenegro also contained lesser indicators associated with Transcaucasia.[132]

However, although all of this information, the works of classical authors and archaeological indicators, suggest the validity of the statement regarding the contacts of the Mycenaean world with the eastern Adriatic coast, especially its southern part, it seems that such statement is only partially correct. This particularly refers to the problem of chronological determination given that some of the recently published archaeological results suggest much older contacts of the southern part of the eastern Adriatic coast and the Aegean Sea. In this regard, the basic indicator could be the appearance of violin-shaped idols, traditionally associated with the Cycladic culture, as grave goods at several sites. When speaking of the area of the eastern Adriatic coast, violin-shaped idols and their analogies were recorded at the sites of Rakića kuća, Shtoj, Apollonia, Maliq, and Yunazite. During the excavations of tumuli at the site of Shtoj in the 1980s, and published in detail in 2012,[133] discovered the most numerous group of violin-shaped idols, 6 in total. The initial excavations uncovered 14 graves within the tumulus VI, of which the first 13 graves were determined to be originating from the Iron Age, whereas the last grave 14 was identified to be originating from the Bronze Age with recognizable characteristics of the Cetina culture[134]. While the primary results attributed the discovered idols to the oldest grave 14 and the Cetina culture,[135] further research uncovered an initially unknown grave, the grave 15. Given that this grave was buried in the subsoil, directly under the stone cist of the grave 14, it became clear that certain idols should be attributed as goods of this grave, and not the grave 14.[136] Unlike the later period, especially the Iron Age, the initial construction of the tumulus 6 in Shtoj was for a separate individual who represented a unique burial within the construction. This layer was inherited through the subsequent burial of the Cetina culture and an increase of the construction. Violin-shaped idols at the site of Rakića kuća were discovered during the construction of a local road between Podgorica and Tuzi in 1989 when the stone from the tumulus was used as a construction material.[137] In the period of 2002-2006, an excavation of the so-called tumulus 10, containing 77 graves, 49 of which are prehistoric, was conducted at the site of a large prehistoric necropolis in Apollonia.[138] These included the so-called grave 74, which later on turned out to be a ritual site, not a grave.[139] This unit also revealed a broken figurine, whose reconstruction determined that it corresponds to violin-shaped idols,[140] making this site important in the context of contacts of the Aegean region and the western Balkans. Moreover, similar idols and the closest associations were discovered in layer IIIc at the site of Maliq in Albania, and layers of tell

in Yunazite in Bulgaria. Considering the results of the most recent research, along with stylistic characteristics, especially radiocarbon dating conducted at the sites of Rakića kuća, Gruda Boljevića, Apollonia, Velika Gruda, and Odmut, B. Govedarica concluded that the absolute calibrated dates of these sites can be the period of 3050/3000 to 2700 BC.[141]

Ill. 10. Ceramic violin idols discovered in the tumulus Rakića kuća according to the numeration from the research (Provided by B. Govedarica)

Regarding the dates of the appearance of violin idols and their corresponding tumuli, evidently members of a prominent elite, we can conclude that the contacts of the Aegean region and the Adriatic had existed already at the beginning of the 3rd millennium BC, and maintaining these contacts during the period of the 2nd millennium BC would not be surprising, on the contrary, stronger connections would be expected. These connections and contacts could not result only in trade, and the actual establishment of trade colonies and permanent trade routes would not be surprising. Moreover, it would be thoughtless to assume that such long-term traditions until the period of classical Greek colonies at the Adriatic Sea have not left a mark on both cultures and their memories of the past and consequently on their mythological and legendary past.

According to the presented dates, it is quite clear that it would be difficult to argue the connection of tumuli with princely graves and their materials with legendary Cadmus and his Phoenicians, but the very existence of contacts between the Adriatic region in the first phases of the 3rd millennium BC with the south opens up the possibility of considering trade colonies at the beginning and during the Bronze Age. The search for metals and the establishment of steady communications with regions deeper into the continent in the memory of the old Greeks may have reflected through the Phoenicians

[141] Govedarica 2016, 24.

as a symbol of the eastern Mediterranean Basin. The words of Herodotus share the information about how the Phoenicians had founded a colony on the island of Thasos, adjacent to the island of Samothrace[142], just beside the aforementioned Halkidiki. According to the tumuli with princely graves from Montenegro, trade relations or mutual influences and exchange speak of contacts dating back to the early phases of the 3rd millennium BC. They also indicate the roots of the legend of Cadmus and Harmonia later, perhaps already around the 15th century BC.

According to different genealogies, such as the one presented by Herodotus,[143] or Hecataeus and Hellanicus, as well as researchers such as S. Symeonoglou[144], the events described in the legend of the appearance of the Phoenicians in the territory of Greece, their leader Cadmus and his wife Harmonia, their transformation into serpents, who were revered long after, can be dated to the very early period of about 16th to 15th century BC. In this sense, an archaeological find of the Parian Marble or Chronicle[145] suggests the arrival of Cadmus and the foundation of Thebes and dates them to 1509/8 BC:[146]*"From when Cadmus the son of Agenor came to Thebes [_____and] built the Cadmeia, 1255 years, when Amphictyon was king of Athens"*.[147] If we use this find as a chronological orientation, the tradition regarding these events could not have been much younger. Most certainly, the date, in this case, is no longer as crucial as the statement that the territories of present-day Herzegovina, Montenegro, Albania, and Northern Macedonia participated in a long-lasting tradition of established contacts with the Aegean region, and the fact, established in such context, that the entire myth of a legendary hero, Sidonian Cadmus, could indeed have a historical background, regardless of its form, and that "some" events actually happened.

Ill. 11. Parian Marble with a chronological table (http://digitalmarmorparium.org/images/marmor_parium_fragment_a_1_ashmolean.jpg [last checked 2021-5-28])

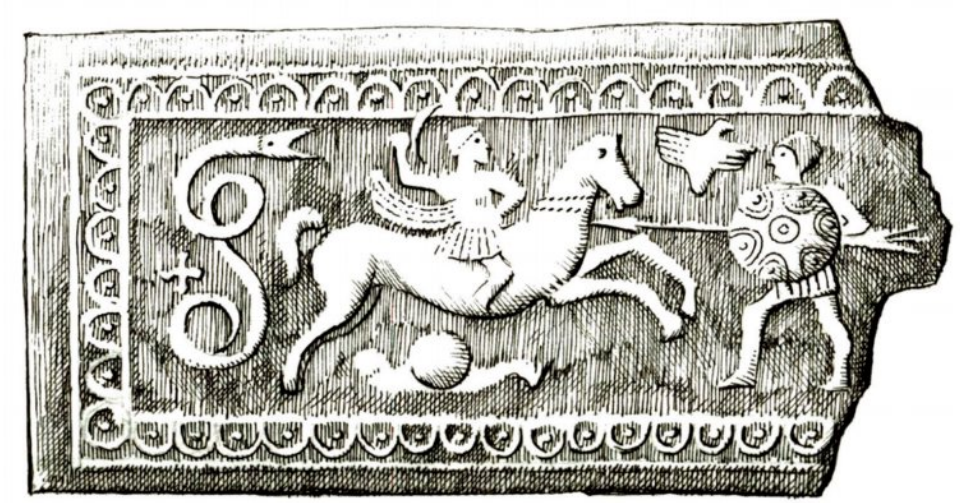
While myths and legends, although essentially inseparable, required foundations of their origin and a period of fossilization from live memory into a myth or a legend, it is entirely reasonable to assume that *every generation of the old Greeks modified inherited myths anew instead of creating new traditions.*[148] The foundations of legends most likely remained the same and *it is unimaginable that Greek mythology was created as an entirely new set of traditions in order to replace the events that had taken place earlier.*[149] Referring to the aforementioned fundamental premise of Kristiansen that fossilization is a long process of up to 1000 years, possibly even longer, then it is no surprise that there are numerous finds directly and indirectly connected to serpents and a manifestation of memory recently associated by scholars with the cult of ancestors.

Apart from the very meaning of the name of the community of the Encheleans, the connection of immigrated colonists, conditionally named so, and the religious belief in eels or serpents can be established with the meaning of names of legendary personalities of Cadmus and Harmonia who embody an entire cult according to an ancient belief. The first link is the Hebrew east, *Qedem*, the place of origin of Cadmus, whereas the name of his wife Harmonia is connected with the mount Hermon populated by the Hivites, meaning

[148] Finkelberg 2006.

[149] Dowden 1992.

serpent[150] in Phoenician. The connections of the Hivites and Harmonia with the serpent certainly could reach goddess Ishtar who was frequently depicted together with a serpent next to her body. The serpent, as a symbol of life and death, has evidently been present ever since the Neolithic,[151] while its dominant position in religion reached its peak in the period starting from the three-age system and further. The importance of the belief system of former inhabitants of these regions was recorded by Homer who wrote an impressive description of a Paeonian, Asteropaios, whose body was eaten by eels and thus symbolically removed from the battlefield.[152] The territory familiar to Asteropaios as a Paeonian, near Hecataeus's Encheleans, uncovered two plates with a depiction of soldiers leaving for battle while being watched by an upright serpent, one in Albania on the coast of Lake Ohrid,[153] and the other at the site near Gostilj in Montenegro by Shkodra Lake.[154]



Ill. 12. A plate from the site of Gostilj in Montenegro (Benac 2012, 22)

The importance of the depicted serpent as a cult of ancestors or Cadmus himself who accompanies soldiers to battle keeping a watchful eye is not essential in this context, because we could claim that Cadmus indeed is a heroized ancestor, as different interpretation would be essentially the same. From a geographic point of view, the place where these plates were uncovered, in the land inhabited by the Encheleans, the community which was obviously hidden in an obscure past even for the Greeks themselves, is where

[150] Calmet 1832.

[154] Basler 1969, 5-107.

Cadmus found refuge and where he died. According to Apollonius of Rhodes, the graves of Cadmus and Harmonia are located here by the black Illyrian river in the land of the Encheleans.[155] Although maybe not for modern researchers, verbal and described geographical features could be found in this region, so in Periplus Pseudo-Skilax writes that by the coast of the Rizous river, there are graves made in some way out of stone, belonging to Cadmus and Harmonia who, even after their death, were the ancestors whom former sailors sailed to. *From the Arion* river to the *Rizous* river is half a day›s sail. The stones of *Cadmus* and *Harmonia* are here, and a sanctuary not far from the *Rizous* river.[156] For these sailors, even after the metamorphosis into serpents, Cadmus and Harmonia were amply real and true.

In connection with the fact that protagonists of this legend were real to the old Greeks, in conclusion we can make a presumption about the origin of the Encheleans from Greek Boeotia or even from the Middle East, from where they carried the cult of serpent-eel that was spread among the inhabitants of the eastern Adriatic coast and its hinterland, who were thus named the Illyrians, serpent-people, followers of the cult of the serpent. The Encheleans could be considered the leaders of the cult of serpent-eel, an ethnonym of the Illyrians which later gradually spread toward the north and deeper into the hinterland of the Adriatic Sea to be finally encompassed by the Roman administrative unit, the province of Illyricum, entirely different from the Old Greek Illyria which to old logographers represented the only geographic-religious region inhabited by the followers of the cult of the serpent, the people associated with this cult and their name Ἰλλυριοὶ.

[155] Ap. Rhod. Argon. 4, 516-519: οἱ δ' ἄρ' ἐπ' Ἰλλυρικοῖο μελαμβαθέος ποταμοῖο, τύμβος ἵν' Ἁρμονίης Κάδμοιό τε, πύργον ἔδειμαν, ἀνδράσιν Ἐγχελέεσσιν ἐφέστιοι· οἱ δ' ἐν ὄρεσσιν ἐνναίουσιν ἅπερ τε Κεραύνια κικλήσκονται.

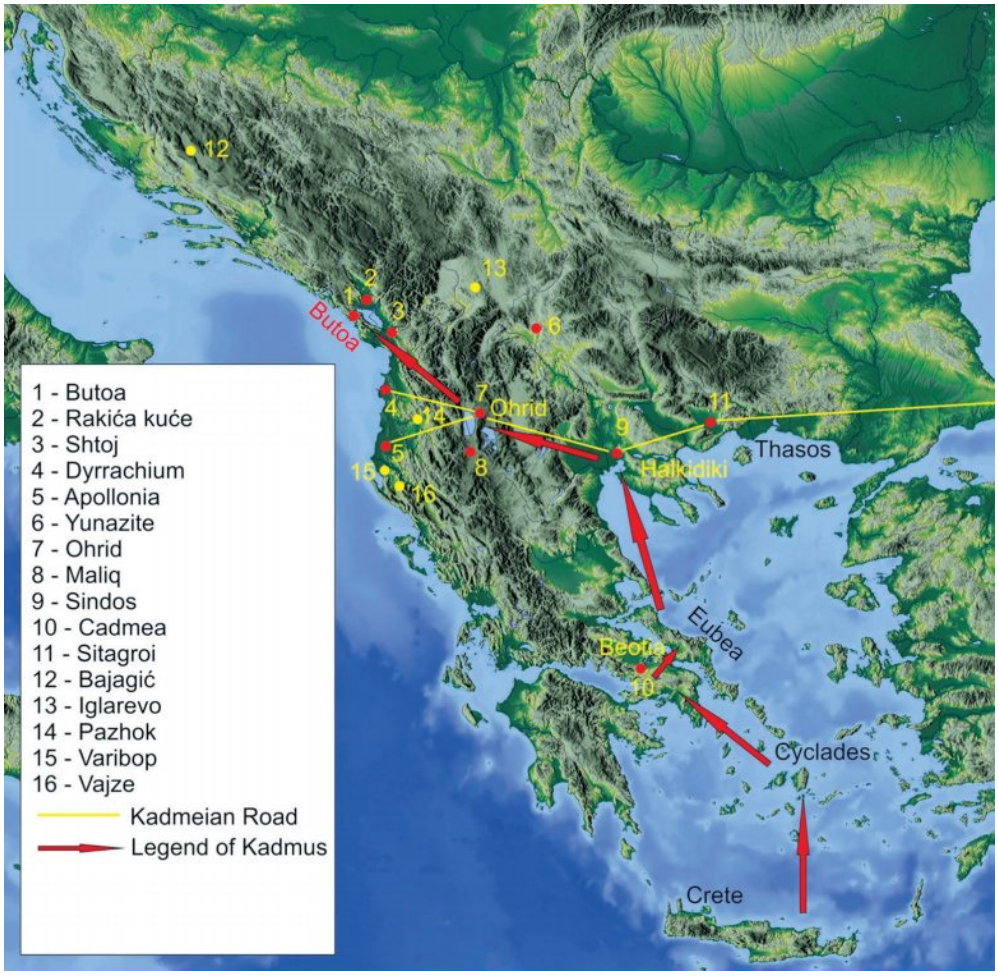

Map 1: The arrival of Cadmus in Greece and his crossing to the north with known sites (Map made by: A. Kaljanac on a template downloaded from www.maps-for-free.com on 2021-5-28)

Conclusion

The legend of Cadmus and his wife Harmonia is one of the oldest legends about the peoples who inhabited the region of the eastern Adriatic coast. Considering a common belief that legends are in fact historical events with historical background and actual locations, the preserved works that conveyed the information of the Sidonian hero clearly categorized Cadmus as one of the legends and legendary personalities who, during their lifetime, passed through and acted in historically established locations such as the old Cadmeia, Delphi, Lihnidos, and Butoa, present-day Budva, where he ultimately ended his legendary journey. After observing two works of the former unity, a live culture that truly experienced the legend of Cadmus, the written words and their relationships with

the material data about the potential contacts of the region of the southern part of the eastern Adriatic coast and the Aegean Sea, we can conclude that the earliest contacts of this region dated much further into the past than datable information produced by classical authors. At the same time, the fact that these memories were written down, clearly shows, as we can see in the later period, that the traditions of important events were strong and long-established. Although mysterious, logographer, poets, the first historians, classical authors wrote about communities such as the Encheleans who at a certain point of time inhabited the territory of Greece, but at another, they were at the far north, waging wars and creating what will later become known as their kingdom. There is plenty of information regarding these people, so that earlier researchers could associate them with part of their beliefs, especially eels, and correlate them with other, similar, and perhaps identical cult – the cult of the serpent.

Numerous finds of archaeological provenance, from those stylistically connected to those having elements of direct influences such as violin idols, corroborate mutual contacts of these regions. This creates the opportunity to observe the legend of Cadmus as the result of these relations, as pointed out by Marianna Koromila, being manifested through hundreds of Greek sailors. As part of these movements, there is an episode of Cadmus's crossing to the north when the Encheleans from the north first appeared – those who had a special place in the history of the ancient Greeks. Despite the lack of data about them, this fact suggests the importance of their role – the role that remained permanently hidden and completely unknown. On the other hand, their belief and cult, as well as their name, may have been the historical reason why they have never been forgotten. If we observe the testimonies of them as eel-people at the territory of Boeotia, their appearance as such in the north, the legendary foundation of Butoa, and the fact that they are the oldest well-known community in this region to their southern neighbors, we can assume that they were also an eponymous community of the entire region in the later history. If their appearance at the north was part of trade relations or even colonization process from the south, their name and site, and new Cadmeias and Butoas became the focal point of contacts, information sources, and familiarization with the north for their contemporaries in Greece. As such, they secured their historical role in Greek ecumenism. Workshops produced items for trade towards the Encheleans as the first destination, their ports were a clear orientation and refuge, from where the trade could continue toward the north and from the north to the south. More importantly, their belief in eels and the similarity with the belief in serpents, although it is difficult to assume a clear differentiation between the two, given that they were named after their cult in Boeotia, could have played an important role in the appearance of the name of Illyrians, as well as their perception by the ancient Greeks. The similarity in meaning of the names of the Encheleans and the Illyrians implies a certain connection that could be the result of a coincidence or identical beliefs or the acceptance of beliefs of the

Encheleans themselves among local communities who were not unfamiliar with serpents and their cult and which did not aspire to the anthropomorphism of deities as the Greeks did. In this regard, the term Illyrian could determine the Encheleans themselves, and later on others who had the same beliefs in some of or in a local language. The belief in the cult of the serpent, which was associated by Cadmus himself with the cult of ancestors first by killing one serpent in Greece, then turning himself into one, could be a manifestation associated with ancestors whose origin was inevitably always in the legends, deities which were often associated with the same ancestors, and ultimately with the manifestation of spiritual beings in mundane, revered serpents, dragons, eels. If we consider that compared to numerous communities that the Greeks and even the Romans were familiar with in the later period, the most important community, named by the modern scholarship as the Illyrians, was entirely unknown without any specific mention of its geographic position but only a wider geographic setting, we can assume that for those who created the written works, the Illyrians had never existed. For them, it might have been perfectly clear and factual that this term of the language of the north implies first of all the Encheleans, then all those associated with their belief in the later period. Although perhaps an ordinary transcription, perhaps Pliny's or Mela's fact *that they were named or called as such*, or perhaps a strong dichotomy with beliefs of the ancient Greeks, it seems that this is a community which, by departing from the Greek framework, brought with itself the name and beliefs that resulted in creating different ones. Therefore, in accordance with the existence of contacts in the territory of present-day Montenegro and its proximity, it is possible to conclude that the legend of Cadmus, his foundation of the city of Butoa, as well as mutual relations corroborated by archaeology, were part of a process that had far-reaching consequences from the direct influence of Greece on this region and influence of this region on former Greece. At the same time, mutual acquaintance resulted in the fact that the Greeks were faced with an elusive and mysterious community which they had never defined, possibly because they were familiar with it within the framework of their language, whose name had spread from this region to a significantly wider region to be ultimately adopted by the Roman Empire due to a completely different administrative perception, followed by the scholarship of the 20th century.

Sažetak: Legenda o Kadmu – Osnivanje grada Butoa i moguće porijeklo imena Iliri

Legenda o sidonskom heroju Kadmu (*Cadmus*) i njegovoj supruzi Harmoniji (*Harmonia*) jedna je od najstarijih legendi povezanih sa stanovnicima prahistorijskog Balkana. Rani izvori povezuju stanovnike istočne jadranske obale sa zmijama ili jeguljama. Moderna znanost je utvrdila činjenicu da je u prethistorijskom periodu značajnu ulogu u identificiranju i samoidentificiranju zajednica imao kult predaka. Legendu o Kadmu i njegov dolazak na prostor današnje Crne Gore, osnivanje grada *Butoe* (Budve) i smrt pretvaranjem u zmije, moguće je prepoznati kao tragove vjerovanja u kult predaka. Prateći tradiciju ovog mita moguće je konstatirati da je cjelokupan proces reprezentirao stvaranje snažnih trgovačkih veza, potencijalno osnivanje trgovačkih kolonija, prilikom čega se kao posljedica u znanju grčkih autora pojavila eventualna transkripcija imena Enhelejaca u Ilire, bazirana na jeziku lokalnih zajednica sjevera. Na ovaj način, imena Ilira i Enhelejaca u grčkoj Beotiji nisu reprezentirali nijednu etničku zajednicu, niti danas prepoznatljivu arheološku kulturu, već vjerovanja i kult većeg broja zajednica koje su u ovim mitskim bićima pronalazili i svoje pretke poput legendarnog junaka iz Sidona.

REPORT

Continuity and Admixture in the Last Five Millennia of Levantine History from Ancient Canaanite and Present-Day Lebanese Genome Sequences

Marc Haber,[1,9,*] Claude Doumet-Serhal,[2,9] Christiana Scheib,[3,9] Yali Xue,[1] Petr Danecek,[1] Massimo Mezzavilla,[1] Sonia Youhanna,[4] Rui Martiniano,[1] Javier Prado-Martinez,[1] Michał Szpak,[1] Elizabeth Matisoo-Smith,[5] Holger Schutkowski,[6] Richard Mikulski,[6] Pierre Zalloua,[7,8] Toomas Kivisild,[3] and Chris Tyler-Smith[1,*]

The Canaanites inhabited the Levant region during the Bronze Age and established a culture that became influential in the Near East and beyond. However, the Canaanites, unlike most other ancient Near Easterners of this period, left few surviving textual records and thus their origin and relationship to ancient and present-day populations remain unclear. In this study, we sequenced five whole genomes from ~3,700-year-old individuals from the city of Sidon, a major Canaanite city-state on the Eastern Mediterranean coast. We also sequenced the genomes of 99 individuals from present-day Lebanon to catalog modern Levantine genetic diversity. We find that a Bronze Age Canaanite-related ancestry was widespread in the region, shared among urban populations inhabiting the coast (Sidon) and inland populations (Jordan) who likely lived in farming societies or were pastoral nomads. This Canaanite-related ancestry derived from mixture between local Neolithic populations and eastern migrants genetically related to Chalcolithic Iranians. We estimate, using linkage-disequilibrium decay patterns, that admixture occurred 6,600–3,550 years ago, coinciding with recorded massive population movements in Mesopotamia during the mid-Holocene. We show that present-day Lebanese derive most of their ancestry from a Canaanite-related population, which therefore implies substantial genetic continuity in the Levant since at least the Bronze Age. In addition, we find Eurasian ancestry in the Lebanese not present in Bronze Age or earlier Levantines. We estimate that this Eurasian ancestry arrived in the Levant around 3,750–2,170 years ago during a period of successive conquests by distant populations.

The Near East, including the Levant, has been central to human prehistory and history from the expansion out of Africa 50–60 thousand years ago (kya),[1] through post-glacial expansions[2] and the Neolithic transition 10 kya, to the historical period when Ancient Egyptians, Greeks, Phoenicians, Assyrians, Babylonians, Persians, Romans, and many others left their impact on the region.[3] Aspects of the genetic history of the Levant have been inferred from present-day DNA,[4,5] but the more comprehensive analyses performed in Europe[6–11] have shown the limitations of relying on present-day information alone and highlighted the power of ancient DNA (aDNA) for addressing questions about population histories.[12] Unfortunately, although the few aDNA results from the Levant available so far are sufficient to reveal how much its history differs from that of Europe,[13] more work is needed to establish a thorough understanding of Levantine genetic history. Such work is hindered by the hot and sometimes wet environment,[12,13] but improved aDNA technologies including use of the petrous bone as a source of DNA[14] and the rich archaeological remains available encouraged us to further explore the potential of aDNA in this region. Here, we present genome sequences from five Bronze Age Lebanese samples and show how they improve our understanding of the Levant's history over the last five millennia.

During the Bronze Age in the Levant, around 3–4 kya, a distinctive culture emerged as a Semitic-speaking people known as the Canaanites. The Canaanites inhabited an area bounded by Anatolia to the north, Mesopotamia to the east, and Egypt to the south, with access to Cyprus and the Aegean through the Mediterranean. Thus the Canaanites were at the center of emerging Bronze Age civilizations and became politically and culturally influential.[15] They were later known to the ancient Greeks as the Phoenicians who, 2.3–3.5 kya, colonized territories throughout the Mediterranean reaching as far as the Iberian Peninsula.[16] However, for uncertain reasons but perhaps related to the use of papyrus instead of clay for documentation, few textual records have survived from the Canaanites themselves and most of their history known today has been reconstructed from ancient Egyptian and Greek records, the Hebrew Bible, and archaeological excavations.[15] Many uncertainties still surround the origin of the Canaanites. Ancient Greek historians believed their homeland was located in the region of the Persian Gulf,[16,17] but modern researchers tend to reject this hypothesis because of archaeological and historical evidence

of population continuity through successive millennia in the Levant. The Canaanite culture is alternatively thought to have developed from local Chalcolithic people who were themselves derived from people who settled in farming villages 9–10 kya during the Neolithic period.[15] Uncertainties also surround the fate of the Canaanites: the Bible reports the destruction of the Canaanite cities and the annihilation of its people; if true, the Canaanites could not have directly contributed genetically to present-day populations. However, no archaeological evidence has so far been found to support widespread destruction of Canaanite cities between the Bronze and Iron Ages: cities on the Levant coast such as Sidon and Tyre show continuity of occupation until the present day.

aDNA research has the potential to resolve many questions related to the history of the Canaanites, including their place of origin and fate. Here, we sampled the petrous portion of temporal bones belonging to five ancient individuals dated to between 3,750 and 3,650 years ago (ya) from Sidon, which was a major Canaanite city-state during this period (Figures S1 and S2). We extracted DNA and built double-stranded libraries according to published protocols without uracil-DNA glycosylase treatment.[18–21] We sequenced the libraries on an Illumina HiSeq 2500 using 2× 75 bp reads and processed the sequences using the PALEOMIX pipeline.[22] We retained reads ≥30 bp and collapsed pairs with minimum overlap of 15 bp, allowing a mismatch rate of 0.06 between the pairs. We mapped the merged sequences to the *hs37d5* reference sequence, removed duplicates, removed two bases from the ends of each read, and randomly sampled a single sequence with a minimum quality of ≥20 to represent each SNP. We obtained a genomic coverage of 0.4–2.3× and a mitochondrial DNA (mtDNA) genome coverage of 53–164× (Table 1). Y chromosome genotypes were jointly called across males from the 1000 Genomes Project, present-day Lebanese, and two identified Canaanite males using FreeBayes v.0.9.18.[23] A maximum likelihood phylogeny was inferred using RAxML v.8.2.10[24] and visualized using iTOL v.3.5.3.[25] In order to assess ancient DNA authenticity, we estimated mtDNA and X chromosome contamination[26–28] (Table S1) and restricted some analyses to sequences with aDNA damage patterns[29,30] (Figures S3 and S4), demonstrating that the sequence data we present are endogenous and minimally contaminated.

Additionally, we sequenced whole genomes of 99 present-day Lebanese individuals with informed consent to ~8× coverage on an Illumina HiSeq 2500 using 2× 100 bp reads in a study approved by The Wellcome Trust Sanger Institute's Human Materials and Data Management Committee (13/010 and 14/072). We merged the low-coverage Lebanese data with four high-coverage (30×) Lebanese samples,[31] 1000 Genomes Project phase 3 CEU, YRI, and CHB populations,[32] and sequence data previously published from regional populations (Egyptians, Ethiopians, and Greeks).[1,31] Raw calls were generated using bcftools (bcftools mpileup -C50 -pm3 -F0.2 -d10000 | bcftools call -mv, version 1.2-239-g8749475) and filtered to include only SNPs with the minimum of two alternate alleles in at least one population and site quality larger than ten; we excluded sites with a minimum per-population HWE and total HWE less than 0.01[33] and sites within 3 bp of an indel. The filtered calls were then pre-phased using shapeit (v.2.r790)[34] and their genotypes refined using beagle (v.4.1).[35] We have previously described the genetic structure in the Lebanese population using array data from ~1,300 individuals.[4] A principal component analysis (PCA) using the 99 sequenced present-day individuals show that they capture the previously described genetic diversity with distinct clusters reflecting the different cultural groups in Lebanon today (Figure S5).

We combined our ancient and modern samples with previously published ancient data[6–11,13,36–38] (Figure 1A) resulting in a dataset of 389 individuals and 1,046,317 SNPs when ancient and Lebanese samples were analyzed, and 546,891 SNPs when 2,583 modern samples from the Human Origins genotype data were included in the analysis (i.e., the small dataset was used only when a modern population other than the Lebanese was included in the test).[9,39] A pooled Lebanese sequence dataset (99 low coverage plus 4 high coverage) was used in all analyses except for the PCA and ADMIXTURE where a subset of 15 randomly selected individuals (5 from each group described in Figure S5) was used to avoid sample size

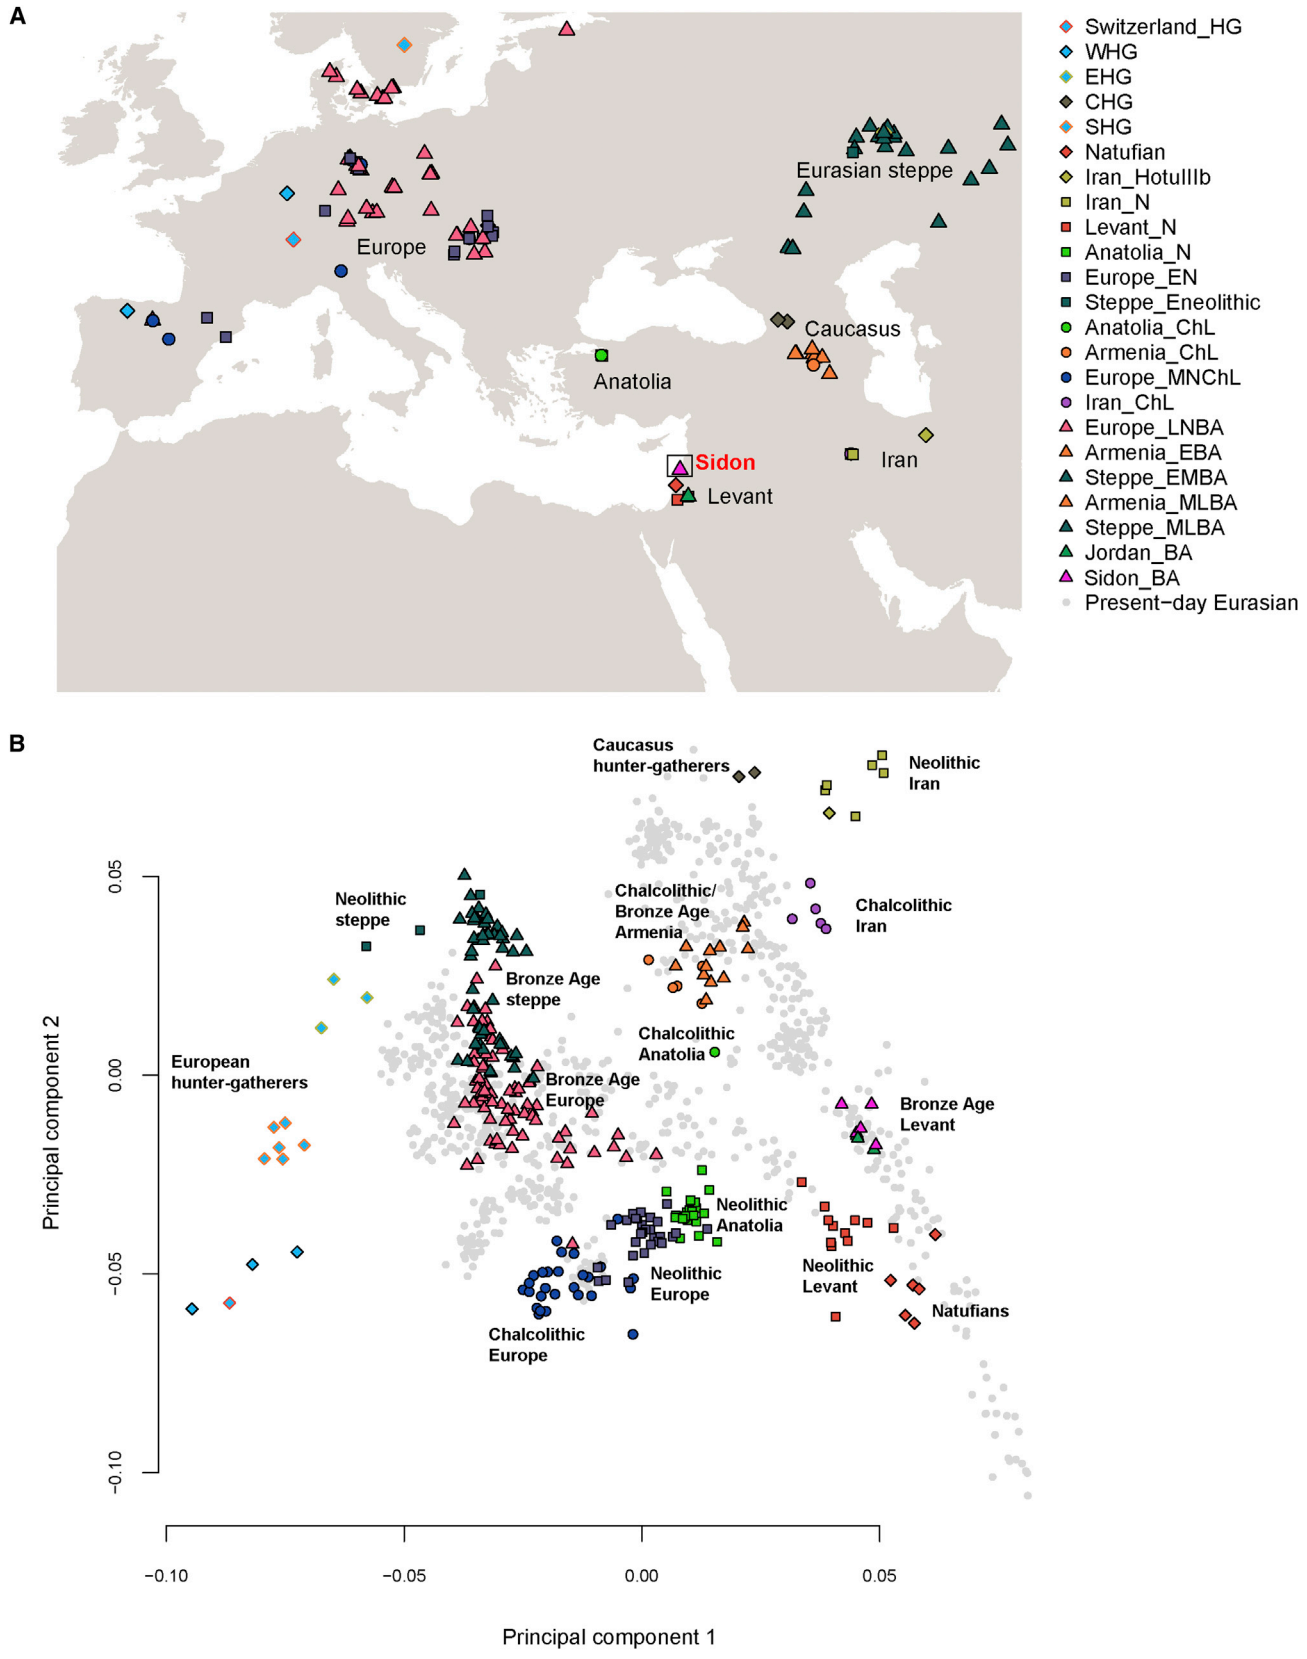

Figure 1. Population Locations and Genetic Structure
(A) The map shows the location of the newly sequenced Bronze Age Sidon samples (pink triangle labeled with red text), as well as the locations of published ancient samples used as comparative data in this study.
(B) PCA of ancient Eurasian samples (colored shapes) projected using eigenvectors from present-day Eurasian populations (gray points).

bias. The ancient samples were grouped following the labels assigned by Lazaridis et al.[13] on the basis of archaeological culture, chronology, and genetic clustering. We used this dataset to shed light on the genetic history of the Canaanites, resolving their relationship to other ancient populations and assessing their genetic contribution to present-day populations.

We first explored our dataset using PCA[40] on present-day West Eurasian (including Levantine) populations and projected the ancient samples onto this plot (Figures 1B and S6). The Bronze Age Sidon samples (Sidon_BA) overlap with present-day Levantines and were positioned between the ancient Levantines (Natufians/Neolithic) and ancient Iranians (Neolithic/Chalcolithic). The overlap between the Bronze Age and present-day Levantines suggests a degree of genetic continuity in the region. We explored this further by computing the statistic *f4*(Lebanese, present-day Near Easterner; Sidon_BA, Chimpanzee) using *qpDstat*[39] (with parameter f4mode: YES) and found that Sidon_BA shared more alleles with the Lebanese than with most other present-day Levantines (Figure S7), supporting local population continuity as observed in Sidon's archaeological records. When we substituted present-day Near Easterners with a panel of 150 present-day populations available in the Human Origins dataset, we found that only Sardinians and Italian_North shared significantly more alleles with Sidon_BA compared with the Lebanese (Figure S8). Sardinians are known to have retained a large proportion of ancestry from Early European farmers (EEFs) and therefore the increased affinity to Sidon_BA could be related to a shared Neolithic ancestry. We computed *f4*(Lebanese, Sardinian/Italian_North; Sidon_BA, Levant_N) and found no evidence of increased affinity of Sardinians or Italian_North to Sidon_BA after the Neolithic (both Z-scores are positive). We next wanted to explore whether the increased affinity of Sidon_BA to the Lebanese could also be observed when analyzing functionally important regions of the genome that are less susceptible to genetic drift. Our sequence data allowed us to scan loci linked to phenotypic traits and loci previously identified as functional variants in the Lebanese and other Levantines.[41–43] Using a list of 84 such variants (Table S2), we estimated the allele frequency (AF) in Sidon_BA using ANGSD[26] based on a method from Li et al.[44] and calculated Pearson pairwise correlation coefficients between AF in Sidon_BA and AF in Africans, Europeans, Asians,[32] and Lebanese. We found a high significant correlation between Sidon_BA and the Lebanese ($r = 0.74$; 95% CI = 0.63–0.82; p value = 8.168×10^{-16}) and lower correlations between Sidon_BA and Europeans ($r = 0.56$), Africans ($r = 0.55$), and Asians ($r = 0.53$) (Figure S9). These results support population continuity in the region and suggest that several present-day genetic disorders might stem from risk alleles that were already present in the Bronze Age population. In addition, SNPs associated with phenotypic traits show that Sidon_BA and the Lebanese had comparable skin, hair, and eye colors (in general: light intermediate skin pigmentation, brown eyes, and dark hair) with similar frequencies of the underlying causal variants in *SLC24A5* and *HERC2*, but with Sidon_BA probably having darker skin than Lebanese today from variants in *SLC45A2* resulting in darker pigmentation (Table S2).

The PCA shows that Sidon_BA clusters with three individuals from Early Bronze Age Jordan (Jordan_BA) found in a cave above the Neolithic site of 'Ain Ghazal and probably associated with an Early Bronze Age village close to the site.[13] This suggests that people from the highly differentiated urban culture on the Levant coast and inland people with different modes of subsistence were nevertheless genetically similar, supporting previous reports that the different cultural groups who inhabited the Levant during the Bronze Age, such as the Ammonites, Moabites, Israelites, and Phoenicians, each achieved their own cultural identities but all shared a common genetic and ethnic root with Canaanites.[15] Lazaridis et al.[13] reported that Jordan_BA can be modeled as mixture of Neolithic Levant (Levant_N) and Chalcolithic Iran (Iran_ChL). We computed the statistic *f4*(Levant_N, Sidon_BA; Ancient Eurasian, Chimpanzee) and found that populations from the Caucasus and ancient Iran shared more alleles with Sidon_BA than with Neolithic Levant (Figure 2A and S10). We then used *qpAdm*[8] (with parameter allsnps: YES) to test whether Sidon_BA can be modeled as mixture of Levant_N and any other ancient population in the dataset and found good support for the model of Sidon_BA being a mixture of Levant_N (48.4% ± 4.2%) and Iran_ChL (51.6% ± 4.2%) (Figure 2B; Table S3).

In addition, the two Sidon_BA males carried the Y-chromosome haplogroups[45] J-P58 (J1a2b) and J-M12 (J2b) (Tables 1 and S4; Figure S11), both common male lineages in the Near East today. Haplogroup J-P58 is frequent in the Arabian peninsula with proposed origins in the Zagros/Taurus mountain region.[46] It forms the vast majority of the Y chromosomes in southwestern Mesopotamia and reaches particularly high frequencies (74.1%) in Marsh Arabs in Iraq.[47] On the other hand, haplogroup J-M12 is widespread at low frequency from the Balkans to India and the Himalayas, with Albanians having the highest proportions (14.3%).[48] We compiled frequencies of Y-chromosome haplogroups in this geographical area and their changes over time in a dataset of ancient and modern Levantine populations (Figure S12), and note, similarly to Lazaridis et al.,[13] that haplogroup J was absent in all Natufian and Neolithic Levant male individuals examined thus far, but emerged during the Bronze Age in Lebanon and Jordan along with ancestry related to Iran_ChL. All five Sidon_BA individuals had different mitochondrial DNA haplotypes[49] (Table 1), belonging to paragroups common in present-day Lebanon and nearby regions (Table S5) but with additional derived variants not observed in our present-day Lebanese dataset.

We next sought to estimate the time when the Iran_ChL-related ancestry penetrated the Levant. Our

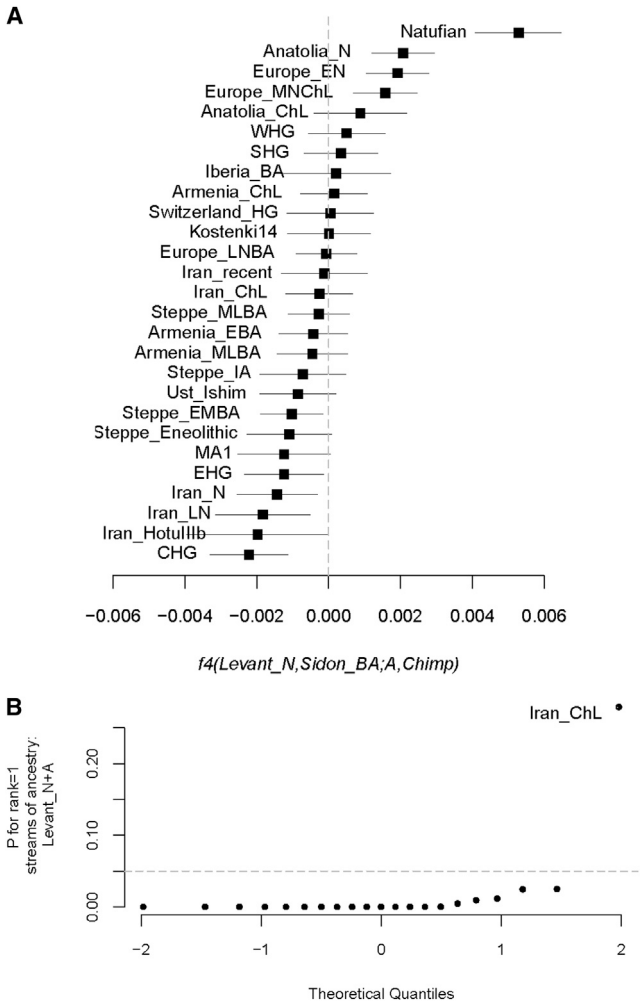

Figure 2. Admixture in Bronze Age Levantine Populations
(A) The statistic *f4*(Levant_N, Sidon_BA; Ancient Eurasian, Chimpanzee) is most negative for ancient populations from the Caucasus and Iran, suggesting an increase in ancestry related to these populations in Sidon after the Neolithic period. The plot shows the estimated statistic value and ±3 standard errors.
(B) Modeling Sidon as mixture between Neolithic Levant and an ancient Eurasian population shows that Chalcolithic Iran fits the model best when using a large number of outgroups: Ust_Ishim, Kostenki14, MA1, Han, Papuan, Ami, Chukchi, Karitiana, Mbuti, Switzerland_HG, EHG, WHG, and CHG. Sidon_BA can then be modeled using *qpAdm* as 0.484 ± 0.042 Levant_N and 0.516 ± 0.042 Iran_ChL.

results support genetic continuity since the Bronze Age and thus our large dataset of present-day Lebanese provided an opportunity to explore the admixture time using admixture-induced linkage disequilibrium (LD) decay. Using ALDER[50] (with mindis: 0.005), we set the Lebanese as the admixed test population and Natufians, Levant_N, Sidon_BA, Iran_N, and Iran_ChL as reference populations. To account for the small number of individuals in the reference populations and the limited number of SNPs in the dataset, we took a lenient minimum Z-score = 2 to be suggestive of admixture. The most significant result was for mixture of Levant_N and Iran_ChL (p = 0.013) around 181 ± 54 generations ago, or ~5,000 ± 1,500 ya assuming a generation time of 28 years (Figure S13A). This admixture time, based entirely on genetic data, fits the known ages of the samples based on archaeological data since it falls between the dates of Sidon_BA (3,650–3,750 ya) and Iran_ChL (6,500–5,500 ya). The admixture time also overlaps with the rise and fall of the Akkadian Empire which controlled the region from Iran to the Levant between ~4.4 and 4.2 kya. The Akkadian collapse is argued to have been the result of a widespread aridification event around 4,200 ya.[51,52] Archaeological evidence in this period documents large-scale influxes of refugees from Northern Mesopotamia toward the south, where cities and villages became overpopulated.[53] Our confidence intervals for the admixture dates are wide and therefore the historical links suggested here should be considered with caution. Future sampling of ancient DNA from northern Syria and Iraq will reveal whether these populations carried the Iran_ChL-related ancestry and also provide a better understanding of the origin of the eastern migrants and the time when they arrived in the Levant.

Although *f4* tests showed that present-day Lebanese share significantly more alleles with Sidon_BA than other Near Eastern populations do, indicating genetic continuity, we failed to model the present-day Lebanese using streams of ancestry coming only from Levant_N and Iran_ChL (*qpAdm* rank1 $p = 8.36 \times 10^{-7}$), in contrast to our success with Sidon_BA. We therefore further explored our dataset by running ADMIXTURE[54] in a supervised mode using Western hunter-gatherers (WHG), Eastern hunter-gatherers (EHG), Levant_N, and Iran_N as reference populations. These four populations have been previously[13] found to contribute genetically to most West Eurasians. The ADMIXTURE results replicate the findings from *qpAdm* for Sidon_BA and show mixture of Levant_N and ancient Iranian populations (Figure 3A). However, the present-day Lebanese, in addition to their Levant_N and ancient Iranian ancestry, have a component (11%–22%) related to EHG and Steppe populations not found in Bronze Age populations (Figure 3A). We confirm the presence of this ancestry in the Lebanese by testing *f4*(Sidon_BA, Lebanese; Ancient Eurasian, Chimpanzee) and find that Eurasian hunter-gatherers and Steppe populations share more alleles with the Lebanese than with Sidon_BA (Figures 3B and S14). We next tested a model of the present-day Lebanese as a mixture of Sidon_BA and any other ancient Eurasian population using *qpAdm*. We found that the Lebanese can be best modeled as Sidon_BA 93% ± 1.6% and a Steppe Bronze Age population 7% ± 1.6% (Figure 3C; Table S6). To estimate the time when the Steppe ancestry penetrated the Levant, we used, as above, LD-based inference and set the Lebanese as admixed test population with Natufians, Levant_N, Sidon_BA, Steppe_EMBA, and Steppe_MLBA as reference populations. We found support (p = 0.00017) for a mixture between Sidon_BA and Steppe_EMBA which has occurred around 2,950 ± 790 ya (Figure S13B). It is important to note here that Bronze Age Steppe populations used in

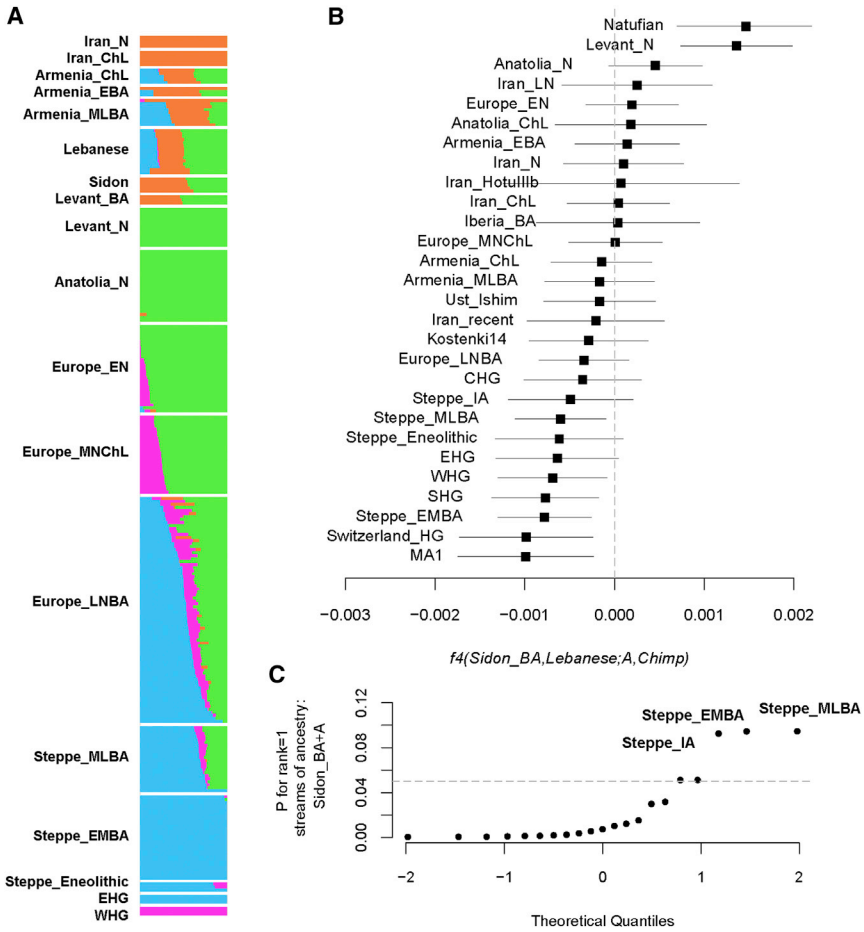

Figure 3. Admixture in Present-Day Levantine Populations

(A) Supervised ADMIXTURE using Levant_N, Iran_N, EHG, and WHG as reference populations. A Eurasian ancestry found in Eastern hunter-gatherers and the steppe Bronze Age appears in present-day Levantines after the Bronze Age.

(B) The statistic *f4*(Sidon_BA, Lebanese; Ancient Eurasian, Chimpanzee) confirms the ADMIXTURE results and is most negative for populations from the steppe and Eurasian hunter-gatherers. We show the estimated statistic value and ±3 standard errors.

(C) Present-day Lebanese can be modeled as mixture between Bronze Age Sidon and a steppe population. The model with mix proportions 0.932 ± 0.016 Sidon_BA and 0.068 ± 0.016 steppe_EMBA for Lebanese is supported with the lowest SE.

the model need not be the actual ancestral mixing populations, and the admixture could have involved a population which was itself admixed with a Steppe-like ancestry population. The time period of this mixture overlaps with the decline of the Egyptian empire and its domination over the Levant, leading some of the coastal cities to thrive, including Sidon and Tyre, which established at this time a successful maritime trade network throughout the Mediterranean. The decline in Egypt's power was also followed by a succession of conquests of the region by distant populations such as the Assyrians, Persians, and Macedonians, any or all of whom could have carried the Steppe-like ancestry observed here in the Levant after the Bronze Age.

In this report we have analyzed ancient whole-genome sequence data from a Levantine civilization and provided insights into how the Bronze Age Canaanites were related to other ancient populations and how they have contributed genetically to present-day ones (Figure 4). Many of our inferences rely on the limited number of ancient samples available, and we are only just beginning to reconstruct a genetic history of the Levant or the Near East as thoroughly as that of Europeans who, in comparison, have been extensively sampled. In the future, it will be important to examine samples from the Chalcolithic/Early Bronze Age Near East to understand the events leading to admixture between local populations and the eastern migrants. It will also be important to analyze samples from the Iron Age to trace back the Steppe-like ancestry we find today in present-day Levantines. Our current results show that such studies are feasible.

Accession Numbers

Sequencing data for 99 present-day Lebanese individuals reported in this paper are available through the European Genome-phenome Archive (EGA) under accession number EGA: EGAS00001002084. Raw sequencing reads for 5 ancient Canaanite individuals are available through the European Nucleotide Archive (ENA) under accession number ENA: PRJEB21330. Aligned sequences and genotypes can be obtained from the corresponding authors.

Supplemental Data

Supplemental Data include 14 figures and 6 tables and can be found with this article online at http://dx.doi.org/10.1016/j.ajhg.2017.06.013.

Acknowledgments

We thank the present-day donors who contributed their samples to this study and bioRxiv readers for helpful comments. M.H., Y.X., P.D., R.M., J.P.-M., M.S., and C.T.-S. were supported by The Wellcome Trust (098051).

A toponomastic contribution to the linguistic prehistory of the British Isles

Richard Coates
University of the West of England, Bristol

Abstract

It is well known that some of the major island-names of the archipelago consisting politically of the Republic of Ireland, the United Kingdom, and the UK Crown Dependencies are etymologically obscure. In this paper, I present and cautiously analyse a small set of those which remain unexplained or uncertainly explained. It is timely to do this, since in the disciplines of archaeology and genetics there is an emerging consensus that after the last Ice Age the islands were repopulated mainly by people from a refuge on the Iberian peninsula. This opinion is at least superficially compatible with Theo Vennemann's Semitidic and Vasconic hypotheses (e.g. Vennemann 1995), i.e. that languages (a) of the Afroasiatic family, and (b) ancestral to Basque, are important contributors to the lexical and onomastic stock of certain European languages. The unexplained or ill-explained island names form a small set, but large enough to make it worthwhile to attempt an analysis of their collective linguistic heritage, and therefore to give – or fail to give – preliminary support to a particular hypothesis about their origin.*

* This paper is a development of one read at the 23rd International Congress of Onomastic Sciences, Toronto, 17-22 August 2008, and I am grateful to the editors of the *Proceedings* (2009), Wolfgang Ahrens, Sheila Embleton, and André Lapierre, for permission to re-use some material. A version was also read at the Second Conference on the Early Medieval Toponymy of Ireland and Scotland, Queen's University Belfast, 13 November 2009. It also covers a small part of the ground of my unpublished paper, "On a recent view of the linguistic prehistory of Europe", read at the Linguistics Association of Great Britain conference, University of Sussex, Brighton, April 1996. I am grateful for magnanimous comment on the ideas by Theo Vennemann, given in the face of nearly twenty years of scepticism on my part about his broader theses. I am indebted and grateful to Paul Tempan for sight of two pre-publication articles of his, on the discovery that we are working with similar ideas, and for his help with obtaining, understanding and evaluating certain Irish sources; and also to George Broderick, both for sight of work which was at that point

unpublished and for comments. Further valuable comments were made by a *Nomina* reviewer. Thanks are also due to Tony Oliver for permission to use his image of a Totronald Stone.

Introduction

This is a philological paper about some of the earliest linguistic evidence for human habitation in the British Isles. Its theme has not been thought up as a plank in an argument for some preconceived theory of settlement history, though its implications for (pre)history must be addressed in due course when the philology has been allowed to speak for itself. The data consists principally of island names without any obvious or any firmly established etymology, and analysis of these is followed by a short foray into the topographical vocabulary of the Celtic languages. The paper does not embody a claim that all mysterious material must come from a single linguistic source; and not all mysterious island-names have been dealt with. There is no discussion of, for example, *Rathlin* (Mac Gabhann 1997: 282) or *Achill (Acaill)*, *Wight* (Romano-British *Vectis*; Rivet and Smith 1979: 487-9), *Bass (Rock)*, *Skye* (Romano-British *Scitis*; Rivet and Smith 1979: 452), *Lewis* or *Fetlar*, the first element of *Shetland* (earlier *Hetland*; Jakobsen 1936: 127-8) or Adomnán's *Sainea (insula)* (Watson 1926: 91), all examples of names arguably not originally formed in any of the historic languages of the British Isles or at any rate not fully understood, but about whose origin the drift of this paper implies no particular claim. The article may be controversial.

The stimulus from other disciplines

Whilst this paper has not been conceived in support of any particular theory of settlement history, we need to present as a backdrop the state of current beliefs about population movements in those remote times. The history of scholarship in this area, and about possible non-Indo-European aspects of Celtic, has recently been the subject of wide-ranging survey papers by McCone (2005) and Broderick (2010); what appears below was written independently of both, and prior to sight of either, but some points in relation to which they are specifically mentioned have been incorporated since the initial draft.

It is commonly accepted that the final glacial advance of the last Ice Age (so far) in the British Isles was during the very cold event called the Younger Dryas (Oppenheimer 2006: 151-155). This was the culmination of the Devensian (in the Alps called the Würm) glaciation, about 12,800-11,500 years before the present and therefore ending by about 9,500-9,000 B.C.E. The glaciers of the Loch Lomond Readvance covered much of southern Scotland and northern England and left the remainder of Britain and Ireland under cold desert or tundra conditions, along with the

exposed floor of what is now the North Sea (Coles 1998; Gaffney *et al.* 2007). At this period, the region now occupied by the islands is believed to have been uninhabited, though the area is known to have been peopled previously, at various times in the Upper Palaeolithic before the Loch Lomond event, e.g. by people bearing the Creswellian culture. These earlier, pre-glaciation, inhabitations are assumed to be of no relevance for the present work.

Stephen Oppenheimer (2006) presents a synthesis of convincing genetic evidence that, after the Younger Dryas, Britain and Ireland were resettled by modern humans mainly emerging from the Ice Age refuge of the Iberian peninsula from about 10,000 years ago onwards. These people(s) had a Mesolithic material culture. Oppenheimer's view is consistent with the archaeological evidence adduced by Barry Cunliffe (1997; 2001), which is interpreted as showing that a succession of material cultures, including those of the Neolithic megalith-erectors responsible for monuments in Brittany and the islands such as Carnac, the menhir of Er Grah (Locmariaquer), Newgrange, Callanish, Avebury, and Stonehenge, spread up from the south along the Atlantic coast to the British Isles. The route may have been maritime or terrestrial, and what alternatives were available depends on the date. We know that the land-bridge joining Britain to the continent was not finally broken till about 6,500 B.C.E. Before that, people and their artefacts could have arrived by either land or sea, and after that only by sea. No position is taken here on Oppenheimer's other claim that there was an influx of people from the east during this period, though in my view there is no linguistic evidence to support it.

Those who headed north as Europe warmed up must have spoken some language or languages. We have no historical knowledge of this period, of course, but we do have some archaeological knowledge of the languages written in the Iberian peninsula before the beginning of the Roman empire (fully set out in Untermann 2001), and that knowledge may act as a proxy for an understanding of the local cultures of the first millennium B.C.E. Some linguists group together these mostly poorly-evidenced and incompletely-understood languages, Tartessian,[1] Iberian, Lusitanian, and Celtiberian (of which the second may have been, and the fourth was, Celtic) as *Palaeohispanic*, a term intended to exclude the late-arriving colonial and economic languages, namely Punic, Greek and Latin. It has been suggested elsewhere (Coates 2009) that the relatively little which is known about the Palaeohispanic languages and about their contemporary, Aquitanian (effectively the ancestor of Basque), offers no insight into the toponomastic prehistory of the British Isles, and all of these languages can therefore be regarded as irrelevant here except insofar as any of them might have been directly ancestral to Insular Celtic. It is interesting that the existence of Celtiberian is consistent with ancient Irish stories in *Lebor Gabála Érenn* 'Book of the Taking of Ireland' ("books" 2 and 8) about Gaelic migration from Iberia, the so-called "Milesian" invasion (McAlister 1938-56; on the relevant archaeology see Cunliffe 1997: ch. 7), though it is debatable what the linguistic impact of an invasion of male warriors might have been (as also observed by Mac Eoin 2007: 117). Direct migration

from Iberia to Ireland is also indicated by a recent ~~archaeological~~ study of edible snail populations (Grindon and Davison 2013), and there are other such biological hints.

Iberia was also home to the colonial and economic languages mentioned above, in the centuries immediately before and after the turn of the first millennium C.E.:

> **North-West Semitic** (NWSem; represented by Late Phoenician, in the form of Punic), in some colonies of Carthage, e.g. Cartagena, Ibiza, Málaga, and Cádiz, on Mediterranean coasts; inscriptions are found even after the year zero, e.g. on coins (Jiménez Díez, forthcoming)
>
> **Ancient Greek**, in some colonies on the Mediterranean coast, e.g. Ampurias, Hemeroskopeion (?Alicante), and Zakynthos (Zakantha; Sagunto)
>
> **Latin**, which eventually occupied almost the whole of Iberia

These languages may open explanatory possibilities where Palaeohispanic and Aquitanian do not.

An insistent question underlying all discussions of the linguistic prehistory of the islands is whether any pre-Celtic language(s) were Indo-European or not. There is little prospect of deriving any relevant information from historical sources as such (as opposed to linguistic forms in those sources). But compensating inferences may also be made from toponymy, in the broadest sense. Most scholars accept that the ancient river-nomenclature of the islands includes a strong Indo-European component which Nicolaisen (2001), following Krahe (1963), calls "Old European", and this component is further analysed by Kitson (1996). Most scholars also accept that most, if not all, of pre-Roman Britain and Ireland spoke some variety of Celtic (*pace* Oppenheimer 2006: ch. 7; for a still-controversial variant of the standard view which does not affect the prehistoric period under discussion here, see Schrijver 2007). It is still uncertain whether all the evidence for Pictish indicates that it was a Celtic language or not (for a survey, see Forsyth 1997). There are certainly non-Celtic or doubtfully Celtic place-names recorded from (especially) northern Scotland (Nicolaisen 2001: ch. 9, esp. 244-245), but whether these might usefully be called Pictish or not is a controversial and for the present unproductive matter.

A pivotal rhetorical role in discussions of prehistory is sometimes accorded to Ivernian or Ivernic, said to have been spoken in Ireland well into historic times and alluded to in Cormac's glossary (*Sanas Cormaic*, 9th/10th century: Meyer 1912; Russell 1988), but this language is not fully recorded and it is evidenced only as a vocabulary source for a formal register of Old Irish. It may have been a P-Celtic language, according to recent thinking, and it cannot safely be concluded that it was non-Celtic. Some scholars of Irish have recently allowed the possibility of the existence of pre-Celtic languages in Ireland, contributing to toponymy, without

conceding explicitly that some particular non-Indo-European language might be involved (e.g. Mac Eoin 2007; De Bernardo Stempel 2007: 138; Tempan 2008b).

It has been known from the earliest times that speakers of Palaeohispanic, Aquitanian, and the languages mentioned in bold type above, which I will collectively call "Southern", could have had an economic incentive to travel as far as the British Isles. That incentive consisted of metal ores, and with varying degrees of probability they may have taken it up. Latin-speakers were simply the last of the line. Greeks from Massilia visited the islands perhaps in the sixth century B.C.E. (an anonymous sailor, as reported by Avienus, though that has been challenged by Hawkes 1977: 17-25), and in the fourth century B.C.E. (Pytheas, as reported somewhat sceptically by Strabo, Pliny and Polybius).[2] The fourth-century historian Ephorus has also left an account of Iberia and the Celtic lands to us, largely copied by Diodorus Siculus,[3] and Hawkes thinks Ephorus, rather than the Massiliote sailor, may have transmitted certain Insular names to the Greeks. Strabo (*Geography* 3.5.11) says that the Phoenicians used British tin and did commerce with the Cassiterides islands (whose location is controversial but has often been claimed to be Scilly). But using British tin does not necessarily mean that they ever came to Britain; it could have been traded overland by intermediaries in Gaul or Iberia. However, in Elizabethan times, the schoolmaster and antiquarian John Twyne (1590) suggested that Phoenician/Punic tin-speculators had indeed reached Britain, bringing the coracle with them. Twyne's biographer calls this "a notion that beguiled much later generations" (Martin 2004). Whilst there is no archaeological or epigraphic evidence for such a visit, actual colonization is taken as a given by Vennemann (2006: 356-357 and n. 40), and a visitation is not inherently implausible. After all, these great seafarers left the Mediterranean to explore the west coast of Africa, possibly at least as far as modern Sierra Leone (Heidelberg University MS. Codex Heidelbergensis 398, folios 55r-56r; see Harden 1971: 163-168), and there is no reason why they could not have turned to starboard at the Straits of Gibraltar instead and hugged the coast of the Bay of Biscay.

In a conceptually related claim, Vennemann (1998b) has suggested that the ancient name of Ireland *Ivernia/Hibernia* derives from Proto-Semitic **'i: weriju:* 'island of copper' (or in his preferred notation $^{+'}$*y-wr'*(*m*); note, however, that Orel and Stolbova (1994: *s.v.*) reconstruct the NWSem root in a metathetic form as **'ariw*-). His argument is presumably meant to recall the Bronze Age copper mines at Allihies, Co. Cork, though despite this possible factual foundation it has not won wide acceptance. Schrijver's cautious derivation of the name (1995: 288) is the latest in a line tracing it ultimately to P[roto-]I[ndo-]E[uropean] **piHwerjon*- 'fat (land)' or similar, and this still seems to be the widely preferred solution, despite some acknowledged unclarity ("A P[roto-]C[e]l[tic] or PIE origin of the formation is uncertain[.]"). Broderick (2009: 165-166) broadly supports Vennemann's idea, and we return to the question below under heading 12.

If there is any substance in the theory that the British Isles were resettled from Iberia after the Younger Dryas, possibly as a chained population movement also driven by the intensifying desertification of North Africa, then our knowledge of these "Southern" languages represents the only hope of being able to offer any linguistic support to any settlement hypothesis arising from the joint venture involving population genetics, archaeology and Irish mythology. Looking for points of systematic resemblance between Insular Celtic and "Southern" would be well motivated in the light of these recent advances. We could (as scholars have done since Rhŷs 1890) look for "Southern" traces in the most problematic grammar and vocabulary of the Celtic languages, i.e. that which has been identified as uncertainly Indo-European (as others have done, unsuccessfully, for a relation between Basque and Celtic; Trask 1997: esp. 368-372); and we could look for links between Iberia and the British Isles starting with the most obscure surviving toponyms in the islands. In this paper we will focus on the toponymic task, but the parallel lexical task will not prove irrelevant; nothing much will be said about grammar, because that is beyond the self-imposed brief.

The toponymic task has been attempted directly by Adams (1980, incorporating earlier work, and ranging more widely than names), and in relation first to one name by Coates (1988b) and then to others also by Coates (2009). A major contributor has also been Theo Vennemann (in many articles cited in this paper), as part of his wider project to establish the existence of a "Semitidic" substrate not only in the Insular languages but also in others elsewhere in Europe. Methodologically, as regards our approach to individual names, the work of Vennemann and myself is similar, but we differ in that I do not find myself able to subscribe to his substrate hypothesis, and we also differ about the interpretation of certain names. The toponymic task has been attempted indirectly by others who have cleared the ground by identifying those toponyms which do not appear to have a Celtic, or an Indo-European, origin without proposing an actual source (De Bernardo Stempel 2000; Parsons 2000; Sims-Williams 2000; Isaac 2005).

The toponymic task can be performed in two ways. We could look at the available evidence of the "Southern" languages (Latin and Greek having already been trawled as far as is reasonable, leaving us with Palaeohispanic and Punic, and possibly others beyond Iberia, a possibility which we do not take into account here) and see whether there is anything that illuminates the most problematic place-names; or we could look at the most problematic place-names and see whether anything reminds us of the minimal "Southern" evidence. In practice, we could do these simple-minded tasks at the same time. But doing them is methodologically problematic: the evidence base at both ends of the task is so small and so semantically restricted that we are unlikely to discover anything systematic, and we are open to the dangers of theorizing on the basis of unsystematizable individual snippets of data. We also need to bear in mind the probability of unknown linguistic changes in the relevant languages between the records of texts and names at different times. Something is known about the history of

Aquitanian/Basque (Michelena 1964 and subsequent work; Trask 1997), Punic (Krahmalkov 2000, 2001 [Latino-Punic especially]; Jongeling and Kerr 2005; Jongeling 2008) and of course Greek and Latin, and a fair amount about Continental Celtic (Eska and Evans 1993; Sims-Williams 2006); nothing is known of the development of the other, Palaeohispanic, languages which we have in any case discarded. We need to bear in mind the risk of the obliteration of some sorts of evidence, especially phonological, when a name is adopted and adapted by speakers of another language, meaning here the processes of celticization. The additional risk of distortion because of completely normal folk-etymological, or analogical lexical or morphological, pressures is constantly present.[4]

We could conclude straight away that we are looking for needles in a haystack even though we are unsure exactly what needles look like and suspect that the haystack contains a few things which look a bit like what needles might look like. It would be foolish to expect anything more than some possibilities to emerge from the present paper, and I do not want to raise expectations. We will be dealing with similarities, in the interpretation of which we risk an excessively naïve account of the little data we have. But it is a task worth doing. If another discipline (here, genetics, backed to some degree by archaeology, history and mythology) produces a serious hypothesis with linguistic implications, then linguists are right to see what light they can shed on the problem. And our own discipline, independently of the findings in genetics, has come up with a serious proposal: as we have seen, Vennemann has proposed in a long series of articles that the vocabulary of northern European languages has both a Semitic-like ("Semitidic") and a Basque-like ("Vasconic") strand.[5] Vennemann's hypothesis (as set out for example in his 1995 and 1998a papers) is at least superficially compatible with aspects of the story told by genetics, archaeology and Celtic mythology. It is against the background of this *prima facie* possibility that I want to explore possible Insular-"Southern" relations.[6]

In this paper, I discuss evidence from one category of names in Britain and Ireland – island-names – that has proved resistant to analysis or controversial. No other single group of names offers so much dark material as a proportion of the total dataset, though I shall mention other names from time to time, and strike off in a new but related direction at the end. A complete onomastic analysis would deal also with unexplained or unsatisfactorily explained river-names (*Humber*, *Severn*, *Farrar*, *Ness*) and personal names and ethnonyms (*Partholón*, *Deirdriu/-e*, *Prasutagus*; *Erdinoi*, *Gangani*, *Silures*, *Iceni*) in the early Irish and Romano-British (RB) record, whether we agree with Nicolaisen or not that some of these may ultimately be non-Celtic Indo-European; and we should also be prepared to consider whether historically unexplained lexical items in Celtic can be etymologized from a "Southern" perspective, a matter to be approached later. But let us start with island-names as a finite and well-defined category.

The Island Mysteries

There are two small sets of difficult island-names each sharing similarities, and these are of particular methodological interest in a study where too much may easily be read into a single name. Here, the default strategy of previous investigators has been to attempt an explanation in terms of known elements in known languages, and that is of course perfectly reasonable: it respects the evidence as we have it. It does not always produce a credible solution, but sometimes it does. The relevance of this section containing datasets 1. and 2. might not be readily apparent after reading, so I justify it here: I have included it as a demonstration that the eventual conclusion of this paper is not based on an attempt to see evidence supporting it in an entire fleet of names, come what may; also as a demonstration that even some of the most difficult names are probably Indo-European; and as a warning that the conclusion is, in the absence of convincingly non-IE patterns in the dataset, necessarily based on the interpretation of a collection of individual names rather than clusters.

1. *Man* and *Môn* (the Welsh name of Anglesey)

We need to examine these names in the present context because of Vennemann's (e.g. 1993: 460-8; 1995) attention to a supposed Vasconic root seen in Basque *mu(i)no* 'hill' and *muna* 'slope, bank' appearing in many European place-names. These words are, however, likely to be Romance borrowings in Basque (Trask 1997: 367, following Corominas and Pascual 1984-91, who propose a Romance stem **bunn-*, later developing an initial nasal by anticipatory assimilation; Trask: 140), and if that is the case Vennemann's suggestion that these words may appear in a number of Vasconic place-names in Europe is fatally compromised.[7]

Man and *Môn* have often been confused, partly for phonological and orthographic reasons and partly because the islands share the Irish Sea with each other. Despite massive orthographic variation in the sources, philology demands that *Man* be referred to a British **Manaw(j)ā* (see Rivet and Smith 1979: 410 for a summary of discussion up to that date). Such a form may also be responsible for the name *Manaw Gododdin (Manau Guotodin)*, an early-recorded district at the head of the Firth of Forth, and for Irish names of the type *Mano* (Loth 1934). There seems no reason to give credit to Pliny's unique spelling *Monapia*. Rivet and Smith refer **Manaw(j)ā* to a root meaning 'high'. It might be cognate with the root of British **monijo-* 'upland' which may also be seen in *Mona*, *Môn*; De Bernardo Stempel (2007: 158) actually suggests that the name of Man means 'the one related to Mona [i.e. Anglesey]'. The relation might be underpinned by the well-evidenced change of [o] to [a] before a resonant consonant when followed by another [a] (Schrijver 1995: 94-97), and if that is right then the name is Celtic, specifically Brittonic. Rivet and Smith cite continental analogues. Broderick (2006: xi) offers a more cautious "Indo-European" suggestion involving the root **men-* 'rise', and Hamp (2003) suggests more specifically for Anglesey **mon-ā* 'the high one'. These three ideas are compatible (though in part

curious, since Anglesey is not literally high at all; presumably Holyhead Mountain /Mynydd Tŵr on adjacent Holy Island, intervisible with Man, was meant).

> Verdict: *Man* and *Môn* are probably Celtic, and almost certainly Indo-European even if not Celtic. *Môn* may be British of an archaic (derivational-) suffixless morphological type. No relevant root is known in the Palaeohispanic languages. Indeed neither Iberian nor Aquitanian/Proto-Basque has root-initial */m/, and their prehistoric forms would therefore be incapable of transmitting lexemes beginning with /m/ to other languages.

2. *Eilean Arainn* (Isle of Arran) in historic Buteshire, Scotland, an old dative form where the *-n* is part of the inflectional suffix
   Oileáin Árann (Aran Islands) in Co. Galway, Ireland; base name of the largest island: *Árainn*
   Árainn Mhór officially, earlier simply *Árainn* (Arranmore) in Co. Donegal, Ireland

   In forthcoming work, Paul Tempan identifies other possible instances and lists earlier published views on their origin.

It is very tempting to associate these three island-names with each other, despite the short vowel in first syllable of the Scottish name as opposed to the long vowel in the two Irish ones. Flanagan and Flanagan (1994: 17) suggest, using a rather careful wording, that the two Irish names embody Irish *árainn* 'ridge'. Watson (1926: 87) suggests Irish *áru* 'kidney' for Arranmore in Donegal, citing its shape. The eye of faith could no doubt see reason for both suggestions, but neither 'kidney' nor 'ridge' is wholly convincing for the Donegal name, and a view from a very high-flying bird's eye is needed before the island in Bute appears kidney-like. Watson adduces some Welsh names with a historic short vowel, of which one is that of a river, one is applied to two adjacent hills, and one with a diminutive suffix is again a pair of adjacent hills. Owen and Morgan (2007: 17-18) are confident that the hill-names can be derived from a diminutive form *aran* 'little ridge' (like others mentioned by Thomas 1938: 180); *Arenig* would contain therefore a double diminutive. The variety of topographical applications is troublesome, as is the phonological disparity. 'Ridge' is arguably suitable for Aran and the hill-names in Wales, and a generalized 'elevation' word would suit Arranmore, as this stylized representation from the island's publicity machine (arainnmhor.com/Arainn_Mhor_Island/Welcome.html) suggests:

An etymological long vowel is compatible with the Irish names but not the Bute *Arran* and the Welsh hill-names.

> Verdict: no single solution seems possible, and the origin of all these names is best left an open matter. Purely (or implicitly) Celtic solutions have been proposed, notably by Ó Móghráin (1944), and also by Ó Máille (1957); Fraser (1992: 9-12) is non-committal. The material does not appear to offer any support for a "Southern" origin.

Island names in a Semitic perspective

Those two name-groups were examined first as the best candidate *groups* for offering possible interpretations of a non-Celtic type.[8] The result was negative, and in the absence of other such groups we are now methodologically compelled to examine singletons, individual island-names which might hold out some promise of revealing their origins through a "Southern" magnifying-glass. What might give us some preliminary confidence that this is worth doing, after the setback of 1. and 2.?

3. *Uist*

Over twenty years ago, I suggested in a short paper (Coates 1988b) that there might be an etymological link between *Ibiza* in the Balearic Islands (Catalan *Eivissa*; *Ebusos* in Manilius and Pliny and *Ebousos* in Didorus Siculus) and the two nearly adjacent Hebridean islands called North and South *Uist* (Scottish Gaelic *Uibhist*, /'iβiʃtʲ/, with characteristic initial stress). I followed Hübner in the first edition of *Pauly-Wissowas Real-Encyklopädie* (1905) in proposing that *Ibiza* represented a Semitic name possibly meaning 'island of some fragrant plant, e.g. balsam or pine' (cf. the Proto-Semitic root **bšm* 'balsam' (Jongeling 2008: 315, 386) and the island-word **'y* mentioned at several points below (Jongeling 382).[9] I suggested that *Uist* had the same origin (not ruling out the possibility of transfer, i.e. naming-after), and that it gained its modern final /t/ under analogical influence from Old Norse *ívist* 'inner dwelling', this form actually being on record (as *Iuist* in *Orkneyinga saga*; Pálsson and Edwards 1978) as the Scandinavian name of the islands.[10] Armed with this hint of a "Southern" origin (to put it no more strongly than that), we shall look closely at some of the remaining obscure names.

It needs to be made very clear what assumptions are being made about the language(s) adduced for comparison with the island-names. I shall use the term *Proto-Semitic* [PrSem] as a way of characterizing lexical roots without suggesting that the names discussed must go back literally to the date when reconstructed Proto-Semitic was a spoken language. More specifically, the term should be understood, as the default, as meaning the branch consisting of the daughter language, reconstructed Proto-North-West-Semitic [NWSem] and its attested descendants Phoenician and Punic, and understood to be non-dogmatic about the morphology of forms cited where no more

detailed hypothetical word-structure is proposed. Where a Semitic element is mentioned as being potentially etymologically relevant, it should be assumed without further qualification, if none is given, that the argument depends on whatever phonological form that element had in one or other of these North-West Semitic languages, even where that form is not available to scholarship; and of course therefore, if we can be sure that some element was absent from (not merely unrecorded in) NWSem, any argument based on it falls by the wayside. I am well aware that lack of specificity about morphology could lead us into the potentially sterile territory of root-etymology, overlapping the zone characterized by Voltaire's famous (if apocryphal; Considine 2009) jibe about consonants counting for very little in etymology and vowels for nothing, but I take the risk of presenting a set of data whose cumulative rather than item-by-item relevance can be assessed, reducing the risk of a false positive but not eliminating it.[11]

4. *Iona*

Iona (more correctly *Ioua*; Old Irish *Í*, sometimes spelt with a decorative initial <H>), site of the sixth-century monastic foundation of Columba at the south-western tip of Mull in the Inner Hebrides, has a name of unknown origin. It can scarcely mean 'yew' as Watson (1926: 89) suggests, unless the name was copied from elsewhere; there is no evidence on this well-excavated island for yew at any period, and it has always been notoriously barren. Sauren (2005) documents an epigraphically well attested Punic word, the most usual variant of whose base-form he analyses as *'y*, meaning 'island, isolated place'. Sauren notes that the word appears in royal correspondence of Rib-Addad from the Phoenician city of Byblos as *iw* (2005: 279-280, quoting the form from Moran *et al.* 1987; morphology unclear to me), which if it authentically represents PrSem brings us somewhat closer to the name of Iona as known to history.

Although there is little indeed to go on phonetically, it is not beyond possibility that this root is what is represented in *Ioua*: 'the island *(par excellence)*'. If the form *Ioua* contains, morpholexically speaking, more than *Í* does, rather than simply a now-silenced root-integral /w/, then perhaps it is a lost second element. In several places, Vennemann has suggested other island-name etymologies with the structure PrSem **'y + xxx*, i.e. with a generic-first structure, which does not appear to be *a priori* unreasonable, whether eventually shown to be correct or not.[12] A risk to be aware of is that of projecting the religious pre-eminence of the island back into pre-Columban times as justification for a simplex name applied *par excellence*; but then St Columba may have chosen (or have been granted) the island precisely because of some earlier sanctity.

5. *Seil*

An island called *Sóil* is recorded in the Irish *Book of Leinster* (Watson 1926: 41). This is generally acknowledged to be the one called in modern Gaelic *Saoil* (English *Seil*),

in the Inner Hebrides. No etymology has been proposed, as far as I know, but it seems worth comparing the ancestor of Arabic *sāḥil* 'coast', PrSem root **šḥl*, with the well-known specifically NWSem rounding of *[a:] responsible for the Irish form, perhaps with the diphthong created by consonantal elision ultimately identified with OIr <ói> from PIE **ai*. This is not as fanciful or redundant, semantically, as it might sound; Seil is the closest of all the Inner Hebrides to the mainland, and it is linked to it by Clachan Bridge (built in 1792-3), which the local tourist office claimed, until the opening of the Skye Bridge in 1995, to be the only bridge in the world over the Atlantic Ocean (as illustrated below). A name meaning 'coast island' is hardly unreasonable in the circumstances.

Clachan Bridge

The Atlantic Ocean from Clachan Bridge

6. *Islay*

The name *Islay* in the Inner Hebrides is of doubtful Celticity (see Watson 1926: 86-7, who offers some problematic comparisons). It appears as *Ile* or *Ila* in ancient Irish literature, as *Ilea insula* in Latin, and in modern Gaelic it is *Eilean Ìleach*. Here, too, with only a single consonant to play with, there is little to go on. One might consider the unexplained name of the ancient town of *Ilipa* near Seville in Tartessian territory, suggesting that the *-ip-* in this might represent the only securely identified suffix in that language, and that we are therefore dealing with a root of the form **il-* in both cases; but there is no strong reason to do so. Let us take into account the notable and ancient European propensity to regard lands and islands in the west – real or otherwise – as sacred in one way or another (e.g. Elysium; Plutarch's Fortunate Isles; the Celtic Otherworld represented by Tír na nÓg, Mag Mell and Annwfn; Avalon; Diodorus Siculus's Hyperborea; Scilly; Anglesey; Blasket; the cemetery islands *(reilig)* in the Bristol Channel), and observe that Islay is the westernmost in its sector of the Inner Hebrides. Following through the hints of Semitic naming above, we should therefore not rule out a connection with the root of the divine word or name seen in Phoenician *'l*. The second syllable in the modern name might be attributable to an extended form of this root comparable to those seen in Hebrew *'Eloah*, Biblical Aramaic *'Ĕlāhā* and Arabic *Aḷḷāh* (< PrSem **al-'ilāh*) 'the god, God', reduced in the absence of stress in Gaelic and therefore different in outcome from that of the stressed

*/a:/ argued to be possible in the case of Seil. Maybe here too we have survival of the generic **'y* in initial position, and merger of the adjacent similar vowels, thus 'island of the god'.

7. *Mull*

Mull is probably recorded in the *Ravenna Cosmography* as *Malaia*, and in Ptolemy's *Geography* as *Maleos*. Watson (1926: 38) gives a convincing phonological account of the development of the modern form in Gaelic, *Muile*, and thus English *Mull*, from some such form. He offers a Celtic etymology from a root meaning 'praise', backed by a rather strained metaphorical speculation about an application of this root in the sense 'lofty'. De Bernardo Stempel (2007: 153) suggests the meaning is 'the evil one' (< presumed Common Celtic **mḷ-yo-s*), which is formally acceptable, but she offers no motivation. If these suggestions are considered semantically somewhat contrived or undeveloped, it is worth reserving consideration for the PrSem **mlḥ* 'salt': cf. Hebrew *mallûaḥ,* a salt-marsh plant (?marsh *mallow*, to which this word is evidently related through Latin *malva*; perhaps Ptolemy's form, and indeed Ravennas's, is for earlier Greek **Malewos*). Whilst Mull is not archaeologically known for sea-salt production, it certainly has saltmarsh (Gillham 1957), which is the prerequisite for the industry. Several such marshes on Mull are mapped by Burd (1989), though none is a large one, and the presence of small areas of saltmarsh in the Western Isles is not unusual.

We should not overlook the phonologically interesting PrSem root reconstructed by Orel and Stolbova (1994) as **malaw-* 'desert', but its credibility here depends on what sorts of agriculturally useless terrain the term could denote at the relevant period, and in what areas.

8. *Scilly*

It has been suggested by Rivet and Smith (1979: 459) and Thomas (1985) that *Scilly* could be related to that of the deity *Sūlis* commemorated in *Aquae Sulis* (Bath), but the Classical sources are united in showing <i> in the initial syllable, and this <i> is too early to reflect the Brittonic change of [u:] > [i:]. Vennemann (1999a: 40-2) has proposed instead that this name, which has a very diverse and inconclusive record of spellings, might be compared with a PrSem root "**s-l-*" meaning 'rock, cliff', as seen in Hebrew *sela'* (cf. Orel and Stolbova 1994: **sulVḥ-* 'wall'; Militarev 2006: entry 1347, PrSem **šalḥ/*šulḥ-* 'wall').[13] With mean sea level in the Western Approaches as it is at present, Scilly has plenty of rocks, but not much notable cliff except on the northern fringe. Some time ago, when considering the name of The Solent (Coates 1988a), I evaluated some of the same evidence without finally coming to this conclusion. But once we have taken the step of deciding to examine evidence suggesting the presence of PrSem more inclusively, we should not rule out this possibility *a priori* for *Scilly*. If the idea is valid, the name could be that of the

prehistoric single island out of which most of the islands of the present archipelago have evolved, originally denoting its most striking feature, namely the now barrow-clad lowish hills which end in the cliffs of the northern coasts of the most northerly islands in the group, Bryher, Tresco, and St Helen's.

We should not overlook that the name of the Punic site known to the Romans as *Zilis*, *'šlyt* (Jongeling 2008: 319), modern Asilah, Morocco, with possibly suffixal *-t*, offers a parallel which is perhaps formally even more acceptable because of the universal front vowel in the record in the first syllable. Solá-Solé (1958: 11) suggested that the correct reading is in fact *'slyt*. This name has been interpreted as 'fishery'.

9. *Ebudae (Hebrides)*

In the same article (1999a: 46), Vennemann also suggests a PrSem origin for the ancient name of (some of) the Hebrides *(Ebudae)*, involving the plural of the generic **'y* we have seen previously (**'yym*[14]) and a specifier related to one of two PrSem roots of the form **phd*, namely 'lamb' and 'fear'.[15] He avoids the difficulty of the general loss of prehistoric */p/ in the borrowing Celtic languages by proposing that */m-p/ is rendered by Ancient Greek <β>, and that a reflex of this is what surfaces in the attested forms. This seems to rely heavily on the inverse analogy of Modern Greek spelling conventions, where /b/ is rendered <μπ>, and for me it undermines the proposal. Formally, the same result could be got by taking the /b/ to result from a generalized early Old Irish eclipsis (prehistoric nasalization resulting in voicing), but that depends on the idea that when Gaelic speakers encountered the Hebrides they retained an initial /p/ in the local name which followed the plural generic, and treated it morphophonemically in a way analogous to native words with initial /t/ and /k/. But this is chronologically impossible, since *Ebudae* is recorded long before eclipsis (5th-6th centuries C.E.) could have affected the name. It is clearly semantically and toponomastically attractive to consider a possibility including a word for 'lamb', viewed in the light of the various Scandinavian 'sheep islands' of the north and west, such as the *Faroes*, *Fair Isle*, and more than one *Soay* and *Lambay*, the Gaelic *Eilean nan Caorach* 'island of sheep' in Durness, Sutherland, and the English *Sheppey* in Kent, not to mention a number of island allusions to goats.[16] But if *Ebudae* is evidence for such an etymology, the <b> needs to be accounted for within PrSem, or by simple Greek sound-substitution of [b] for PrSem *[p], and the jury is out.[17]

De Bernardo Stempel (2007: 155) suggests instead that the name is a modification of *Epidion*, an island-name in Ptolemy's *Geography*, but like Vennemann she has to resort to the unmotivated early phonetic development [p] > [b] (i.e. not a process akin to systematic early Brittonic lenition) to account for it.

10. *Thanet*

Vennemann (2006) explores the possibility of a PrSem origin for *Thanet*, at the north-eastern tip of Kent. I previously noted (Coates 2000: 32-39) that such a possibility was suggested in the past (Henning 1925), but did not pursue it, in a paper whose main topic was the alternative recorded name for Thanet, *Ruoihin* or the like, and in that paper I also argued against previously-suggested Celtic etymologies. Vennemann's more detailed work on this suggests that I may have missed an opportunity. He concludes that the name enshrines that of the Phoenician goddess Tinnit (Jongeling 2008: 379) with the name vocalized in the traditional way as *Tanit*, and offers analogies for the appearance of her name in an island-name and without a generic, citing Coates (2000: 35) for some philological detail. He suggests that the now widely accepted reconstructed form *Tinnit* may be related to an earlier form vocalized like *Tanit* by regressive vowel-assimilation, and cites analogues. He quotes Krahmalkov (2001: 35-36) as saying that "[p]retonic reduction was characteristic of the construct noun", though without saying how plausible it would be for the name of a goddess to appear in the construct state (i.e. approximately as the "possessed", like *top* in the phrase *the top of the mountain*). Bearing in mind that the name of the Assyrian analogue goddess appears in Greek as *Tanaïs*, he feels confident in asserting that the relevant etymological vowel in the Punic name is <a>, and that this is what appears in the name of Thanet.[18] The word for 'island', *ʾy*, already noted elsewhere, remains implicit in the attested forms. He cites parallel theophoric island-names elsewhere in the Punic world.

11. *Sark*

In work on the ancient names of the Channel Islands (Coates 1991: 73-76), I regarded the ultimate source of *Sark* as unknown. But its early attestations suggest a root which could be rendered in documentary Latin as **Sarg*-. One might compare the PrSem verbal root **śrq* 'redden; rise (as of the sun); east' (cf. Modern Arabic *šarq* 'east'). Sark is the easternmost, and outermost, island of the geological group of which Guernsey is the largest.

12. *Éire*[19] and *Britain*

Probably the most tantalizing pair of island-names in this selection is the one consisting of those of the two main islands in the archipelago. They may indeed be a pair rather than a random twosome. In the face of the fact that there is no universally agreed Celtic interpretation (also Broderick 2009: 153-154, 157-158), Vennemann (1998b) proposes that the ancient name of Ireland *Ivernia/Hibernia* derives from PrSem **ʾi: weriju:* 'island of copper' (or in his preferred notation $^{+}$*y-wr'*(*m*), though note that this Semitic term appears to be Akkadian only (PrSem **w/ʔVrVw/y*-; Militarev 2006: entry 1427)). Broderick (2009: 160) recalls that Kurt Sethe, in a note in Schulten (1950), suggested a relation between transliterated Coptic *πίθραν* 'tin' and at least one variant of the traditional name of Britain (*Prydan*, presumably meaning

the British stem **Pritan*-, RC). Broderick articulates fully the suggestion that *Britain* is to be interpreted as 'island of tin' in some Hamito-Semitic language (which we label here PrSem). Copper + tin, of course = bronze, which relates directly to one of the main purposes of pre-Iron Age long-distance trade. I do not repeat his argument fully here, but on this basis Broderick suggests that both names may have been Semitic in origin. The most attractive feature of his argument is their semantic congruity: the materials they denote are mutually relevant in a way which makes a shared source more likely. I have only one reservation: namely that, even if **Pritan*- (and more indirectly *Britain*) and *πίθραν* are related, it is impossible to be certain whether Britain bears a name meaning 'tin [place]' of PrSem origin, or whether the Coptic word means 'British [metal]' and is therefore a borrowing from some Insular language. Nonetheless it is clear that Broderick's suggestion should not be casually dismissed.

13. *Bute*

This island-name is discussed in a section devoted to Celtic lexis below.

14. *Thule*

A weak root-etymological possibility to explain the name of this far northern, perhaps imaginary, land, is a connection with PrSem **tl* 'become dark, shaded' (Huehnergard 2000), which could be understood as an obvious reference to the long winter nights emphasized along with long summer days by Pliny the Elder in his *Natural history* (4,16).

Evaluation

I must emphasize again at this point that observations 3.-12. taken together (with or without 13. and 14.) do not amount to a proposal with worked-out ethnological or historical consequences. They are suggestive juxtapositions of some ancient and modern island-names with some ancient roots, in some instances with account taken of their inflected forms. In some of the cases dealt with so far, the morphology of the suggested original name is not fully elucidated. But there are hints of a philologically consistent account. None of the lexical content proposed in these constructions is onomastically outrageous: the denotata suggested are: island, coast, cliff, an aromatic tree, a marsh-plant implying the presence of salt, a compass-point, culturally significant metals, and divine words/names for which river-names derived from Celtic like *Dee* 'goddess' or *Boyne* 'white like a cow' might be adduced as partial analogues. Quite a lot of this content can be tied to geographical or cultural realities, as spelt out in detail above. As regards onomastic elements and syntax, it might be inferred that some of the names originally contained, or still contain a reflex of, a generic elsewhere rendered **'y* 'island' in a head-first structure (*Uist*, *Iona*, *Éire*, and perhaps *Islay*). There are some hints of contact effects in the phonology, though of an

unsurprising kind, given what we know about the segmental inventory of Common Celtic (Lewis and Pedersen 1937: part I), viz. the non-transfer into Celtic (elision) of PrSem *ħ (*Seil* and perhaps *Ebudae*) and PrSem final *h (*Islay*), the substitution of /s/ or /s'/ as appropriate for PrSem *š and *ś (*Seil*, *Sark* and probably *Uist*), and the elimination of a PrSem uvular(ized) consonant in favour of a plain one (*Sark*, perhaps *Thule*). In one name (*Seil*), it is possible to see a rounding of the PrSem vowel */a:/, and in one further case where rounding might be expected, we can suggest that its absence is due to the position of stress in Gaelic (*Islay*). A direction is emerging: with whatever diffidence these onomastic suggestions are put forward, Proto-Semitic at least provides a worthwhile point of comparison for some of the most difficult names in Insular toponymy, and I shall suggest below some further evidence that points in the same direction. The claimed celticity of *Bute* will be reviewed below with the result of allowing it to take its place as 13. above.

Island-names and other non-IE evidence

15. *Coll*

The island of Coll in the Inner Hebrides is recorded twice as *Colosus* in Adomnán's *Life of Columba* (Sharpe 1995; cf. Watson 1926: 84-85). Any form with an intervocalic [s] is a problem to explain in Celtic, and Watson accordingly suggests it might be pre-Celtic, and therefore somehow bypassing the loss of [s] in Celtic. Accepting the danger of identifying this form naïvely with Greek *kolossós* ('giant figure', of uncertain origin, not originally Greek; see most recently Lindner 2003: 107), we should firstly note that, helpfully, an original */ss/ would not disappear in Celtic as a singleton medial */s/ would, and we should secondly by no means rule out the possibility that there could have been a large standing stone of humanoid or at least personifiable shape here, even if now destroyed, as there still are on other Hebridean islands such as North Uist and Lewis. There are at present two medium-sized stones, the Totronald Stones (personified in Gaelic as *Na Sgeulaichean*, 'The Storytellers'), 5' and 6' tall. These underline the possibility of lost earlier stones of such a type even though they are themselves not exactly convincing as human figures (RCAHMS 1980). The actual spelling in Adomnán, with one medial <s>, suggests that this is not a simple instance of an obscure name being associated with a well-known word in the classical tradition and spelt accordingly. It probably does not represent the Latin adjectival suffix *-osus* because Adomnán does not use the form adjectivally in the relevant passage.

One of *Na Sgeulaichean.*
© Tony Oliver, Coll Digital, reproduced with permission

The name could have been given at any time when *kolossói* were a well-known feature of Hellenic and therefore Mediterranean culture, perhaps, more interestingly, by speakers of an unknown language in which the ancestor of the word was a native term, or one into which the word had been borrowed. That does not rule out Punic transmission. This suggestion leaves the island-name without a generic, but there is no shortage of other islands in the Western Isles whose current names have no apparent (surviving reflex of a) generic term: Seil, Lewis, Rum, Eigg and Mull, for example.

Coll is often, and traditionally, explained as deriving from Gaelic *coll* 'hazel', despite Watson's resistance. It is true that hazel is a component of the native flora of certain islands in the Inner Hebrides (Gilbert 1984; Coppins, Coppins and Quelch 2002), but the modern word alone does not fully explain the form of the name in the *Life of Columba*.

Some wider ramifications: Celtic lexis

It is time to take stock. As noted earlier, there is no evidence for any Palaeohispanic impact on island nomenclature, except to the extent that the "Southern" presence of Q-Celtic Gaelic may itself represent a strand of such evidence if it arrived in the islands from Iberia. We have also seen that the same island nomenclature offers no support at all for Vennemann's Vasconic hypothesis, but Vennemann himself would not expect his Vasconic herdsmen to be involved in the naming of island habitats (personal correspondence, 18/08/2008).[20] A Semitic contribution to toponymy has

been suggested on purely philological grounds. There is some further tantalizing evidence beyond what I have presented here which suggests that a Semitic connection should not be dismissed out of hand, and which tends to make the suggestions above less incredible. Beyond the small fistful of singleton island-names just presented (*Uist*, *Iona*, *Seil*, *Islay*, *Mull*, *Sark*, and perhaps *Scilly*, *Ebudae/Hebrides*, *Thanet*, *Éire* and *Britain*), there are further hints of contact with Semitic, this time in the common topographical and habitative vocabulary of Celtic and other place-names of the Celtic-speaking lands.[21]

The Proto-Celtic **ros-* is semantically problematic, having the meanings 'promontory' and 'moor' (Padel 1985: 199-203). Within Indo-European, a single possible Indic cognate has been suggested (Sanskrit *prasthas* 'plateau', = lit. 'that which stands forth'). But the first of these senses, which seems to be the earlier (in each of Irish, Welsh and Cornish), invites comparison with PrSem **ra'š* also meaning precisely 'headland, promontory', in the specifically NWSem form with a backed, rounded and raised vowel (Phoenician **rōš* 'head, headland'; cf. Jongeling 2008: 405); cf. the note on Seil above whose suggested etymology may call for the same rounding of */a:/ (but here from earlier */a'/).[22] It is conceivable that such a borrowed word may have been influenced by, and merged formally with, a distinct Celtic word having an original short vowel, since the vowel in the 'promontory' word was originally short in Celtic.[23]

Another height-word in Semitic is **rām*[24] as in the modern place-names *Ramat Gan*, Israel, and *Ramallah*, Palestine (PrSem root **rwm*). It has been cautiously suggested that this might be seen in the Cornish place-name *Rame* which may allude to the conspicuous conically-shaped hill on a headland in this parish guarding the entrance to Plymouth Sound, whose modern pronunciation can be explained in terms of local English dialect conditions (Coates 2006: 7-8). The same root might be seen in a vocalically different form in the name of the island of *R(h)um* (recorded in the *Annals of Ulster* ostensibly in 677 in the genitive form *Ruimm*), whose name is not satisfactorily explained. Mac an Tàilleir (2003) is willing to call it "pre-Gaelic" in defiance of a *prima facie* formal case for Gaelic *rùim* 'space' (whose relation to Old Norse [ON] *rúm* 'room, space' is unclear) and of an earlier Indo-European proposal by Stokes, quoted by Watson (1926: 95, n.3). Rum happens to have mountains among the highest anywhere in the Western Isles except the Cuillins group on Skye and Ben More on Mull, including therefore the highest non-Cuillin peak except the latter. (Rum's is Askival, 2664', 812m.) Haswell-Smith (2004: 138-43) agrees that *Rum* is "probably" pre-Celtic, but notes that alternative suggestions have included Old Norse *rúm-øy* 'wide island' (with the generic vanished from the record; not compatible with its appearance in the *Annals of Ulster*) or Gaelic *"ì-dhruim"* 'isle of the ridge' (also falling foul of the spelling in the early record; dismissed already by MacBain 1922: 77). In any case, it is difficult to think of Rum as "wide" since it is mountainous from every angle and has no "width" distinct from its "length": it is subcircular, or in Whitley Stokes's view *rhomb*oid.[25] This configuration also rules out a single

perceptually dominant ridge. I therefore follow Mac an Tàilleir. Perhaps whilst */a:/ may generally give Celtic */o:/ (see Seil above and **ros*-), it is conceivable that it was raised to *[u:] in the borrowing process where an original [w] followed. Paul Tempan suggests in correspondence (26/06/2010) that the name of Ram Head near Ardmore, Co. Waterford, may be analysed in the same way. Its Irish name is *Ceann* or *Carraig an Ráma*, and the final element has no known early forms and no known Irish etymology (Power 1907: 68). The headland is a less dramatic formation than the others mentioned here, to judge by photographs I have seen, but by compensation it is the extreme south-eastern tip of Ireland and therefore a seamark of the greatest conspicuousness and importance.

~~There is a problem with Cornish *tor* 'belly', which seems to appear in place-names referring to hills, like its Welsh counterpart *tor* and the Irish *torr* represented in such place-names as the *Torr*s in Culfeightrin, Co. Antrim (Mac Gabhann 1997: 149-151, 206-207). There is an (originally dialectal) English word *tor* applied to rocky outcrops or crags, and this is widely believed to come from the Cornish word (as mentioned by Padel 1985: 221-222), though probably incorrectly. The semantic aspect of this idea is problematic, and it is open for us to wonder whether the English word is really an application of PrSem **ṭur* (Phoenician <ś/š-w-r>'rock'), as seen in the name of the city of Tyre, Lebanon (modern Arabic *Ṣūr*), on its offshore rock, transmitted through a non-Cornish channel. Padel notes the difficulty that *tor* does not appear in Cornish with the sense of 'tor, crag', which creates a serious problem in any theory of the transmission of the term to English. But formally, there is no problem: **tor*, a feminine noun, could be for "British" **turā*, a formally celticized version of **ṭur*.[26] Militarev (2006: entry 328) reconstructs the PrSem etymon as **ṭ̣u/ir* [sic; 'flint, rock'], though that form suggests Aramaic (cf. Biblical Aramaic *ṭūr*) rather than Phoenician/Punic; others reconstruct it as **šur/śur*. If the latter scholars are correct, this suggestion does not necessarily fall; maybe the relevant Semitic sibilant was heard as sufficiently different from British initial *[s] to be given a different treatment, and replaced by the corresponding plosive; the British *[s] was after all of such a character that it became [h] in the first couple of centuries after the year zero (Jackson 1953: 517-520; Schrijver 1995: 382), and British had no *[ʃ] or similar sibilant. On the other hand, we have suggested above (5., 11., *ros*) that such a fricative may elsewhere be replaced by Common Celtic */s/. The argument about *tor* therefore depends on the correctness of (my interpretation of) Militarev's position, and should perhaps be discounted as the weakest of the suggestions in this paper.~~

Neo-Brittonic **bod*- 'dwelling' (Welsh *bod*, Cornish *bos*; British **bot*-) can be compared directly with PrSem **but*- 'hut' (Orel and Stolbova 1994, *s.v.*) and, as a feminine noun, it is consistent with a Proto-Celtic **butā*. Padel (1985: 25) suggests that the Brittonic word denoted or connoted a dwelling-place of humbler status than **treβ*-, the standard word for 'farm' or 'village' in the Neo-Brittonic languages. *Botis*, the name generally taken to be that of the island of Bute in the *Ravenna Cosmography* has been analysed by Rivet and Smith (1979: 273) as being root-identical with the

'dwelling'-word. A case can be made on formal grounds, and 'dwelling(s) island' might imply an entire territory marked by a difference of status expressed in building technology, or simply naming from a, or the, prominent settlement. On the grounds of a formally strong phonological similarity here, *Bute* is allocated a place in the candidate list at 13. above.

The much-discussed OW *cair* 'fort; (later) village', Cornish *ker* 'univallate curvilinear hillslope enclosure; village', Breton *kêr* 'village' (Padel 1985: 51), still has no generally accepted explanation. Schrijver (1995: 447-448) suggests a connection with Old Irish *cathir* (genitive singular *cathrach*) 'fortress, fortified town', which is semantically beyond reproach but phonologically difficult despite the similarity being "too striking to be accidental": the loss of [θ], or its transmutation into [j], remains unexplained. Derivation from Latin *quadra* 'square' (Pokorny 1949-50: 135) suffers from essentially the same phonological difficulty, as well as a semantic shift that is not outrageous but requires some justification. James (2007-) derives *cair* from a British **cagrā*, making it root-cognate with Welsh *cae* 'field', reviving an earlier suggestion by Loth (1903: 299), who had acknowledged its provisional status, remarking: "Je ne vois aucun moyen sûr de se tirer d'affaire avec *caer*." The suggestions of Loth and Pokorny were characterized by Padel (1985: 50) as the best suggestions available at the time of writing for a "difficult" derivation. Whilst I am fully in sympathy with the drive to provide a Western etymology, given the lack of agreement and for the purposes of the present context the word can be compared with the PrSem root **kpr* 'village' (not recorded in NWSem, but cf. Ancient Hebrew *kāpār* (bound form *kəpar*), Modern Hebrew and Syriac *kfar*, Arabic *kafr*, Huehnergard 2000: *kpr*[2]; Orel and Stolbova 1994 give a base **kap-* 'house'[27]), with regular pan-Celtic loss of /p/ from a form like */kapir/, */kaper/. That would, of course, continue to leave it isolated from Old Irish *cathir*.

Final considerations

The suggestions in the previous section of the paper, like the earlier toponymic ones, are advanced with all due caution. It is possible, of course, that resemblances between Insular toponymical and topolexical material on the one hand, and firmly-established PrSem lexical roots on the other, are coincidental, but for me, there are too many to dismiss those resemblances casually. In a small way, the suggestions also display phonological consistency, especially as regards the possible treatment of */a:/ and the treatment of non-plain (i.e. uvular and other emphatic-series) consonants (they are lost if they are back fricatives and de-emphasized, i.e. de-uvularized, if they are plosives). The range of voiceless fricatives and affricates is reduced. But I have touched only lightly on the question of how PrSem consonant phonemes might have been represented in Celtic. The mentioned possibilities should be treated with caution, of course, because they reflect back, in part, the constraints of phonological plausibility I imposed on myself when searching PrSem sources. There may be inconsistencies in the implied phonological development of some of the items discussed here (as

implicitly in *Rame* and *Rám* vs. *Rum*), but need not be if one allows for alternative vocalizations of the root, for either lexical or grammatical reasons. There is hardly anything that can be said on the basis of this evidence about vowels, or about morphology, that of Semitic being of course typologically quite different from that of Indo-European. All that remains is the possibility of glimpsing through a glass darkly the lexis of a language used in the British Isles in periods of settlement more remote than we can see through the lens of the known languages of the area.[28,29]

In making all these suggestions, I have proposed or implied no particular cultural context except the general probability of the settlement of the British Isles from the south, and deduced from evidence the possibility that one linguistic strand in that settlement might be represented by North-West Semitic with no detailed regard for the reasons that might have taken it there.[30] But we cannot leave this important issue up in the air.

The main aim of this paper has been to allow a modest amount of obscure data to speak for itself, from a purely linguistic perspective and with only limited amplification. But it is difficult to leave an argument which carries unexplored implications for prehistoric population movements or trading relations hanging in the air. At very least, we must think about what *sort* of contacts might have left place-names for major territorial units – islands – for their successors of other linguistic stocks to use, yet no recognizable archaeological traces and, so far as is known, no record of other aspects of their language (e.g. a community writing or speaking it). If we accept that the suggested evidence for the use in the British Isles of a Semitic language is valid, it is logically possible that the islands were populated by speakers of a Semitic or Semitic-like language who were linguistically overwhelmed but some of whose toponyms were accepted by their conquerors or absorbers. This is the point at which the inconclusive wider arguments about a Hamito-Semitic substratum in Celtic could plug in, but whilst the argument for such influence has been widely touted it has not generally been thought convincing enough to become orthodoxy (*pace* Vennemann and his predecessors, and those who have believed that such an influence on Celtic may have been transmitted on to English). In any case, the possibility of PrSem influence on Celtic is logically distinct from that for the use of PrSem in the islands, because PrSem influence on Celtic could have taken place in Iberia, meaning that we would still lack an explanation of how PrSem place-names got into the British Isles except, perhaps too implausibly, by wholesale transfer (naming-after). An alternative scenario would allow PrSem adstratal influence on established Celtic populations, e.g. with Phoenician/Punic traders as the bearers. This possibility runs into the evident difficulty that a presumably transient population must have left its names for some of the major topographical features of the area and that these were taken up by the inhabitants and used in preference to their own names for them.[31] Sims-Williams (2011: 280, note 16) downplays any such difficulty, emphasizing that even if *Ériu* were of PrSem origin, that need not imply a settled presence of speakers of this language in Ireland. We could perhaps argue that these

exonyms were the ones transmitted to other cultures by the traders, and that they then filtered back into local native usage in waves from more prestigious later "Southern" cultures, a possibility which Broderick (2009: 167, points 5.-7.) suggests.[32] But what would serve very well as an analogy would be the discovery of names genuinely left on conspicuous geographical entities, especially coastal ones, by more or less transient populations, in a context where long-settled populations were the norm.[33]

The existence of such a name-set can be demonstrated, though the circumstances of its genesis do not match precisely what is known of the situation in prehistoric times. I know of no detailed study – in fact I do not believe it has ever been remarked on before – of the Scandinavian place-nomenclature which survives in the inner Bristol Channel and the Severn estuary, but this is a situation where the settled local population is universally believed to have spoken English and Welsh in their historic settings, and where there is no evidence in the local dialects for Scandinavian loanwords beyond those found generally in varieties of the two languages in England and Wales (PN Gl, Smith 1965, 4: 44). Smith either does not record, or does not comment specially on, any of the names discussed below: a body of names formulated in Scandinavian, a language spoken in the region only by people documented as raiders and traders, a few of whom may have become settlers no little distance away. These names are coastal, and in some cases denote local features where actual Scandinavian settlement is unthinkable, such as rocks in the sea. Let us list and discuss these names.

Firstly, we need to note the existence of three Scandinavian settlement names close to the inner Severn Sea (by which I mean further up-channel than Pembrokeshire where there is a cluster of such names indicating compact settlement). The first two are in historic Glamorgan and the third in historic Monmouthshire: *Homri*, in St Nicholas, in the Vale of Glamorgan north of Cardiff, *Womanby* in St John, Cardiff, and *Lamby*, at the mouth of the Rumney river and now in east Cardiff (Charles 1938: 158, 163 and 240-241).[34] These, with their Scandinavian specifiers combined with the characteristic element **bȳ-* 'farm, village', are genuinely in an extreme minority, and, not being adjacent to each other, it is doubtful whether they can be viewed as forming a cluster. But there is other very solid evidence of toponymic influence in the wider surrounding area, which needs some discussion.

The island of Flatholm, in St Mary's parish, Cardiff, Glamorgan, is sometimes said (e.g. Watts 2004: 232) to contain Scand. *floti* 'fleet' plus *holm* 'small island' (on the basis of the spellings *Flotholm* recorded in 1375, *the Floteholmes* 1387; Charles 1938: 163, though Charles took the view that it contains ON *flatr* 'flat; but NB the lexical expression *flota-hólmr* 'an isle' in Cleasby-Vigfusson). Watts links the name with the incidents reported in the *Anglo-Saxon chronicle* in, when a Viking fleet was starved out of the island (917, A version; the other versions say Steepholm). Flatholm is actually flat, by marked contrast with its English neighbour Steepholm. Whichever story we prefer, its name is of Scandinavian origin. The name of Steepholm has an

English first element and presumably dates from a period when *holm* was borrowed into English in a range of senses (Smith 1956: 258-9), therefore by itself offering no evidence for Scandinavian in the region.

There is a collection of shoals, reefs and banks in the Severn estuary which, despite the lateness of their first records, appear to have unmistakably Scandinavian names, that is, they contain elements which I have not found reported in regional English or Welsh lexis, but only in names. These include, far up the Severn and up to fifteen miles from the Cardiff area:

Gruggy (in mid-Severn in Redwick, not in PN Gl), cf. ON *grugg* 'mud; dregs', *gruggóttr* 'muddy': seemingly Scand. **Grugg-ey-* 'mud island'
Leary Rock (in mid-Severn in Aust, PN Gl 3: 129 (from 1830)), cf. ON *leirr*, another word for 'mud': seemingly Scand. **Leir-ey-* 'mud island'
The Scars, cf. ON *sker* 'rock, skerry' (in mid-Severn in Redwick, not in PN Gl)

We also find, rather more surprisingly, that some shoreline features have names formulated using Scandinavian elements. Perhaps the most striking is that recorded as *dumble*, *dunball* and the like in several places on the shoreline of the Severn upriver as far as Rodley (PN Gl 3: 205) and in the Taff estuary, where it names the outermost reach of tidally flooded land (i.e. not permanent saltmarsh; discussed fully in Coates 2007a, where it is interpreted as Scandinavian for 'mallard's abode or lair'). Another near-certainty is *Guscar Rocks* (Woolaston, not in PN Gl), in which the second element is beyond reasonable doubt *sker* (see *The Scars* above; 'goose rock', Scand. **gás*, assimilated to OE *gōs*?).[35] Charles (1938: 125-126) interprets *Mumbles* (Oystermouth, Glamorgan) as containing ON *múli* 'promontory' as its second element, and Coates (2007a: 64, image 72) sees Scand. **haug-* 'mound' or **havuð* 'head' in Howe Rock, off the end of Brean Down, Brean, Somerset. (The lost *Meles* in Margam (Glamorgan; Charles 1938: 137) is convincingly from Scand. **mel-* 'dune', but in an English or probably Norman French plural form, which therefore does not guarantee Scandinavian origin of the name.) Birnbeck Rock/Island, Weston-super-Mare, Somerset, has no known early spellings, but its name may be viewed as containing Scand. **bekk-* in the sense 'bench' attested in literary Old Norse but otherwise not identified in English place-names, whatever the first element might be; no other suggestion is in play. A pier was built linking the island to the mainland in 1867 (as originally proposed in 1845), and the original landform is not easily recoverable.[36]

A reviewer of this paper [WHOM I WOULD BE DELIGHTED TO ACKNOWLEDGE BY NAME IF S/HE CONSENTED TO BE REVEALED] has suggested that these Scandinavian names may have persisted into the Middle Ages and beyond through being reinforced by Bristol Channel traders based in originally-Scandinavian Dublin, and even into the age of rutters and coastal charts. I freely

accept this possibility, but the evidence for the continuity of the relevant names and vocabulary into the usage of any such traders, in dialect or on early maps, is lacking.

Most of the names in this group should be treated with caution because of their late attestation, but there seems to be a consistent pattern for which any other systematic explanation is at least equally difficult. Here we have evidence of a toponymic layer which has been taken up by a settled community from a visiting community involved in trade in the broadest sense, even if only piracy. The Scandinavians eventually must have put down roots which found toponymic expression in the three Glamorgan villages mentioned above, but the other names just listed do not form a natural hinterland or sphere of influence of those villages, and yet they seem to be names taken over as such from the visitors. The history of this process is one which remains to be written. In that sense, this name-set can be compared with the one which is central to this paper, although I acknowledge immediately that the sets are of a different order of prominence in the toponymic landscape of their respective periods. Nevertheless, the Scandinavian evidence shows that it is possible for economic visitors to give topographical place-names to a people speaking a different language, and for those place-names to stick without evidence of the visitors' language becoming part of the local ecology. From that perspective, then, the possibility of adstratal PrSem influence on Celtic-speaking communities in the British Isles in the later first millennium B.C.E. is one to be reckoned with, and should not be dismissed out of hand or from an entrenched viewpoint.

Recapitulation

It is best to set out finally, once again, the limits of what is proposed. The textual and philological evidence is restricted, and not always straightforward to interpret or uncontroversial. But what there is is compatible with the position that:

1. a small but not negligible number of the anciently recorded names of some of the larger islands of Ireland and Britain are of Proto-Northwest-Semitic origin, and that the suggestion that they are should not be dismissed out of hand;

2. it is defensible to interpret the existence of such names in the light of known and reasonably supposed incidents in the prehistory of the islands and of known analogies to their patterning.

NOTES

[1] John T. Koch has recently (2009) argued that Tartessian was in fact Celtic.

[2] Relevant texts by these writers are printed in Rivet and Smith (1979: respectively 87-92, 79-80, 82).

[3] Rivet and Smith (1979: 62-3).

[4] Vennemann appears to subscribe to the notion that modern linguistic evidence may disguise earlier evidence through wholesale folk-etymology (in one of two senses: Vennemann 1999b).

[5] More specifically, he believes that Germanic is "substratally Vasconized, superstratally Hamito-Semiticized Indo-European" (Vennemann 2000: abstract). The possibility of a Semitic substrate in Irish was first articulated systematically by Pokorny (1927), following Rhŷs (1890) and Morris Jones (1900); see also McCone (2005: 412-419). But their conclusions relate almost exclusively to grammar, and there is little suggestion of Semitic substrate lexis in their work, as McCone says forcefully elsewhere (2006: 40).

[6] However, I see this endeavour as entirely separate from current discussions about the possible influence of Semitic on Celtic and therefore on early English (Vennemann 2001, 2002; Filppula *et al.* 2008: *sparsim*, and further references there of which the fountainhead is Pokorny 1959: e.g. 161). I have nothing to say about this here, and the present paper should not be taken as indicating an attitude towards it (but see Coates 2010).

[7] I should make it perfectly clear that Vennemann has not uttered an opinion on the two names discussed in this section, and that his views on the elements mentioned are given here to provide a wider context for my remarks. He believes, moreover, that Vasconic influence on these or any other island-names is unlikely, since its speakers in his view "were no seafarers" (personal correspondence, 18/08/2008).

[8] A perhaps surprising recent addition to the list of Celtic island-names is *Yell* in Shetland (Coates 2007b).

[9] See Coates (1988b) for the full argument; the loss of final /m/ is an effect of Greek phonotactics. Sauren (2005: 280, n. 3) translates 'perfumes, spices'. Cf. also Krahmalkov (2000: *s.n.*). Note also the alternative Ptolemaic name of the group consisting of Ibiza and Formentera, *Pityussa*, taken to mean 'Pine Islands' after Greek *pitúa* 'pine'; and the argument of Rivet and Smith (1979: 452) that the unidentified garble *Saponis* in the *Ravenna cosmography* denotes fir or pine in a Celtic language.

[10] Bennett *et al.* (1990: 289), citing Wilkins (1984), have noted pine *(Pinus sylvestris)* from the archaeobotanic record of peat-bogs in South Uist, even though this tree is now extinct in the Western Isles.

[11] The caution with which this paragraph is formulated alerts to two difficulties: firstly, treading on ground which is not the writer's area of specialism; secondly, the quite significant differences of opinion on certain topics within the relatively small body of experts in this area, including the imputation of eccentricity to some particularly imposing works. There is also sometimes a disconcerting lack of congruity between apparently authoritative sources; for example the otherwise established "island"-word seems absent from anywhere in Orel and Stolbova/ Militarev and Stolbova's overarching Afro-Asiatic resource (1994-2007). No attempt has been made to harmonize differing transcription systems used by different Semiticists. I proceed with as much caution as I can muster, intending that the positions espoused reflect the most widely-held current opinions of Semiticists. I do not court the charge of eccentricity for its own sake.

[12] A general issue – and indeed risk factor – to be aware of is that the surviving Punic inscriptions would be broadly incomprehensible without some prior knowledge of Hebrew and Aramaic. Specifically, the Punic word for 'island' was recognized as such because the word is much more commonly attested in Biblical Hebrew. Some "knowledge" of Punic is therefore projected back from later states of Semitic, though that does not make it indefensible in itself.

[13] Coates (1988a) discussed this element in relation to a possible non-IE etymology for the waterway known as *The Solent* before opting for an IE solution.

[14] I owe to an anonymous colleague the observation that the final *-m* in *'yym* is a marker found specifically in Phoenician, Hebrew and Akkadian.

[15] The PrSem **paḫ(i)ḏ-* 'hip, thigh' reconstructed by Militarev (2006: entry 142) seems unlikely to be relevant here, and is in any case absent from the evidence for North-West Semitic.

[16] *Ramsey* (Pembrokeshire) seems to have an origin in a personal name, not *ram* (Charles 1938: 32; Owen and Morgan 2007: 406-407).

[17] One might compare the /b/ found in Latin *Britannia* and some Greek analogues with etymological /p/ in Welsh *Prydain*, but this would require the existence of */p/ in the source language which evidently therefore did not share phonological characteristics with Goidelic. I make no precise suggestion about what mechanism or route of transmission might have been involved in such a borrowing in either case, *Britannia* or *Ebudae*, or about whether it might be the same in both cases.

[18] Vennemann acknowledges (2006: 365-368) an unpublished suggestion by Peter Schrijver (in a personal communication to Vennemann, 2005) that a good case can be made for the <o> in the Ptolemaic spelling of the island-name (*Toliatis*, i.e. *Tonatis*) being taken at face value, since there is a later Brittonic and Gaulish sound change unrounding [o] before [a] as the later spellings require. This would make the spelling-record completely coherent, according to Schrijver. But there is an evident transmission error in Ptolemy's form, <ΛΙ> for <N>, and this necessarily weakens the credibility of the first vowel <o>, which is unique in the record. Having said that, though, I must also acknowledge that Schrijver's reasoning is correct if the <o> is not erroneous.

[19] I do not deal here with the vexed question of the relation between this name and a presumably related one with initial *Í-* (see for instance Isaac 2009; Broderick 2009: 153-154).

[20] For completeness' sake, I should draw attention to the Iberian anthroponymic and toponymic element *urke*, *orke-*, *urka* identified by Untermann (1998: 77, 81) as possibly comparable with the first element of *Orkney*, but this resemblance is the only one that can be derived from his list and its apparent presence could therefore be put down to chance resemblance.

[21] Schrijver (1997 and 2005) suggests some lexis of possible non-IE origin in European languages including Celtic, but concentrates on the phonological characteristics such a language may have had, rather than on the question of identifying one.

[22] This idea has been published recently independently by Vennemann (2006: 349-350 and notes), picking up earlier work by Henning (1925). Tempan (2008a; 2008b) has independently suggested the alien origin of Irish *ros*.

[23] The long vowels heard in the modern English place-names *Roos* (parish, Yorkshire East Riding) and *Roose* (Dalton-in-Furness, Lancashire) might be seen as offering difficulties. They seem to be late developments within English, because spellings implying a short vowel appear earlier in the record of both names (Smith 1937: 56; Ekwall 1922: 202). It is hard to imagine that the Yorkshire place could have been Brittonic-speaking late enough to show Brittonic lengthening of short stressed vowels (in the sixth century). Both places are close to, but not on, their respective counties' coast, and both could be considered as 'moor' names rather than as 'promontory' ones. Roos was a Domesday manor out of which several holdings have been carved, and it does not sound like typical moorland: "The parish comprises by measurement 2324 acres, of which two-thirds are arable and one-third pasture; the surface is undulated, and the soil a clayey loam, with gravel" (Lewis 1848, *s.n.*). Neither does it have any special prominences, though it is in Holderness, fairly close to Spurn Head, so it is possible, and attractive to suppose, that it preserves the pre-English name of, or a word for, the entire Holderness peninsula including Spurn, whose topography has no doubt changed profoundly in two millennia through coastal erosion on its east and cyclical tidal deposit and

scour on its south. On the other hand, in the far north of the parish there is an area called *The Furze*, which was common pasture, suggesting moor after all. Roose has no importance now except as a suburb of Barrow-in-Furness, but it was a Domesday manor. Ekwall (1922: 202) says: "The hill N.E. of Roose may well once have been a moor, i.e., a hill covered with furze and heather." As with Roos in Yorkshire, we may be dealing here with an original name for a whole peninsula, this time Furness. Whatever the case, it was apparently named by contrast with adjacent Leece, from Brittonic **lïs* 'court', though it was evidently later understood as "Leighs", which is Ekwall's interpretation of the name's origin (1922: 209). *Leece*, like *Roose*, has an etymologically expected long vowel, because anglicization of the area no doubt occurred later than the Brittonic lengthening, but that makes early spellings of *Roose* suggesting a short vowel problematic.

[24] The root is given as **rVyVm*- in Militarev (2007: entry 1179, evidenced in e.g. Ugaritic and Hebrew, though the Hebrew daughter has alternating /w/ for the second consonant).

[25] As cited from his suggestion (Stokes 1890: 000) in Watson's footnote mentioned in the text above.

[26] ~~On the corresponding Irish *torr*, see now also Tempan (2008b).~~

[27] Seemingly absent from Militarev (2006).

[28] In making the suggestions in this paper, I commit myself to no other aspect of any "Semitidic" hypothesis than those specifically mentioned. I am not a Semiticist, and have relied throughout on others' accounts of Semitic roots and their meanings, aware that, in some cases, scholars' reconstructions of the same root have differed and that they have been transcribed, and perhaps even vocalized, in different ways. I have not attempted to standardize their systems of representation; that is a matter for the specialists to reconcile (cf. note 11 above).

[29] Note the very interesting recent paper by Mac Eoin (2007) suggesting that *a* language substratal to Irish must have had intervocalic /f/. This suggestion is incompatible with that language's being PrSem at the stage of phonological development suggested by the evidence presented here.

[30] That is, nothing is concluded about whether PrSem might be substratal, superstratal or adstratal to the familiar languages of the islands. Further to my note 4, "Vennemann appears to subscribe to the notion that modern linguistic evidence may disguise earlier evidence through wholesale folk-etymology": if one starts with that perspective, one may doubt the acceptable Celtic solutions available for such names as *Eigg* from Ir. *eag* 'notch', *Hinba* (= ?Jura) from Ir. *inbe* 'incision' (Watson 1926: 85 and 82-83), and *Ériu* (Ireland) ultimately from PIE **piHwerjon*- 'fat (land)' (Schrijver 1995: 288 and predecessors). For the last of these, as noted under point 12. in the main text, Vennemann (1998b) has counter-proposed an

origin in PrSem **'y-wr'(m)* (? = **'iy-weri'um*) 'copper island', which might or might not suggest that he regards the modern form of the name as having been subjected to IE/Celtic folk-etymology.

[31] Broderick (2010) does not regard this possibility as problematic: "... it would be reasonable to expect that such prospectors and traders would have named the principal landmarks in their own language, and if they had settled in any numbers to exploit the mineral resources of Ireland and Britain, that their names for such prominent geographical features as bays, promontories, islands, mountains, etc, that served as landmarks might well survive to become incorporated within the later Celtic languages." But his scenario is equivocal between mere trading and settlement.

[32] We cannot do much with the logical possibility that any PrSem names represent Punic rationalizations of still more obscure native local names. The evidence presented should give us confidence that the vocabulary of the names in question and the words analysed have a sufficiently non-random similarity to PrSem etyma, across a data-set of restricted denotational range, to reduce this possibility.

[33] It is a moot point whether it is appropriate to compare the names left by imperial powers which have stuck to places as diverse as *Côte d'Ivoire*, *Islamabad*, *Port Moresby* and *Tripoli*, where the traders, religionists and settlers left their languages (French, Arabic, English, Greek) as a major, and demonstrably continuing, part of the local linguistic ecology. But *Indonesia* (Greek/Latin) and *Lagos* (Portuguese) might be useful, though not straightforward, comparators.

[34] The situation of Lamby (locally *The Lambies*), currently an open area at the mouth of the river Rumney/Rhymni, suggests that the second element might be Scand. **ey-* 'island', but the record of spellings assembled by Charles (1938: 240-241) makes it clear enough that we are dealing with a **bȳ-*, thus 'long farm', if this is the same place. *Homri* is 'Horni's farm' or 'horn farm' and *Womanby* is 'houndsman's farm', according to Charles (158, 163).

[35] The one restraining factor is the existence of the place, originally a farm, called *The Scarr* (recorded from 1779) in the inland parish of Newent (PN Gl 3: 179). However, this seems to be a recent name, because Rudge, in his epitome of Sir Robert Atkyns's county history, calls the property "*Waters*, or *Athelord's Place*, or the *Scar*" (Rudge 1803: 36).

[36] It is not inconceivable that *Birnbeck* is for Old Irish **berna bec(c)* 'little gap', perhaps metonymically for the narrow tidal channel separating Birnbeck from the end of Worlebury Hill, even though lenition of the adjective appears to be absent; but note that the one indisputably Irish name in Somerset, *Beckery*, a monastic establishment near Glastonbury, is from the syntactically different *Bec-Ériu* 'little Ireland' (Ekwall 1960: 33).

A Glimpse through a Dirty Window into an Unlit House: Names of Some North-West European Islands

Richard Coates
England

Abstract

It is well known that many of the major island-names of the archipelago consisting politically of Ireland, the United Kingdom and Crown dependencies are etymologically obscure. In this paper, I present and analyse a corpus of those which remain unexplained or uncertainly explained, for instance *Man* and *Ynys Môn*, *Ar(r)an, Uist, Seil, Islay*, *Mull*, *Scilly*, *Thanet*, *Sark*, among others. It is timely to do this, since in the disciplines of archaeology and genetics there is an emerging consensus that after the last Ice Age the islands were repopulated mainly by people from a refuge on the Iberian peninsula. This opinion is at least superficially compatible with Theo Vennemann's Semitic and Vasconic hypotheses, i.e., that languages (a) of the Afroasiatic family, and (b) ancestral to Basque, are important contributors to the lexical and onomastic stock of certain European languages. The unexplained or ill-explained island names form a sufficiently large set to make it worthwhile to hope for the emergence of some hard evidence bearing on their collective linguistic heritage, and therefore to give – or fail to give – preliminary support to Vennemann's hypotheses.

***

The Shakespearean scholar A.D. Nuttall once began a lecture at the University of Sussex about the difficulties he perceived in Darwin's theory of natural selection by saying: "This lecture is the rashest act yet committed in an admittedly rather unadventurous life."[1] *I feel rather the same way about what I have written here.*

It is commonly accepted that the final glacial advance of the last Ice Age (so far) in the British Isles was during the very cold event called the Younger Dryas (Oppenheimer 2006: 151–5). This happened at the end of the Würm interglacial, about 12,800–11,500 years before the present and therefore ending by approx. 9,500 B.C.E. The glaciers of the Loch Lomond Readvance covered much of southern Scotland and northern England and left the remainder of Britain under cold desert or tundra conditions. At this period, the region now occupied by the islands is believed to have been uninhabited.

Stephen Oppenheimer (2006) presents a synthesis of convincing genetic evidence that, after the Younger Dryas, Britain and Ireland were resettled by modern humans mainly emerging from the Ice Age refuge of the Iberian peninsula about 10,000 years ago. These people(s) had a Mesolithic material culture. Oppenheimer's view is consistent with the archaeological evidence cited by Barry Cunliffe (1997; 2001), which is interpreted as showing that a succession of material cultures, including those of the megalith-builders responsible for monuments such as Carnac, Newgrange, Callanish and Stonehenge, spread up from the south along the Atlantic coast to the British Isles. The route may have been maritime or terrestrial, and the alternatives available depend on the date. We know that the land-bridge joining Britain to the continent was not finally broken till about 6,500 B.C.E. Before that, people and their artefacts could have arrived by either land or sea, and after that only by sea.

Those who headed north as Europe warmed up must have spoken some language or languages. We have no historical knowledge of this period, of course. But we do have some archaeological knowledge of the languages spoken in the Iberian peninsula before the beginning of the Roman Empire (fully: Untermann 2001), and that knowledge will have to act as a proxy for an understanding of the local cultures of the first millennium B.C.E.

Some linguists group together certain poorly-evidenced and incompletely-understood Iberian languages as *Palaeohispanic*, a term intended to exclude the colonial and economic languages arriving late, namely Punic, Greek and Latin.

Palaeohispanic

Tartessian in south-western Iberia, ?7th–2nd centuries B.C.E.; linguistic affiliation unknown (Anderson 1988: ch. 5); uninterpreted texts; minimal detectable morphology (suffix *-ipon*).

Iberian in eastern and south-eastern Iberia, ?7th century B.C.E. – 2nd century C.E.; linguistic affiliation unknown, and a relationship with Basque no longer seriously entertained (many works of Tovar and Michelena; against Román del Cerro 1993); uninterpreted texts on stone, metal and coins, fairly rich anthroponymic, and some toponymic, records (Untermann 1998; Moncunill Martí 2007: esp. 55–6)

Lusitanian in inland western Iberia, ?6th century B.C.E. – year 0; an Indo-European language of uncertain relationship with Italic or Celtic (briefly García Alonso 2000: 31–2); 5 texts and some toponymic, anthroponymic and theonymic data.

Celtiberian or **Hispano-Celtic** in north-central Spain, 2nd–1st centuries B.C.E.; a branch of Continental (Q-)Celtic (survey by Eska and Evans 1993: 30–5); not fully interpreted texts; onomastic evidence; its existence is consistent with ancient Irish stories in *Lebor Gabála Érenn* 'Book of the Taking of Ireland' ("books" 2 and 8) about Gaelic migration from Iberia, the so-called "Milesian" invasion (on the relevant archaeology see Cunliffe 1997: ch. 7), though it is questionable what the linguistic effect of an invasion of male warriors would have been (as also observed by Mac Eoin 2007:117).

Aquitanian

A very close relative of reconstructed ancient **Basque**, with which it is practically identical; wider linguistic affiliation unknown (Trask 1997: 398–403). There is no clear justification for classifying this as a Palaeohispanic language. The strongest evidence for its existence in Roman times comes from north of the Pyrenees (Trask 35–42), and it cannot be ascertained how widespread it was before the year zero in the part of modern Spain where Basque has been spoken in historic times (but NB Michelena 1961–2; Trask 402–3). There is a considerable amount of anthroponymic and theonymic evidence for this language, offering lexical insights, but little else.

Colonial and economic languages

North-West Semitic (Phoenician, Punic) in some colonies of Carthage, e.g., Cartagena, Ibiza, Málaga and Cádiz, on the Mediterranean coast; inscriptions found even after the year zero.

Ancient Greek in some colonies on the Mediterranean coast, e.g., Ampurias, Hemeroskopeion (?Alicante) and Zakynthos (Zakantha; Sagunto).

Latin which eventually occupied almost the whole of Iberia.

There is little prospect of establishing the existence of any native non-Indo-European in the British Isles from historical sources. Most scholars accept that most of pre-Roman Britain and Ireland spoke some variety of Celtic (*pace* Oppenheimer 2006: ch. 7). It is still uncertain whether

all the evidence for Pictish indicates that it was a Celtic language or not (for a review, see Forsyth 1997). There are certainly non-Celtic or doubtfully Celtic place-names recorded from (esp.) northern Scotland (Nicolaisen 2001: ch. 9, esp. 244–5), but whether these might usefully be called Pictish or not is a controversial and unproductive matter. Ivernian or Ivernic, said to have been spoken in Ireland well into historic times and alluded to in Cormac's glossary (*Sanas Cormaic*; 9th/10th century; Meyer 1912; Russell 1988), is not fully recorded and it is only in evidence as a vocabulary source for a formal register of Old Irish. It may have been a P-Celtic language, and it cannot be concluded that it was non-Celtic. Some scholars of Irish have recently allowed the possibility of the existence of pre-Celtic languages contributing to toponymy without conceding explicitly that a particular non-Indo-European language might be involved (e.g., Mac Eoin 2007; De Bernardo Stempel 2007: 138; Tempan 2008b).

It has been known from the earliest times that speakers of the languages mentioned in bold type above, which I will collectively call "Southern", could possibly have penetrated for economic reasons as far as the British Isles. Latin would have been the last of the line. Greeks from Massilia visited the islands perhaps in the sixth century B.C.E. (an anonymous sailor, as reported by Avienus, though that has been challenged by Hawkes 1977: 17–25), and in the fourth century (Pytheas, as reported somewhat sceptically by Strabo, Pliny and Polybius).[2] Strabo says that the Phoenicians used British tin, but that does not necessarily mean that they ever came to Britain. However, in Elizabethan times, the schoolmaster and antiquarian John Twyne (1590) suggested that Phoenician/Punic tin-speculators had indeed reached Britain, bringing the coracle with them. Twyne's biographer calls this "a notion that beguiled much later generations" (Martin 2004), but it is not inherently implausible.

If there is any substance in the theory that the British Isles were resettled from Iberia after the Younger Dryas, then our knowledge of these languages represents the only hope of being able to offer any linguistic support to the settlement hypothesis arising from the joint venture of genetics, archaeology and Irish mythology. Looking for points of systematic resemblance between Insular Celtic and "Southern" would be well motivated in the light of these recent advances. We could look for "Southern" traces in the most problematic vocabulary of the Celtic languages, i.e., that which has been identified as uncertainly Indo-European (as others have done for a relation between Basque and Celtic; Trask 1997: esp. 368–72), and we could look for toponymic links between Iberia and the British Isles starting with the most obscure surviving toponyms in the islands. The latter task can be performed in two ways. We could look at the little available evidence of the "Southern" languages and see whether there is anything that illuminates the most problematic place-names. Or we could look at the most problematic place-names and see whether anything reminds us of the minimal "Southern" evidence. In practice, we could do these simple-minded tasks at the same time. But doing them is methodologically problematic: the evidence base at both ends of the task is so small and so semantically restricted that we are unlikely to discover anything systematic; and the danger of theorizing on the basis of individual snippets of data runs risks which are too well known to need emphasizing. We also need to bear in mind the probability of unknown linguistic changes in the relevant languages between the recording of texts and names at different times. Something is known about the history of Aquitanian/Basque (Michelena 1954 and subsequent work), Punic (Krahmalkov 2000, 2001) and of course Greek, and a fair amount about Continental Celtic (Eska and Evans 1993; Sims-Williams 2006); nothing is known of the evolution of the other languages. We need to bear in mind the risk of the obliteration of some sorts of evidence, for example phonological, when a name is adopted and adapted by speakers of another language. The additional risk of completely normal so-called folk-etymological pressure is constantly present.[3]

We could conclude straight away that we are looking for needles in a haystack even though we are unsure exactly what needles look like and suspect that the haystack contains a few things

which look a bit like what needles might look like. It would be foolish to expect anything more than some hints and possibilities to emerge from the present paper, and I do not want to raise expectations. We will be playing with similarities in the interpretation of which we risk an excessively naïve approach to the little data we have. But it is a task worth doing. If another discipline produces a serious hypothesis with linguistic implications, then linguists are right to see what light they can shed on the problem. And our own discipline, independently of the genetic findings, has come up with a serious proposal: Theo Vennemann has proposed in a long series of articles that the vocabulary of northern European languages has both a Semitic-like (Semitidic) and a Basque-like (Vasconic) strand.[4] Vennemann's hypothesis (as set out for example in his 1998a paper) is at least superficially compatible with aspects of the story told by genetics, archaeology and Celtic mythology. It is against the background of this *prima facie* possibility that I want to explore possible Insular-"Southern" relations.

The rest of this paper presents selected evidence from one category of names in Britain and Ireland – island-names – that has proved resistant to analysis or controversial. No other single group of names offers so much dark material, though I shall mention other names from time to time, and strike off in a new but related direction at the end. A complete onomastic analysis would deal also with river-names and personal names in the early Irish and Romano-British (RB) record, and we ought also to consider historically unexplained lexical items in Celtic: but let's start with island-names as a well-defined category.

The Island Mysteries

There are two small sets of difficult island-names sharing similarities, and these are of particular interest in a study where too much may easily be read into a single name. Here, the default strategy of previous investigators has been to attempt an explanation in terms of known elements in known languages, and that is of course perfectly reasonable: it respects the evidence as we have it. It does not always produce a credible solution, but sometimes it does.

1. *Mann* (Man) and *Môn* (Anglesey)

We need to examine these names in the present context because of Vennemann's (e.g., 1993: 460–8; 1995) attention to a supposed Vasconic root seen in Basque *mu(i)no* 'hill' and *muna* 'slope, bank' appearing in many European place-names. These words are, however, likely to be Romance borrowings in Basque (Trask 1997: 367, following Corominas and Pascual 1980, who propose a Romance stem **bunn*-), and if that is the case Vennemann's suggestion that these words may appear in Vasconic place-names in Europe is compromised.[5]

Mann and *Môn* have often been confused, partly for phonological and orthographic reasons and partly because the islands share the Irish Sea with each other. Despite massive orthographic variation in the sources, philology demands that *Mann* be referred to a British **Manaw(j)ā* (see Rivet and Smith 1979: 410 for a summary of discussion up to that date). Such a form may also be responsible for the name *Manaw Gododdin (Manau Guotodin)*, an early-recorded district at the head of the Firth of Forth, and for Irish names of the type *Mano* (Loth 1934). There seems no reason to give credit to Pliny's spelling *Monapia*, which might have induced us to look at the Tartessian suffix including *-p-*, of unknown meaning. Rivet and Smith refer **Manaw(j)ā* to a root meaning 'high'. It might be cognate with the root of British **monijo*- 'upland' which may also be seen in *Mona*, *Môn*; De Bernardo Stempel (2007: 158) actually suggests that the name of Man means 'the one related to Mona'. The relation might be underpinned by the well-evidenced change of [o] to [a] before a resonant consonant when followed by another [a] (Schrijver 1995: 94–7), and if that is right then the name is Celtic, specifically Brittonic. Rivet and Smith cite continental analogues. Broderick (2006: xi) offers a more cautious "Indo-European" suggestion involving the root **men*- 'rise', and Hamp (2003) suggests more specifically for Anglesey **mon-ā*

'the high one'. These three ideas are compatible (though in part curious, since Anglesey is not literally high; perhaps Holyhead Mountain/Mynydd Tŵr on adjacent Holy Island was meant).

> Verdict: *Mann* and *Môn* are probably Celtic, and almost certainly Indo-European. *Môn* may be British of an archaic suffixless morphological type. No relevant root is known in the Palaeohispanic languages. Indeed neither Iberian nor Aquitanian/Proto-Basque has root-initial /m/, and their prehistoric forms would therefore be incapable of transmitting lexemes beginning with /m/ to other languages.

2. *Eilean Arainn* (Isle of Arran) in historic Buteshire, Scotland, an old dative form where the *-n* is part of the inflectional suffix;
Oileáin Árann (Aran Islands) in Co. Galway, Ireland; base name of the largest island: *Árainn;*
Árainn Mhór officially, earlier simply *Árainn* (Arranmore) in Co. Donegal, Ireland.
In forthcoming work, Paul Tempan identifies other possible instances.

It is very tempting to associate these three island-names with each other, despite the short vowel in the first syllable of the Scottish name as opposed to the long vowel in the two Irish ones. Flanagan and Flanagan (1994: 17) suggest, in a rather careful wording, that the two Irish names embody Irish *árainn* 'ridge'. Watson (1926: 87) suggests Irish *áru* 'kidney' for Arranmore in Donegal, citing its shape. The eye of faith could no doubt see reason for both suggestions, but neither 'kidney' nor 'ridge' is really convincing for the Donegal name, and a view from a very high-flying bird's eye is needed before the island in Bute appears kidney-like. Watson adduces some Welsh names with a historic short vowel, of which one is that of a river, one is applied to two adjacent hills, and one with a diminutive suffix is again a pair of adjacent hills. Owen and Morgan (2007: 17–18) are confident that the hill-names can be derived from a diminutive form *aran* 'little ridge' with an original long vowel in the first syllable (like others mentioned by Thomas 1938: 180); *Arenig* would contain therefore a double diminutive. The variety of application is troublesome, as is the phonological disparity. 'Ridge' is arguably suitable for Aran and the hill-names in Wales, but a generalized 'elevation' word would suit all except Arranmore, which is not exceptionally high, to judge from the photographic evidence I have seen on the Web. An etymological long vowel is compatible with the known forms of all except Arran.

> Verdict: no single solution seems possible. Vennemann has suggested that a phonologically suitable word, the ancestor of Basque *aran* 'valley', is found throughout north and west Europe – and in at least one English place-name (*Arundel*; 1999a: 30–3), but this can be shown with near-certainty to be wrong (Coates 2000: 5–6). It is semantically out of the question that it should figure in any of these island-names, and Vennemann has not suggested that it does.

We are now reduced to examining singletons, individual island-names which might hold out some promise of revealing their origins through a "Southern" magnifying-glass. What might give us confidence that this is worth doing?

3. *Uist*

In an obscure little paper in which Vennemann has taken a gratifying interest (Coates 1988b), I suggested an etymological link between *Ibiza* in the Balearic Islands (Catalan *Eivissa*; *Ebusos* in Manilius and Pliny and *Ebousos* in Didorus Siculus) and the two Hebridean islands called *Uist* (Scottish Gaelic *Uibhist*, /iβiʃt/). I followed Hübner in the first edition of *Pauly-Wissowas Real-Encyklopädie* (1905) in proposing that *Ibiza* represented a Semitic name possibly meaning 'island of some fragrant plant, e.g., balsam or pine' (cf. Proto-Semitic [PrSem] **bśm* 'balsam'),[6] and suggested that *Uist* had the same origin (not ruling out transfer), gaining its modern final /t/ under analogical influence from Old Norse *ívist* 'inner dwelling', this form being on record *(Iuist)* as the

Scandinavian name of the islands.[7] Armed with this hint (to put it no more strongly than that), we might look closely at some of the remaining obscure names.

I shall use the term *Proto-Semitic* below as a way of characterizing lexical roots without suggesting that the names discussed must go back to the date when Proto-Semitic was a spoken language, and without precise implications of period, dialect, or vocalization of the roots cited unless more detail is given; that is, the term should be taken to include the daughter language Proto-North-West-Semitic [NWSem] and to be non-dogmatic about morphology.

4. *Iona*

Iona (more correctly *Ioua*; Old Irish *Í*, sometimes spelt with a decorative initial <h>) is of unknown origin. It can scarcely mean 'yew' as Watson (1926: 89) suggests, unless the name was given commemoratively. There is no evidence on this well-excavated island for yew at any period, and it has always been notoriously barren. Herbert Sauren (2005) documents an epigraphically well attested Punic word, the most usual variant of whose base-form he analyses as *'y*, meaning 'island, isolated place'. Sauren notes that the word appears in royal correspondence from Byblos as *yw* (2005: 279–80; morphology unclear to me), which brings us somewhat closer to the name of Iona as known to history.

Although there is little indeed to go on phonetically, it is not beyond possibility that this root is what is represented in *Ioua*. If the form *Ioua* contains more than *Í* does, rather than simply a now-silenced root-integral /w/, then perhaps it is a lost second element. Vennemann has suggested several other island-name etymologies with the structure PrSem **'y XXX*, i.e., with a generic-first structure.

5. *Seil*

An island called *Sóil* is recorded in the Book of Leinster (Watson 1926: 41). This is generally acknowledged to be the one called in modern Gaelic *Saoil* (English *Seil*). No etymology has been proposed, but it seems worth comparing Arabic *sāḥil* 'coast', PrSem root **šḥl*. This is not as fanciful as it might sound; Seil is the closest of all the Inner Hebrides to the mainland, and is linked to it by Clachan Bridge (built in 1792–3), which the local tourist office claimed for many years to be the only bridge in the world over the Atlantic Ocean (as illustrated below).

Clachan Bridge *The Atlantic Ocean from Clachan Bridge*

Source: en.wikipedia.org/wiki/Clachan_Bridge

6. *Islay*

Islay is of doubtful Celticity (Watson 1926: 86–7, offering some problematic comparisons). It appears as *Ile* or *Ila* in ancient Irish literature, as *Ilea insula* in Latin, and in modern Gaelic it is *Eilean Ìleach*. Here, too, there is little to go on. One might consider the unexplained name of the ancient town of *Ilipa* near Seville in Tartessian territory, suggesting that the *-ip-* in this might

represent the only securely identified suffix in that language. But given the notable European propensity for regarding islands in the west as sacred, noting that Islay is the westmost in its sector of the Inner Hebrides, and following the hint of Semitic involvement, perhaps we should not rule out a connection with PrSem **ħll* 'pure, holy', or better even with the root of the divine word or name seen in Phoenician *'l*, with the second syllable in the modern name attributable to an extended form of the root comparable to those seen in Hebrew *'Eloah*, Biblical Aramaic *'Ĕlāhā* and Arabic *Allāh* (< **al-'ilāh*). Maybe here too we have survival of the generic **'y* in initial position: 'island of the god.'

7. *Mull*

Mull is probably recorded in the Ravenna Cosmography as *Malaia*, and in Ptolemy as *Maleos*. Watson (1926: 38) gives a convincing phonological account of the development of the modern form in Gaelic, *Muile*, and thus English *Mull*, from some such form. He offers a Celtic etymology from a root meaning 'praise', and speculates on an application of this root in the sense 'lofty'. De Bernardo Stempel (2007: 153) suggests the meaning is 'the evil one', which is formally acceptable, but she offers no motivation. If these suggestions are considered semantically somewhat contrived, it might be worth reserving a glance for the PrSem **mlħ* 'salt': cf. Hebrew *mallûaħ,* a salt-marsh plant (?marsh mallow). Whilst Mull is not archaeologically known for sea-salt production, it certainly has saltmarsh (Gillham 1957), which is the prerequisite for the industry. Several such sites on Mull are mapped by Burd (1989), though none is a large one, and the presence of small areas of saltmarsh in the Western Isles is not unusual.

8. *Scilly*

It has been suggested by Vennemann (1999a: 40–2) that *Scilly*, a name with a very diverse and inconclusive record of spellings, might be compared with a PrSem root "**s-l-*" meaning 'rock, cliff', as seen in Hebrew *sela'*.[8] With mean sea level as it is at present, Scilly has plenty of rocks, but not much significant cliff except on the island of Tresco. Some time ago, when considering the name of The Solent (1988a), I evaluated some of the same evidence without finally coming to this conclusion.

9. *Hebrides*

In the same article (1999a: 46), Vennemann also suggests a PrSem origin for the ancient name of (some of) the Hebrides *(Ebudae)*, involving the plural of the generic **'y* we have seen previously (**'yym*) and a specifier related to one of two PrSem roots of the form **pħd*, namely 'lamb' and 'fear'. He avoids the difficulty of the general loss of prehistoric */p/ in the borrowing Celtic languages by proposing that */m-p/ is rendered by Ancient Greek *β*, and that a reflex of this is what surfaces in the attested forms. Perhaps this relies too heavily on the analogy of Modern Greek spelling conventions, and for me it undermines the proposal; we should be looking instead for an explanation internal to PrSem. But I leave it on the table because of the evident semantic and toponomastic attractiveness of the 'lamb' possibility seen in the light of the various Scandinavian 'sheep islands' of the north and west, such as the Faroes, more than one Soay, and Lambay, the Eilean nan Caorach in Durness, Sutherland, and the English Sheppey in Kent. De Bernardo Stempel (2007: 155) suggests instead that the name is a modification of *Epidion*, an island-name in Ptolemy, but like Vennemann has to resort to the unmotivated phonetic development [p] > [b] to account for it.

10. *Thanet*

Vennemann (2006) explores the possibility of a PrSem origin for *Thanet*. I myself mentioned that such a possibility had been suggested in the past, but did not pursue it, in a paper whose main

topic was the alternative recorded name *Ruoihin* or the like (2000: 32–9); Vennemann's more sophisticated work on this persuades me that I may have missed an opportunity. He concludes, arraying a great deal of evidence which I have no space to repeat here, that the name enshrines that of the Phoenician goddess Tanit.

11. *Sark*

In Coates (1991: 73–6), I regarded the ultimate source of *Sark* as unknown; its early attestations suggest a root **Sarg-*. One might compare PrSem **śrq* 'redden; rise (as of the sun); east' (cf. Arabic *šarq* 'east'). Sark is of course the easternmost, and outermost, island of the Guernsey geological group.

12. *Echri*

This Welsh name of Flat Holm in the Severn estuary is unexplained, except as a possible variant of "Echnus", maybe to be equated with Éogan (Owen and Morgan 2007: 153), an Irish saint having no known connection with the place. On the other hand, PrSem **'ħr* 'behind, back' is suggestive: Flat Holm is the last usable island heading up the Severn, i.e., one reaches it after Lundy, Stert Island, Sully Island and Steep Holm. Denny, which comes after, is an uninhabitable rock.

I must remind readers that, for me, these observations taken together do not amount to a proposal with worked-out consequences. They are suggestive juxtapositions of some ancient and modern island-names with some ancient roots. In almost all cases so far, the morphology of the suggested original name is not fully elucidated. There are some sparse hints of contact effects in the phonology (of an unsurprising kind), viz. the non-transfer (elision) of **ħ* (except perhaps before [r]; see 12.), the elimination of **p* in line with the known development of Celtic, and the substitution of /s/ for **š* and **ś*. But a direction is emerging: with whatever diffidence these suggestions are put forward, Proto-Semitic at least provides something to consider in relation to insular toponymy, and I shall suggest below some further evidence that points in the same direction.

Other similarities between British island-names and Continental evidence

13. *Wight*

We might re-examine *Wight* (RB *Vectis*), which has generally been given a not entirely convincing Celtic derivation, cf. Middle Welsh [MW] *gweith* 'turn, occasion, course, [etc.]'. Rivet and Smith (1979: 488–9) cite Förster's quotation of a thirteenth-century interpretation of Nennius associating the island-name with a MW term *"Gueid vel Guith"*, which is equated with Latin *divorcium*, in the sense 'fork in a road', possibly meaning the island where the Solent splits at the end of Southampton Water, or the island which generates double tides in the Solent by splitting the surge of the Atlantic waters at its western end. Both of these ideas offer difficulties about how these phenomena might have been perceived and toponymically encoded. But note also that *Vectis* might usefully be compared with the name of the *insulae Vacetae* (Collins 1988), a generic name in the Ravenna Cosmography for the islands of Oléron and Ré in the French sector of the Bay of Biscay. If a form ancestral to the latinized *Vacetae* was stressed on the first syllable (which we can't tell, but cf. *Namnetes* > *Nantes*), it could, via a syncopated form */wakt-/, give *Vect(is)*, though the RB stressed vowel is then in need of explanation.[9] No etymology can be given for *Vacetae*, but it cannot have been Aquitanian/Basque for phonological reasons; and even though the continuator of Fredegar's Chronicle equates the eponymous tribe called the *Vaceti* with the Basques,[10] there is no philological connection between the names. We are left with the

possibility of a Southern connection for *Wight*, but cannot even associate it with a particular language.

14. *Bass Rock*

In the light provided by this direction, we might re-examine *Bass* Rock (East Lothian, Scotland), whose earliest recorded form seems to be universally *Bas*,[11] and compare the equally unexplained name of the island of *Batz*, close to Roscoff (Brittany, France), recorded early as *Battha*, *Baz* and now *Baz* in Modern Breton *(Enez Vaz)*.[12] The difference between the final consonants may offer some difficulty, but an early **Bats* could have undergone cluster simplification in any variety of Insular Celtic.

15. *Coll*

The island of Coll in the Inner Hebrides is recorded twice as *Colosus* in Adamnán's *Life of Columba* (Watson 1926: 84–5). Any form with an intervocalic /s/ is a problem to explain in Celtic, and Watson accordingly suggests it might be pre-Celtic. Accepting the dangers of identifying this form naïvely with Greek *kolossós* (of uncertain origin, not originally Greek; see most recently Lindner 2003: 107), we should by no means find it incredible that there could have been a large standing stone of humanoid shape here, as on other Hebridean islands such as North Uist and Lewis. There are at present two smallish stones, the Totronald Stones (personified in Gaelic as *Na Sgeulaichean*, 'The Storytellers'), 5' and 6' tall. These underline an earlier possibility even though they are themselves not exactly convincing as human figures (RCAHMS).

One of *Na Sgeulaichean.*
© Tony Oliver, Coll Digital, reproduced with permission

The name could have been given at a time when *kolossói* were a well-known feature of Hellenic and therefore Mediterranean culture, or by speakers of a language in which the ancestor of the word was a native term. This suggestion leaves the island-name without a generic, but there is no shortage of other islands in the Western Isles whose current names have no apparent (surviving reflex of a) generic term: Seil, Islay, Rum, Eigg and Mull, for example.

Coll is generally explained as deriving from Gaelic *coll* 'hazel'. It is true that hazel is a component of the native flora of certain islands in the Inner Hebrides (Gilbert 1984; Coppins, Coppins, and Quelch 2002), but the modern word does not in itself fully explain the form of the name in Adamnán's *Life of Columba*.

Conclusions negative and positive?

This is only a short paper, and it is already time to take stock. My first conclusion is probably unsurprising: there is no definite evidence for any Palaeohispanic impact on island nomenclature, except to the extent that the presence of Q-Celtic Gaelic may itself represent a strand of such evidence. Perhaps there could not be any in the present limited state of our knowledge. My second conclusion is that the same island nomenclature offers no support at all for Vennemann's Vasconic hypothesis, but Vennemann himself would not expect his Vasconic herdsmen to be involved in the naming of island habitats (personal correspondence, 18/08/2008).[13]

There is, however, some further tantalizing evidence beyond what I have presented here which suggests that Vennemann's other hypothesis of a Semitic connection should not be dismissed out of hand, and which tends to make the suggestions above less incredible. Beyond the small fistful of singleton island-names just presented (Uist, Iona, Seil, Islay, Mull, Sark, and perhaps Scilly, *Ebudae* and Thanet), there are further hints of contact with Semitic, this time in the common topographical vocabulary of Celtic and other place-names of the Celtic-speaking lands.

The Proto-Celtic **ros*- is semantically problematic, having the meanings 'promontory' and 'moor' (Padel 1985: 199–203). Within Indo-European, a single possible Indic comparandum has been suggested (Sanskrit *prasthas* 'plateau', = literally 'that which stands forth'). But perhaps in the first of these senses, which seems to be the earlier (esp. in Irish and Cornish), it could be compared with PrSem **ra'š* 'headland, promontory', in the specifically NWSem form with a backed and raised vowel (Phoenician **rōš* 'head, headland').[14]

Another height-word in Semitic is **rām* as in the modern place-names *Ramat Gan*, Israel, and *Ramallah*, Palestine (PrSem root **rwm*). I have elsewhere argued cautiously that this might be seen in the Cornish place-name *Rame* which may allude to the conspicuous conically-shaped hill on a headland in this parish guarding the entrance to Plymouth Sound, and whose modern pronunciation can be explained in terms of local English dialect conditions (Coates 2006: 7–8). The same root might be seen in a vocalically different form in the name of the island of *R(h)um* (recorded ostensibly in 677 as *Ruim*), whose name is not satisfactorily explained. Mac an Tàilleir (2003) is willing to call it "pre-Gaelic" in defiance of a *prima facie* case for Gaelic *rùim* 'space' and of an earlier Indo-European proposal by Stokes, quoted by Watson (1926: 95, n.3). Rum happens to have the highest mountains anywhere in the Western Isles except the Cuillins group on Skye, including therefore the highest non-Cuillin peak (Askival, 2664', 812m).[15]

There is a problem with Cornish *tor* 'belly', which seems to appear in place-names referring to hills, like its Welsh counterpart *tor* and Irish *torr*. There is an (originally dialectal) English word *tor* applied to rocky outcrops or crags, and this is widely believed to come from the Cornish word (as mentioned by Padel 1985: 221–2). The semantic aspect of this idea is problematic, and it is open for us to wonder whether the English word is really an application of PrSem **ṭur* 'rock', as seen in the name of the city of Tyre, Lebanon, on its offshore rock. Padel notes the difficulty that *tor* does not appear in Cornish with the sense of 'tor, crag', which creates a problem in any

theory of the transmission of the term to English. But formally, there is no problem: **tor*, a feminine noun, could be for "British" **turā*, a formally celticized version of **ṭur*. [16]

The much-discussed but still unexplained OW *cair* 'fort; (later) village', Cornish *ker* 'univallate curvilinear hillslope enclosure; village', Breton *kêr* 'village' (Padel 1985: 51), can be compared with the PrSem root **kpr* 'village' (cf. Ancient Hebrew *kāpār* (bound form *kəpar*), Modern Hebrew *kfar*, Arabic *kafr*), with pan-Celtic loss of /p/.

The suggestions in this part of the paper too are advanced with all due caution. The possibility of coincidental resemblances cannot be dismissed, but for me, there are too many to do that casually. No cultural context is given except the general probability of the settlement of the British Isles from the south, and the possibility that one linguistic strand might be represented by North-West Semitic with no detailed regard for the reasons that might have taken it there.[17] There may be (but need not be) inconsistencies in the implied phonological development of the items discussed here (as implicitly in *Rame* and *Rum*), and I have only touched on the question of how PrSem consonant phonemes might have been represented in Celtic. There is hardly anything that can said on the basis of this evidence about vowels, or about morphology, that of Semitic being of course typologically quite different from that of Indo-European. All that remains is the possibility of glimpsing through a glass darkly the lexis of a language used in the British Isles in periods of settlement more remote than we can see through the lens of the known languages of the area.[18, 19]

Notes

* I am grateful for magnanimous comment on this paper by Theo Vennemann given in the face of nearly twenty years of scepticism on my part about his larger theses. I am also grateful to Paul Tempan for sight of two pre-publication articles of his, on the discovery that we are working with similar ideas; and also to Tony Oliver for permission to use his image of a Totronald Stone. This paper covers some of the ground of my unpublished paper, "On a recent view of the linguistic prehistory of Europe", read to the Linguistics Association of Great Britain conference, University of Sussex, Brighton, April 1996.

1. Quoted by Laurence Lerner in his obituary of Professor Nuttall, *The Independent*, 8 February 2007.

2. Relevant texts by these writers are printed in Rivet and Smith (1979).

3. Vennemann appears to subscribe to the notion that modern linguistic evidence may disguise earlier evidence through wholesale folk-etymology (in one of two senses: Vennemann 1999b).

4. More specifically, he believes that Germanic is "substratally Vasconized, superstratally Hamito-Semiticized Indo-European" (Vennemann 2000: abstract). The possibility of a Semitic substrate in Irish was first articulated systematically by Pokorny (1927).

5. I should make it perfectly clear that Vennemann has not uttered an opinion on the two names in this section, and that his views on the elements mentioned are given here to provide a wider context for my remarks. He believes, moreover, that Vasconic influence on these or any other island-names is unlikely, since its speakers "were no seafarers" (personal correspondence, 18/08/2008).

6. See Coates (1988b) for the full argument; the loss of final /m/ is an effect of Greek phonotactics. Note also the alternative Ptolemaic name of the group consisting of Ibiza and Formentera, *Pityussa*, taken to mean 'Pine Islands' after Greek *pitúa* 'pine'; and the argument of Rivet and Smith (1979: 452) that the unidentified garble *Saponis* in the *Ravenna cosmography* refers to fir or pine in a Celtic language.

7. Bennett *et al.* (1990: 289), citing Wilkins (1984), have noted pine *(Pinus sylvestris)* from the archaeo-botanic record of peat-bogs in South Uist, even though this tree is now extinct in the Western Isles.

8. I discussed this element in relation to an etymology for the waterway known as *The Solent* before opting for an Indo-European solution (Coates 1988a).

9. It may be significant that the other front vowel in the Gaulish phonological system, [e], may be raised to [i] after [w] (Lambert 1997: 41); an analogous effect on the lower vowel [a] could account for *Vectis*, assuming that Gaulish and British shared some phonological characteristics.

10. «… cum exercito magno et plurima Wasconorum qui ultra Garonnam commorantur, quem antiquitus vocati sunt Vaceti.» Quoted by Collins (1988: 214).

11. E.g., Wyntown's *Cronykil*, 1404, 1426; Hector Boece 1526.

12. Forms recovered, with others, from http://www.infobretagne.com/ile-de-batz.htm (accessed March 2008).

13. For completeness' sake, I should draw attention to the Iberian anthroponymic and toponymic element *urke*, *orke-*, *urka* identified by Untermann (1998: 77, 81) as a possible comparandum for the first element of *Orkney*, but this resemblance is the only one that can be derived from his list and should therefore be put down to chance.

14. This idea has been published recently independently by Vennemann (2006: 349–50 and notes), picking up earlier work by R. Henning. Tempan (2008a; 2008b) has independently suggested the alien origin of Irish *ros*.

15. The fact that the names *Rame* and *Rum* end in /m/ poses a problem for Celtic derivation. Since intervocalic lenition of */m/ would be expected, my account suggests implicitly that these exotic names were indeclinable and suffixless in Common Celtic, in much the same way that one finds *Les Écrehou* for certain cluster of rocks in the Channel Islands, whose name is of foreign (in this case Scandinavian) origin. Otherwise, the source of the /m/ must be found in a geminate or a bilabial cluster, which are inconsistent with the present suggestion.

16. On the corresponding Irish *torr*, see now also Tempan (2008b).

17. That is, nothing is concluded about whether PrSem might be substratal, superstratal or adstratal to the familiar languages of the islands. Further to my note 3, "Vennemann appears to subscribe to the notion that modern linguistic evidence may disguise earlier evidence through wholesale folk-etymology": if one starts with that perspective, one may doubt the acceptable Celtic solutions available for such names as *Eigg* from Ir. *eag* 'notch', *Hinba* (?Jura) from Ir. *inbe* 'incision' (Watson 1926: 85 and 82–3), and *Ériu* (Ireland) ultimately from PIE **piHwerjon-* 'fat (land)' (Schrijver 1995: 288). For the last of these, Vennemann (1998b) has counter-proposed an origin in PrSem **'y-wr'(m)* (? = **'iy-weri'um*) 'copper island', which might or might not suggest that he regards the modern form of the name as having been subjected to IE/Celtic folk-etymology.

18. In making the suggestions in this paper, I commit myself to no other aspect of any Semitidic hypothesis than those specifically mentioned. I am not a Semiticist, and have relied throughout on others' accounts of Semitic roots and their meanings, aware that, in some cases, reconstructions of the same root have differed and that they have been transcribed and vocalized in different ways.

19. Note the very interesting recent paper by Mac Eoin (2007) suggesting that *a* language substratal to Irish must have had intervocalic /f/. This suggestion is incompatible with that language's being PrSem at the stage of phonological development suggested by the evidence presented here.

THE ORIGINS OF THE *COMMENDA* CONTRACT

By JOHN H. PRYOR

ULTIMATELY the origins of the medieval *commenda* contract are unknowable simply because the contract was the product of an amalgamation of many different traditions. That which follows does not pretend to offer conclusive evidence for the derivation of the *commenda* from any other single contract. Rather, its intent is to show that the *commenda* embodied borrowings from several sources in different proportions and that this was entirely natural since the peculiar features of the *commenda* were developed by the commercial community itself during the early Middle Ages. Indeed, the *commenda* would be expected to have embodied borrowings from elsewhere since the commercial community was surely the most pragmatic and eclectic of all segments of medieval society. Yet even if the *commenda* comprised an amalgam of borrowings from several different sources, the extent of borrowing from each of the various sources differed. It is a reinterpretation of the strength of the various influences and a suggestion for a revised synthesis which is offered here.

In the course of the last decade, Professor Udovitch has argued forcefully and repeatedly that the source most likely to have contributed to the peculiar characteristics of the *commenda* was the Muslim *qirād* contract. He has argued this thesis in three successive works: "At the Origins of the Western Commenda: Islam, Israel, Byzantium?" SPECULUM 37 (1962), 198–207; *Partnership and Profit in Early Medieval Islamic Trade* (Princeton, 1970), p. 172; and "Commercial Techniques in Early Medieval Islamic Trade," in D. S. Richards, ed., *Islam and the Trade of Asia: A Colloquium,* Papers on Islamic History 2 (Oxford/Philadelphia, 1970), p. 48. However, in spite of the forcefulness of his arguments and the indisputably close similarity of the *qirād* to the *commenda,* historians of medieval economic history remained skeptical. For example, on page 76 of his attractive little book *The Commercial Revolution of the Middle Ages, 950–1350,*[1] Professor Lopez left the question open. He simply said that Islam and Byzantium seem to have the best claims as possible sources for the *commenda.* By this he alluded to the Byzantine *chreokoinōnia* contract as well as to the *qirād.* In fact, the influences on the development of the *commenda* were even more complex than this. Both the Jewish *'isqa* contract and the Roman *societas* have good claims to be important sources of the principles and characteristics of the *commenda.* The possible influence of these last two contracts on the *commenda* has been underestimated by most historians.

A contract in which one party invested his labor and the other invested his capital was an eminently practical means of financing commerce. Consequently, it is not in the least surprising that contracts similar to the *commenda* should have been used previously by other civilizations. The Babylonian

[1] Englewood Cliffs, 1971.

tapputim, the Athenian maritime loan ἑτερόπλουν, and the Roman sea loan (*nauticum fenus*) might be added to those already mentioned. However, only the *nauticum fenus*, the *societas*, the *'isqa*, the *chreokoinōnia*, and the *qirād* seem close enough to the *commenda* in time and geography to have had any direct influence upon it. Even then, whether these contracts did influence the development of the *commenda* and of each other cannot be determined with certainty simply because a contract like the *commenda* was such a practical means of financing commercial activity. They may all have been individual responses to similar economic needs in different places at different times. There is no direct evidence of influence on the *commenda* by any of these contracts except the *chreokoinōnia*. Therefore, in considering the relative importance of the various influences on the *commenda*, all that can be attempted is to point out certain similarities and differences and to assess which contract was the most similar to the *commenda* and therefore most likely to have influenced its development.

In what follows there is no attempt to describe in detail the structure of the *commenda* contract. At the present time, even the best works on the *commenda*, those of Astuti and Scialoja,[2] are greatly deficient in their analysis of the way in which the *commenda* fitted into the pattern of commerce in the Mediterranean and of the basic economic function of the contract: the ways in which individual merchants put *commenda* contracts into operation in order to increase their material prosperity. An exploration of the extensive legal and economic ramifications of the *commenda* must await a further study,[3] but for the purposes of this study it is necessary to outline the basic economic features of the *commenda* contract. These were as follows:

1. A sedentary investor, generally known as a *commendator*, delivered capital[4] into the possession of a travelling associate, generally known as a *tractator*.
2. The *tractator* might or might not add capital of his own to that of the *commendator*. If he did not, the contract is referred to by modern historians as a unilateral *commenda* since the capital was supplied by one party only. If he did invest some additional capital, it was usually a half of that contributed by the *commendator* and modern historians refer to the contract as a bilateral *commenda* since both parties supplied capital.

[2] Guido Astuti, *Origini e svolgimento storico della commenda fino al secolo XIII*, Documenti e Studi per la Storia del Commercio e del Diritto Commerciale Italiano 3 (Turin, 1933). Antonio Scialoja, *La commenda nel diritto commune del Mediterraneo dei secoli XI–XIII* in his *Saggi di storia del diritto marittimo* (Rome, 1946).

[3] Such a study related to a single port was the subject of my unpublished Ph.D. thesis: "The Commenda Contract in Mediterranean Maritime Commerce During the Thirteenth Century: A Study Based on Marseilles," University of Toronto, 1974. This article is a development of part of that thesis and owes much to several teachers who furnished valuable advice: in particular Professor A. Watson, Professor J. Gilchrist, Father L. Boyle, and Father W. Hayes.

[4] By capital is understood coinage, precious metals, merchandise, or a combination of all three.

3. The *commendator* might give certain directions concerning the management of the enterprise to be undertaken by the *tractator.*
4. The *tractator* took the capital away with him, generally overseas, and put it to work in some way.
5. On expiration of the time or voyages specified in the agreement made between the parties, the *tractator* returned to the home port to render account and divide the proceeds[5] with the *commendator.* Under certain circumstances, or by agreement with the *commendator,* the *tractator* could remit the proceeds without returning to the home port himself.
6. After allowing for expenses incurred and deducting the capital originally contributed by either or both parties, profit or loss was divided according to a ratio agreed upon in the original contract. Generally, and in the archetypal case, in a unilateral *commenda* the *commendator* received ¾ of any profit and bore all liability for loss while the *tractator* received ¼ of any profit and bore no liability for loss of capital. He lost the value of his labor of course. In a bilateral *commenda* any profit was usually divided ½–½ while the *commendator* bore ⅔ of any loss and the *tractator* ⅓. (This is the archetypal division of profit and loss for both forms of the *commenda* as found in the statutes and most contracts from ports such as Genoa, Venice, Amalfi, Marseilles, and Barcelona. There were, of course, many variations. At Dubrovnik, for example, the ¾–¼ division of profit for the unilateral *commenda* was not the rule at all.)

In addition to the economic structure of the contract, the juridical nature of the *commenda* and the medieval conception of it as a contract must be understood before proper analogies between it and other contracts can become apparent. Professor Udovitch's attempt to determine the origins of the *commenda* suffered severely from an inadequate analysis of the *commenda* itself; an analysis which led him to underestimate the possible influence of the *'isqa* and *chreokoinōnia* and to ignore altogether that of the Roman *societas* and *nauticum fenus.* In an essay as short as this, one would neither be able, nor wish, to examine in depth the juridical nature of the *commenda.* On the other hand, it is necessary to look at all aspects relevant to the succeeding discussion of the possible influence of other contracts. These may be grouped under two headings: the relationship between the unilateral and bilateral forms of the *commenda* and secondly the precise juridical nature of the contract. Just what kind of contract was the *commenda*?

The Unilateral and Bilateral *Commenda*

At the basic economic level a merchant's choice of whether to use a unilateral or bilateral *commenda* for a particular enterprise was largely determined by his own economic resources and by those of the party with

[5] By proceeds is understood the entire developed capital, that is, the original capital plus all profit made or minus all loss incurred.

whom he contracted. A *tractator* who had no personal capital of his own could contract a unilateral *commenda* only. On the other hand, if a *tractator* did have some capital of his own, it was in the best interests of the *commendator* to make the *commenda* a bilateral one. The rate of return would often have been higher when the capital was thus increased by fifty per cent.[6] The fact that the use of either form of *commenda* was largely occasioned by economic circumstances is well illustrated by extant Genoese notarial acts for *commenda* contracts. When a *tractator* had some capital but could not, or did not wish to, invest as much as a half of the amount proposed by the *commendator,* the Genoese combined a unilateral *commenda* with a bilateral one to meet the need. For example:

> Testes Lanfrancus Brugnun, Oger Brugnon, Petrus Iombardus, Bonus Vassallus. [*sic*] Caput Galli et Iordan de domo contraxerunt societatem in quam Bonus Vassallus lb. triginta et Iordanus lb. .xv. contulit Hanc Iordanus ultramare et inde quo maluerit Alexandriam vel Ianuam vel Buçeam ab Alexandria tamen Buçeam et Buçea Ianuam venire possit, tracto ipso capitali proficuum per medium. Ultra has portat idem Iordanus lb. .ciii. ipsius Boni Vassalli Capitis Galli, quo cum predicta societate iverit et debent expendere et lucrari per libram et de proficuo earum quartam habere debet ipse Iordan, in potestatem Capitis Galli venire debet et iste et alie. Actum in domum Capitis Galli, millesimo .clvii., .vi. kalendas septembris, indicione quarta.[7]

Here the *commendator,* Bonus Vassallus Caput Galli, invested in a bilateral *commenda* double the amount of capital available to the *tractator,* Iordan(us) de Domo, and then invested his excess capital of £103.0.0 in a unilateral *commenda* appended to the bilateral. The two forms were employed quite indifferently as a result of the amount of capital available to each of the two parties. There is also an extant notarial act for a dual *commenda* of this type at Marseilles.[8] Indeed, there seems every reason to believe that such a common-sense practice would have been widespread.

[6] Theoretically, the *commendator* received the same amount of profit regardless of whether a bilateral or unilateral *commenda* was used. If the *commendator* invested £100 and profit was 100%, he would gain ¾ × £100 = £75 from a unilateral *commenda* and ½ × £150 = £75 from a bilateral *commenda.*

[8] Louis Blancard, ed., *Documents inédits sur le commerce de Marseille au moyen-âge,* 2 vols. (Marseilles, 1884–1885), 2 (*Les notules commerciales d'Amalric*) no. 118. Blancard's edition of this cartulary is highly unreliable and should be avoided wherever possible.

The sole extant accounting of *commenda* voyages, that given at Genoa by a *tractator,* Ansaldo Baialardo, to his *commendator,* Ingo da Volta, for three voyages made in 1156, 1157, and 1158, provides further evidence that the form of contract used was determined by the economic resources available at the time to the parties in question.[9] In this case, the choice of form of contract for each of the three voyages was apparently determined by the capital available to the *tractator,* Ansaldo Baialardo. For the first voyage in 1156 he had no capital and the *commenda* therefore had to be unilateral. His share of the profit made on this voyage amounted to £18.10.0 and could have been invested in a bilateral *commenda* for the second voyage. However, perhaps because £18.10.0 was such a small sum in relation to the £254.14.1 which Ingo da Volta wished to invest in the second voyage, the partners apparently decided that Ansaldo should use his £18.10.0 on his own account separately from this £254.14.1, which he now received from Ingo in a second unilateral *commenda.* Ansaldo made a profit of £17.9.11 on his own £18.10.0 and in addition received £56.16.6 as his fourth share of the profit on the unilateral *commenda.* After the second voyage he had thus accumulated capital of £92.16.5. For the third voyage he invested a very worthwhile £64.8.8 in a bilateral *commenda* yet could still leave part of his accumulated profit in reserve. On the other hand, in addition to the £128.17.4 which he invested in this bilateral *commenda* for the third voyage, Ingo da Volta also supplied another £284.9.10 in a unilateral *commenda.* In this case, the *tractator's* fourth share of the profit was to be turned back into the bilateral *commenda,* meaning that he would receive only one eighth of the profit from the unilateral *commenda.* As Professor Astuti has said,[10] for these three successive voyages the two forms of *commenda* were used and adapted indifferently and cumulatively according to the capital available to the *tractator.*

If the choice between a unilateral and a bilateral *commenda* was determined for a particular voyage as much by the capital resources of the partners as by anything else, were the two forms of *commenda* considered to be different contracts or simply varieties of the same contract to be used in different circumstances? With the very notable exception of Astuti, modern historians have generally treated the unilateral and bilateral *commendae* as different

[9] Published in Guido Astuti, *Rendiconti mercantili inediti del cartolare di Giovanni Scriba,* Istituto giuridico della R. Università di Torino. Testi inediti o rari 3 (Turin, 1933). See also Florence Edler de Roover, "Partnership Accounts in Twelfth-Century Genoa," *Bulletin of the Business Historical Society* 15, no. 6 (Dec. 1941), 87–92.

[10] G. Astuti, "Ancora su le origini e la natura giuridica del contratto di *commenda* marittima," in *Mostra bibliografica e Convegno internazionale di studi storici del diritto marittimo medioevale: Amalfi — luglio–ottobre 1934,* 2 vols. (Naples, 1934–35), 1:1–28; here p. 7: "L'identità di struttura giuridica ed economica delle due forme emerge altresì nel modo più evidente e sicuro da alcuni documenti genovesi della metà del secolo XII, già da me pubblicati ed illustrati, che conservan testimonianza dei rapporti intercorsi per un periodo di più anni tra un capitalista ed un mercante, nei quali l'una e l'altra forma sono adottate indifferentemente ed anche cumulativamente a seconda della disponibilità patrimoniali del commerciante, e presentano, sotto ogni aspetto, la più completa identità nel loro funzionamento pratico."

contracts. The reason for this point of view lies simply in the circumstance that different names were often applied to the two forms in the Middle Ages. The names *commenda, comanda,* or *accomendatio* were often applied to the unilateral contract and the names *societas* (*maris*) or *compagnia* to the bilateral. However, even the nomenclature did not differentiate consistently between the two forms and it was, moreover, largely a question of local custom whether different names were used for the two forms or not. Where they were, it was simply for convenience rather than because there was any real difference between the two forms.

Amongst the municipal statutes, the *Constitutum Usus* of Pisa used *compagnia* for the unilateral *commenda* and *societas* for the bilateral, but only the one generic term *societas* when discussing provisions of the law applying equally to both forms of *commenda.*[11] Venetian legislation used the name *collegantia* and Amalfitan legislation the name *societas maris* for both forms of *commenda.*[12] The statutes of Pera, Genoa, and Marseilles treated *accomendationes* (Marseilles — *commande*) and *societates* together without differentiating between them in any way.[13] Elsewhere the statutes either mentioned one form only or else it is not clear whether the two forms were referred to by the same or by different names.[14] Nomenclature was also inconsistent in notarial

[11] Pisa, *Constitutum Usus* XXII (*De societate inter extraneos facta*), in Francesco Bonaini, ed., *Statuti inediti della città di Pisa dal XII al XIV secolo,* 3 vols. (Florence, 1854–70), 2:883–897. Both unilateral and bilateral *commendae* were included within the term *societas.* In par. 4, where division of profit and loss for the bilateral *commenda* was discussed, the term *societas* was used. In par. 8, where that for the unilateral *commenda* was discussed, the term *compagnia* was used.

[12] Venice, *Nove constitutiones sive leges que a domino Rainerio Dandulo . . . institute sunt* 16, in Enrico Besta, Riccardo Predelli, eds., "Gli statuti civili di Venezia anteriori al 1242," *Nuovo archivio veneto,* Nuova serie 1, parte 2 (1901), p. 251. This statute prohibited the *tractator* from investing in *collegantiae.* If *collegantia* was used for a contract in which he could not invest, there must have been unilateral *collegantiae* as well as the bilateral ones which were thus declared illicit. Amalfi, *Consuetudines civitatis Amalphae* 14, in Niccola Alianelli, *Delle antiche consuetudini e leggi marittime delle provincie napolitane* (Naples, 1871), p. 136.

acts for *commenda* contracts. At Genoa at least one bilateral *commenda* was called an *accomendatio*[15] and unilateral *commendae* were sometimes called *societates.*[16] Giovanni Scriba, who redacted the earliest extant Genoese notarial cartulary, twice used the term *societas ad quartum proficui* for a unilateral *commenda.*[17] Some Genoese notaries in the Levant towards the end of the thirteenth century used the term *societas sive accomendatio* in acts they recieved for unilateral *commendae.*[18] Venetian notarial acts used *collegantia* for the bilateral *commenda* but gave no name at all to the unilateral.[19] At Amalfi notarial acts appear to have used *societas* for the bilateral *commenda* while viewing the unilateral as a type of sale.[20] At Pisa and in Pisan-controlled Sardinia in the thirteenth century unilateral *commendae* were termed *societates maris.*[21] At Marseilles notaries sometimes confused the nomenclature for the two types of *commenda.* In 1248 Giraud Amalric used the term *comanda* for a bilateral *commenda* in which the *tractator* invested £54.10.0.[22] Conversely, in 1292, the notary Pons Marin termed a unilateral *commenda* a *societas.*[23]

[23] Ibid., série II, No. 12, fol. 81r.

This confusion in nomenclature resulted from a close identification of the two forms of *commenda* by the notaries in question. At Marseilles, because of the vastly greater number of unilateral contracts for which he received acts, Giraud Amalric became so habituated to the unilateral term *comanda* that on the occasion when he had to write an act for a bilateral *commenda*, he often initially wrote *comanda* without thinking and later cancelled it and replaced it by *societas* or *companhia*.[24] Indeed, for Amalric nomenclature was not determined by the nature of the investment of capital at all, but rather by the division of profit. If the *tractator* was to receive a quarter of the profit, Amalric termed the contract a *comanda*. If he was to receive a half of the profit, Amalric termed the contract a *societas* or *companhia*. Thus, in one act he originally termed the contract a *comanda* because it was unilateral but, after completing the act, realized that the *tractator* was to receive a half of the profit rather than a quarter and therefore changed *comanda* to *societas* and *companhia*.[25] Genoese notaries sometimes appear to have reasoned similarly. For example, in 1198 Bonvillano wrote an act for a bilateral *commenda* which he called an *accomendatio* apparently because the *tractator* was to receive only a quarter of the profit.[26] Guglielmo Cassinese and Giovanni Scriba both wrote acts for unilateral *commendae* which they called *societates* because in each case the *tractator* was to receive a half of the profit rather than a quarter.[27]

Close identification of the two forms of *commenda* was to be expected since they differed only in the method of investment of capital and the division of profit and loss. Notarial acts for the two forms of *commenda* were identical except for specifications concerning these points. Both consisted of a declaration of obligation by the *tractator* alone even though he also invested capital in bilateral *commendae*. The various clauses succeeded each other in the same order in acts for both forms of *commenda*. Specifications concerning the voyage and trading with the *commenda* were the same in both cases because the *tractator* alone had an active role during the voyage no matter what the form of *commenda*. Therefore, in both forms the *tractator* alone posted security against proper performance of his obligations. The *commendator* had no need to do so since he was presumed to have delivered his capital to the *tractator* prior to redaction of the notarial act for the contract and he then had no further obligations until the division of proceeds. Only then did the source of capital, whether the *commenda* was unilateral or bilateral, again become important.

In statutory law and notarial practice all indications are that the unilateral

[24] Ibid., série II, No. 1, fol. 60v: ". . . Et ego dictus Bertrandus confiteor quod in hac *comanda* (companhia) habent . . . ," and fol. 122v: . . . et recepisse in *comanda* (companhia) a te . . ."

[25] Ibid., série II, No. 1, fol. 71v. In the example given at n. 22 above, Amalric reversed his logic. The *tractator* was to receive only a quarter of the profit even though the contract was bilateral.

[26] *Bonvillano (1198)*, no. 234.

[27] *Guglielmo Cassinese (1190–1192)*, no. 32; *Giovanni Scriba*, nos. 355, 356 & 612.

and bilateral forms of *commenda* were regarded simply as varieties of the same contract. Where different names were used for the two forms, it was a practice used simply for convenience. The fact that the statutes of Marseilles, Genoa, and Pera discussed *accomendationes* (Marseilles — *commande*) and *societates* without differentiating between them in any way was indicative of the common identity of the two forms. So also was the use of a common *nomen juris* to embrace both forms in the *Constitutum Usus* of Pisa. Elsewhere there was sufficient confusion in nomenclature and reference to the two forms by the same name to indicate a common identity. We might add that the historical development of the two forms was so close as to almost preclude in itself the assumption that they were, in fact, different contracts. The bilateral *commenda* seems to have been the form in earliest use and the unilateral seems to have developed out of it.[28] The differences between the unilateral and bilateral *commenda* were simply alternative responses to slightly different circumstances. The flexibility of the *commenda* contract as a form of investment enabled *commendator* and *tractator* to modify it as they wished in order to cope with varying economic needs.

The Juridical Nature of the *Commenda*

Because the *commenda* was a development of the customary law of commerce rather than of juridical science, the earliest extant sources referring to it are notarial acts and municipal statutes. It is first referred to in 976 in its Venetian form of *collegantia* and the first extant notarial act for a *collegantia* contract dates from 1073.[29] Of the municipal statutes referring to *commendae* whose date can be fixed with certainty, the oldest is the Pisan *Constitutum Usus* of 1156; however, the *Tabula de Amalfa* of Amalfi and the *Ordinamenta et Consuetudo Maris* of Trani may originally have been promulgated prior to this. The statutes divide into two categories in their conception of the juridical nature of the *commenda*. At Venice and Amalfi, *commen-*

[28] Bilateral *commendae* were used more frequently during the early part of the commercial revolution but were displaced by unilateral *commendae* towards the end of the twelfth century. See Frederic C. Lane, "Investment and Usury," in *Venice and History: The Collected Papers of Frederic C. Lane* (Baltimore, 1966), p. 59 (reprinted from *Explorations in Entrepreneurial History,* ser. 2, 2 [1964], pp. 3–15), and Byrne, "Commercial Contracts," pp. 152–170. See also Hilmar C. Krueger, "Genoese Merchants, their Associations and Investments, 1155–1230," in *Studi in onore di Amintore Fanfani,* 6 vols. (Milan, 1962), 1:421, and André Sayous, "Les associations de caractère capitaliste à Venise entre le Milieu du XI^{e} siècle et celui du XII^{e}," *Académie des Inscriptions et Belles-Lettres. Comptes-Rendus des Séances,* Année 1933, pp. 441–443. The first extant unilateral *collegantia* does not appear at Venice till 1205 (see n. 19 above). In the statutes promulgated by Rainerio Dandolo (n. 12 above) the bilateral *collegantia* was banned. At Genoa the ratio of unilateral to bilateral *commendae* climbed from .38:1 in the period 1155–64 to 5.54:1 in 1200 (based on figures in Krueger, "Genoese Merchants," pp. 421–422).

[29] Morozzo della Rocca, *Documenti del commercio veneziano nei secoli XI–XIII,* no. 13. Translated in Robert S. Lopez, Irving W. Raymond, eds., *Medieval Trade in the Mediterranean World,* Records of Civilizations, Sources and Studies 52 (1955; rpt. New York, n. d.), pp. 176–177. The earliest mention of a *collegantia* is published in Julius von Ficker, *Forschungen zur Reichs- und Rechtsgeschichte Italiens,* 4 vols. (1868–74; rpt. Aalen, 1961), 4, no. 29 (p. 40).

dator and *tractator* were referred to as *creditor* and *debitor* respectively. This practice emphasized the idea of a debt owed for capital received. Thus, in the *Usus Venetorum* of 1204:

> Si autem rationem faciendo dixerit debitor quod habere colegantie sibi ceciderit uel fuerit sibi furatum, si ita iurauerit, habere non compellatur reddere creditori. Quod si dixerit quod naufragium habuerit uel fuerit captus uel eciam fuerit combustus (et ita legitimis testibus comprobauerit) tenebitur firmare quod ita sit suo sacramento.[30]

This chapter of the *Usus Venetorum* dealt with the means by which a *tractator* should render account to his *commendator* and in it the *tractator* was termed the *debitor* and the *commendator* the *creditor*. The case was the same in a chapter of the *Consuetudines civitatis Amalphae* of Amalfi dealing with the division of profit:

> . . . sed si datur [pecunia] in societate maris, de lucro creditor habebit tres quartas partes, reliqua quarta pars debitori pro suis fatigiis remanente. . . .[31]

It seems very likely that, as a consequence of the close historial relationship of Venice and Amalfi with Byzantium, the overtones of debt (*chreos*) recognized in the Byzantine *chreokoinōnia* (see below, p. 23) may have been inherited in the conception of the *commenda* held at Venice and at Amalfi.

Elsewhere in the Western Mediterranean municipal statutes stressed a relationship of *societas*, partnership, rather than of debt, between *commendator* and *tractator*. For example, at Marseilles the Statutes of 1253 referred to the *commendator* and *tractator* as *socii*, partners:

> . . . et ille qui taliter recepit [commandam] sine licencia vel consensu dicti socii vel commendatoris vel haeredem ejus . . .

and:

> . . . poterit petere seu proindre [sic] agere cum effectu adversus dictum commendatarium [tractatorem] vel socium aut eorum heredes vel successores . . .[32]

Tractator and *commendator* were similarly referred to as *socii* in the statutes of Genoa, Pera, and Pisa; in fact, in all statutes where they were referred to by any other name at all.[33]

[33] Genoa, "Breve genovese del Consolato de'Placiti," 6 (p. 84): "Si quis uero cum pecunia uel rebus alicuius iuit extra ianuam negotiatum et miserit (ianuam) merces uel res aliquas ego si inde ab aliquo socio eius aut accomendatario qui pecuniam ei in societate uel accomendatione dederit monitus fuero. . . ." Pera, *Statuti di Pera* 207 (p. 736): "Si quis in societate vel accomendacione vel mutuo aut emptione facienda pecuniam ab aliquo acceperit et in cursum iverit vel

Of all the municipal statutes, the Customs of Toulouse and the juridical commentary on them most demonstrably identified the *commenda* as a partnership, *societas*. The *commenda* as used by the merchants of Toulouse was described as follows in the Customs themselves:

> Noverint, etc. quod usus seu consuetudo est Tholose inter mercatores quod, si aliquis tradiderit alicui vina vel aliquam mercandariam causa ducendi seu deferendi in quibuscunque partibus extra Tholosam, videlicet ad quartum denarium quem recipiens debet de lucro recipere et habere vel ad majorem seu minorem partem . . .[34]

In the juridical commentary on the Customs, written some ten years after their promulgation, this *commenda* contract of the Toulousain merchants was identified with the Roman *societas* as described in *Digest* 17.2.29 and 17.2.30:

> *De societatibus* habemus rubricam et quia sepe societas inter aliquos contrahitur, ideo de actione pro socio videamus que actio ut competat titulus sit necessaria. . . . Tercium quod societas ista contrahatur ad commodiorem usum et uberiorem questum ad hoc ut locum habeat directa actio pro socio et hoc invenitur in Marcho Tullio, licet expressim verba ista in lege non ponantur, equipolencia tamen ponuntur. Nam dicitur in societate unius socii industriam multum conferre et sic propter unum sit comodior usus alterius et conquestus uberior et multociens habetur ratio dampni et lucri *ff. pro socio l. si non fuit* § *ita et* § *si. et l. Mucius.*[35]

As we shall see, the type of *societas* described in the *Digest* texts referred to here by the commentary on the Customs of Toulouse could be extremely similar to the *commenda*. To the author's knowledge, no other medieval text so clearly identified the *commenda* with this type of *societas* of Roman Law.

Because the *commenda* was a medieval contract, unknown in Roman times, the *Corpus Iuris Civilis* naturally contained no reference to it. Consequently, the medieval jurists did not discuss the *commenda* per se for they were interested in Roman Law rather than current commercial law. To the historian this lack of direct reference to the *commenda* in the works of the medieval jurists is particularly frustrating since he has the constant feeling that they were, in fact, alluding to the *commenda* in their glosses and commentaries but can seldom find concrete indications of it. On the other hand, because the *commenda* was unknown to Roman Law, the category of Roman Law contract under which medieval jurists did discuss a contract the same as the *commenda* in all respects must be indicative of the contract with which the *commenda* was most closely identified. This gives us an indication of the juridical conception of the *commenda* held by medieval society even if another name is used for the contract in the works of the jurists. For example, had the *commenda* been primarily considered as a type of trust or commission, the *mandatum* of Roman Law, its peculiar characteristics could be expected to

---

miserit sine socii voluntate in navi. . . ." Pisa, *Constitutum Usus*, XXII, par. 2 (p. 883): "Generaliter constituimus in omnibus maris societatibus in civitate faciendis, ut socius qui havere tractare debet. . . ."

[34] Toulouse, *Consuetudines Tholose* 72 (p. 110).

[35] *Commentarium Consuetudinum*, in Gilles, op. cit., p. 234.

have been discussed in glosses and commentaries on *mandatum.* Indeed, a *tractator*'s performance of a service on behalf of his *commendator* recalled the *mandatum.*[36] André Sayous hypothesized that the word *commenda* was in fact derived from *cum mandare.*[37] However, the *commenda* differed from the *mandatum* in that the services of a *tractator* were not gratuitous as were those of a mandatee. Medieval jurists did not discuss a non-gratuitous form of *mandatum* and thus would not seem to have identified the *commenda* with the *mandatum.* In addition to *mandatum,* there were still other contracts of Roman Law with which the *commenda* had certain characteristics in common but from which it differed in various ways: for example, *depositum* and *nauticum fenus.* However, we do not find discussion of any of the peculiar *commenda* characteristics under the titles of these contracts either. In fact, the only contract of Roman Law under which medieval jurists did discuss a contract similar to the *commenda* in all respects was *societas:* specifically, the *societas* of labor and capital.

Medieval jurists approved of the *societas* of labor and capital as outlined in the *Corpus Iuris Civilis.* Moreover, they went further and sought to answer the question of whether the capital-investor could receive more than half the profit if, as in the case of a *commenda,* the labor-investor was held liable for no loss of capital. (In the *Corpus Iuris Civilis* the labor-investor could be held liable for no loss of capital only if the value of his labor lost was equal to that of the capital lost. This meant that the value of the investment of both parties was equal and therefore any profit had to be divided equally also.) The mere fact that the medieval jurists did attempt to answer this question, which was not even posited in the *Corpus Iuris Civilis,* indicates that they may have had in mind the practice in current use in the *commenda* whereby the capital-investor, the *commendator,* received three quarters of the profit even though the labor-investor, the *tractator,* was liable for no loss of capital.[38] Some medieval jurists in fact agreed that whatever division of profit and loss was agreed upon by the partners ought to be respected, provided that it did not make the *societas* leonine.[39] These included the authors of *Lo Codi* and the *Summa Codicis des Irnerius* in the twelfth century,[40] Cino da Pistoia in the

[36] See Adolf Berger, *Encyclopedic Dictionary of Roman Law,* Transactions of the American Philosophical Society, New Series 43, part 2 (Philadelphia, 1953), pp. 574–575.

[37] André Sayous, "Les méthodes commerciales de Barcelone au XIII[e] siècle, d'après des documents inédits des archives de sa cathédrale," *Estudis Universitaris Catalans* 16 (1931), 155–198; here p. 165.

[38] That is considering the capital invested by the *commendator* only in the case of a bilateral *commenda.* That invested by the *tractator* was subject to entirely different principles since he also invested the labor to work it.

[39] A leonine *societas:* one in which a single partner took all the profit and was liable for no loss. So called from Aesop. Such a *societas* was invalid according to Ulpian in *Digest* 17.2.29.2.

[40] H. Fitting, ed., *Lo Codi: Eine Summa Codicis im provenzalischer Sprache aus der Mitte des XII Jahrhunderts.* Erster Teil: *Lo Codi in der lateinischen Ubersetzung des Ricardus Pisanus* (Halle, 1906), 4.57.8 (pp. 121–122); and edited by the same author, *Summa Codicis des Irnerius* (Berlin, 1894), 4.37.6.

thirteenth,[41] and, at the end of the fourteenth, Petrus de Ubaldis, the author of the most authoritative medieval treatise on partnerships. Petrus wrote:

> Nam si decernimus ex quo interuenit pactum praedictum, quod damnum esset meum, lucrum verò commune: licet principio casu: fortuito omnia sint concremata tempore, quo operae correspondebant solum parti sortis, et interusurio totius, et non toti sorti, tamen totum damnum debet esse meum, quia ita conuentum est.[42]

However, guided by the principles concerning *societas* which were enunciated in the *Corpus Iuris Civilis,* the most eminent thirteenth-century jurists, Azo, Accursius, and Odofredus, could not but conclude that such a division of profit and loss was illegitimate. The basis of their argument was that, notwithstanding *Digest* 16.3.1.6 ("Si convenit, ut in deposito et culpa praestetur, rata est conventio: contractus enim legem ex conventione accipiunt."), such a division of profit and loss was contrary to the *ius fraternitatis* which was intrinsic to *societas.*[43]

Whereas the medieval jurists of Roman Law made no direct reference to the *commenda* which would enable us to conclude unequivocally that they identified it with the *societas* of labor and capital, there are at least three separate indications in canonistic literature that the *commenda* was considered a *societas* of labor and capital. The first of these occurs in commentaries on Innocent III's decretal *Per vestras* of 1206.[44] In this decretal Innocent advised the archbishop of Genoa that the dowry of a woman whose husband was shiftless should be invested with a merchant so that her share of the profit might support the marriage. The situation was obviously analogous to that of a *commenda.* The woman provided capital, the merchant labor, and the profits were shared. Hostiensis maintained that Innocent had intended

[41] Cino da Pistoia, *Cyni Pistoriensis in Codicem et aliquot titulos primi Pandectorum tomi . . . commentaria,* 2 vols. (1578; rpt. Turin, 1964), 4.37.1 (1:257A): "Duo contrahunt societatem, et vnus affert pecuniam, alter ponit operam vt hac lege. Modò quaeritur in proposito, cuiusmodi partes societatis habebunt? Respondeo, quod primo standum est conuentioni, vt Dig., depositi. lex 1. §. si conuenerit [*sic*]."

Turin, 1969), 17.Pro socio.Si non fuerint (fol. 263r): f Societati]; and Odofredus, *Lectvra svper Digesto Veteri,* Opera ivridica rariora, No. 2, 1 and 2, 2 vols. (1550; rpt. Bologna, 1967–68), 17.Pro socio.Si non fuerint (vol. 2, fol. 90v).

[44] *Decretalium d. Gregorii Papae IX compilatio* 4.20.7, in Emil A. Friedberg, ed., *Corpus iuris canonici. Editio lipsiensis secunda,* 2 vols. (1879–81; rpt. Leipzig, 1928).

that the woman should bear no liability for loss but subsequent canonists disagreed.[45] It would, in fact, have been usurious had the merchant been liable for loss of the capital and there seems little doubt that Innocent intended the woman to bear liability for loss just as in a *commenda*. The decretal itself did not give a name to the contract proposed but subsequently the canonists, without exception, interpreted it as referring to investment in a *societas* of labor and capital.[46] The second indication that the *commenda* was considered a *societas* of labor and capital is found in the treatise, *De usuris,* of the Franciscan canonist and theologian Alexander of Alexandria who defended his thesis in a public disputation at Genoa towards 1303. In *De usuris* he defended a contract which he referred to as *pecunia commendata* and *pecunia commodata*. By these terms Alexander must surely have been referring to the Genoese *accomendatio* since he defended the contract on the grounds that the investor retained the ownership of, and therefore the liability for loss of, the capital which he invested with another. He could, therefore, legitimately take a share of the profit.[47] Significantly, he had taken this argument directly from St. Thomas Aquinas's defence of the *societas* of labor and capital.[48] The final reference is in Panormitanus's *Lectura in Decretales* of the early fifteenth century where *societas* of labor and capital was referred to as a contract in everyday medieval use. In commenting on Gregory IX's decretal *Naviganti,* which had condemned sea loans, Panormitanus asked the question: if sea loans were illicit, what about those people who contracted *societates* of labor and capital "quotidie"?[49] His answer to the question need not concern us. What is important is his reference to the *societas* of labor and capital as a contract in daily use at the time. This need not have been the *commenda* itself of course. By the fifteenth century partnerships had become much more varied in form and, although the classic twelfth- and thirteenth-century form of *commenda* still survived, there were also other variant types of partnerships of labor and capital.[50] Never-

[48] Aquinas, loc. cit.

[49] Panormitanus, *Lectura in Decretales,* 5.De vsuris.Naviganti,11 (vol. 6, fol. 65r): "Sed extra glossam quero pro declaratione prime partis canonis. hic non est licitum mutare et aliquid recipere vltra sortem etiam si creditor suscipiat in se periculum: numquid in istis qui quotidie contrahunt societatem et vnus apponit operam et alius pecuniam."

[50] For the later development of the *commenda,* particularly in France, see R. Saleilles, "Etude sur l'histoire des sociétés en commandité," *Annales de droit commercial* 9 (1895), 10–26, 49–79; 11 (1897), 29–49.

theless, Panormitanus's comment points to his conception of various forms of medieval partnerships as being *societates* of labor and capital as formulated in the *Corpus Iuris Civilis*. When the *commenda* was in widespread use in the thirteenth century, would it not also have been regarded as a *societas* of labor and capital? Together with the evidence of the municipal statutes, that of the canonists and jurists of Roman Law would support the assertion.

The Origins of the *Commenda*

(1) *Societas* of Labor and Capital

If we then acknowledge that in the Middle Ages the juridical conception of the *commenda* was as a *societas* of labor and capital, what are the possibilities that the *commenda* was, in fact, descended from this contract? A Roman *societas* was "a union of property, skill or labor, or any combination of these for a common purpose or exploitation."[51] Within the genus of *societas* a wide range of partnership relationships could be encompassed; the *societas* of labor and capital was only one of these. It was a *societas* in which one partner contributed capital while the other contributed his labor or a combination of labor and capital together. Obviously the economic relationship was extremely similar to that of the medieval *commenda*. Such a *societas* of labor and capital was pronounced legitimate in *Codex* 4.37.1 ("Societatem uno pecuniam conferente alio operam posse contrahi magis obtinuit.") and *Institutes* 3.25.2 (". . . nam et ita coiri posse societatem non dubitatur, ut alter pecuniam conferat, alter non conferat et tamen lucrum inter eos commune sit, quia saepe opera alicuius pro pecunia valet."). The justification was given by Ulpian in *Digest* 17.2.5.1 that the value of the one partner's labor was commensurate with that of the other's capital. ("Societas autem coiri potest et valet etiam inter eos, qui non sunt aequis facultatibus, cum plerumque pauperior opera suppleat, quantum ei per comparationem patrimonii deest.") Therefore both partners could be considered to have contributed equally to the *societas*.

Labor and capital could thus be invested in a Roman *societas* in the same way as they were to be in the medieval *commenda*. Moreover, in *Digest* 17.2.29.pr. Ulpian also provided a basis for the type of division of profit found in the *commenda:*

> Si non fuerint partes societati adiectae, aequas eas esse constat, si vero placuerit, ut quis duas partes vel tres habeat, alius unam, an valeat? placet valere, si modo aliquid plus contulit societati vel pecuniae vel operae vel cuiuscumque alterius rei causa.

Here unequal division of profit was pronounced acceptable if one partner invested more than the other in the *societas*. This extra investment could be in the form of capital, labor or anything else: skill, knowledge, or connections perhaps. Ulpian went on to allow the labor-investor of such a *societas* to bear no liability for loss of capital but nevertheless to share in the profit:

[51] W. W. Buckland, *A Manual of Roman Private Law*, 2nd ed. (Cambridge, 1953), p. 294.

> Ita coiri societatem posse, ut nullam partem damni alter sentiat, lucrum vero commune sit, Cassius putat: quod ita demum valebit, ut et Sabinus scribit, si tanti sit opera, quanti damnum est: plerumque enim tanta est industria socii, ut plus societati conferat quam pecunia, item si solus naviget, si solus peregrinetur, pericula subeat solus.[52]

As with division of profit, so also with liability for loss; the *Digest* provided a structure for division which could be very similar to that which was to be characteristic of the *commenda*. The labor-investor could be liable for no loss of capital provided that the value of his labor lost had been equal to that of the capital lost and both partners could therefore be considered to have lost equally. In such a case, any profit would have had to have been divided equally since the two partners had invested equally: the one his labor and the other his capital. This was the sole economic difference between the Roman *societas* of labor and capital and the medieval *commenda*. As we saw, the medieval jurists attempted to resolve precisely this difference.

At the juridical level the major difference between *commenda* and *societas* of labor and capital lay in the fact that the *commenda* was a real contract whereas the *societas* was consensual.[53] A *tractator* of a *commenda* became bound to undertake the voyage agreed upon only after he had taken possession of the capital from his *commendator*.[54] In being real the *commenda* was one with the *nauticum fenus, chreokoinōnia, 'isqa,* and *qirād*.[55] Having evolved in a commercial sphere in which these other contracts either had been used or were currently being used for analogous purposes, it is not surprising that the *commenda* was also a real contract even though in so being it differed from the *societas* of Roman Law. Moreover the difference between reality and consensuality was not insurmountable and does not preclude development from the *societas* to the *commenda*.[56]

[52] *Digest* 17.2.29.1. Cf. *Institutes* 3.25.2.

[53] A consensual contract became binding on the parties concerned when merely a consent (*consensus*) of the parties existed and was expressed. This was opposed to a real contract which was made binding by the handing over of some thing (*res*) by the one party to the other. See Berger, *Encyc, Dict. Rom. Law,* pp. 408, 413.

[54] See below, p. 33.

[55] The *nauticum fenus* was real as were all Roman loans. (Berger, op. cit., p. 591) The *qirād* also did not become binding until the labor-investor had taken possession of the capital (below, p. 33). Evidence for the *chreokoinōnia* and *'isqa* is inconclusive but they also appear to have been real since the laws concerning them commenced with the premise that possession had been transferred to the labor-investor. *Chreokoinōnia*: *A* gives gold or silver for the service of a partnership . . . (below, p. 23). *'isqa*: If a man accepted an *'iska* from his fellow . . . (Isidore Epstein, ed., *The Babylonian Talmud. Seder Neziḳin*. Vol. 2: *Baba Meẓia* (London, 1935), 105a (p. 598). The operative words are "give" and "accept" which accorded directly with usage for the *commenda* (see n. 103).

[56] In *West Roman Vulgar Law: The Law of Property*, Memoirs of the American Philosophical Society 29 (Philadelphia, 1951), Ernst Levy pointed to the decline of the classical Roman Law concepts of transfer of ownership via purely consensual contracts such as sale (*emptio-venditio*) during the later empire. In vulgar law such contracts tended to become overlaid with the requirement of *traditio*.

Insistence upon possession of *commenda* capital by the *tractator* was a consequence of a feature which further differentiated the *commenda* from the Roman *societas:* the tractator's independence in the conduct of the enterprise and the anonymity of the *commendator* in relationship to third parties. Whereas direction of the enterprise was common to all partners in a Roman *societas,*[57] the *commendator* had no active direction of the enterprise in a *commenda*. If he wished to have even a passive role he had to specify his requirements in the original contract. Furthermore, a *tractator* acquired rights with respect to third parties on his own behalf only. The *Constitutum Usus* of Pisa declared that a *commendator* had rights with respect to third parties only in cases of improper conduct by the *tractator:* when a *tractator* deliberately disposed of a *commenda* against the best interests of the *commendator*, when a *tractator* exchanged the *commenda* capital for something else while still in his home port before leaving on his voyage, and when a third party had been in collusion with the *tractator* to defraud the *commendator.*[58] It should be added here that historians have long considered the *commenda* as an early example of limited liability in a partnership on the grounds that the *commendator* was not liable for debts contracted by the *tractator* on behalf of the *commenda* beyond the capital which he had originally invested.[59] By the sheer logic of the case this would seem to be so but, to the present author's knowledge, there is not the slightest concrete evidence to either affirm or deny it. If it was the case, then, combined with the *commendator*'s lack of rights with respect to third parties, it constituted yet another deviation from the *societas* of Roman Law. In the latter contract partners held rights with respect to third parties in common and were liable for the debts of the *societas* beyond the amount of their initial investment.[60]

Were we to look for the origins of the *commenda* in the *societas* of labor and capital, these differences would not appear to be insurmountable. The merchant community of the early Middle Ages was sufficiently practical and eclectic to have adjusted the *societas* to suit its needs and to have incorporated desirable features of other contracts in so doing. The main changes that would have been necessary were a relaxation of the rules governing division of profit and loss; an adjustment to the principles of liability; a restriction of the management of the enterprise to one partner; and a change from the consensual method of contracting to the real. Moreover, both the unilateral and bilateral forms of *commenda* could have evolved from the *societas* of labor and capital. The *Digest* made no distinction between a *societas* of the type in which the labor-investor invested no capital and one in which he did invest some capital in addition to his labor. He simply supplied labor equal in value to the extra capital invested by the capital-investor. Whether that was all of the capital or only part of it was quite irrelevant. In the Middle Ages, after

[57] *Digest* 17.2.64.

[58] Pisa, *Constitutum Usus* XXII, paragraphs 6, 11 (pp. 885, 887–888).

[59] See, for example, Lopez and Raymond, *Medieval Trade,* p. 174.

[60] *Digest* 17.2.27, 17.2.82. Cf. Berger, op. cit., p. 708.

the rediscovery of the *Digest,* this principle was perfectly well understood by the jurists. Most of them simply talked about one partner investing *pecunia* and the other *opera* but they did so purely as the archetypal case. Occasionally jurists made it clear that both the unilateral and bilateral forms were legitimate according to the *Digest.* For example, in his *Summa* on the *Decretales* of Gregory IX, Godfrey of Trani wrote:

> Vis autem dare pecuniam nauiganti vel eunti ad nundinas seu alii mercatori sine peccato pone tu pecuniam et alius operam personalem et pecuniam tantum vel minorem. plerumque enim quod pecunie deest opera suppletur ut Dig., pro socio. lex 5. § . 1. et connicetis [*sic*] pericula lucra et damna.[61]

However, it was Petrus de Ubaldis who pointed out most succinctly that the unilateral and bilateral forms were but variations on the principle of the *societas* of labor and capital:

> . . . et tunc . . . unus posuit pecuniam, et alter operam, vel mistim pecuniam et operam . . .[62]

The similarities between the *commenda* and the *societas* of labor and capital were striking at the very least. The mere fact that in the Middle Ages the *commenda* was regarded as a form of *societas* in statutory law would be enough to make us suspect its ultimate origins in the Roman *societas* of labor and capital even without other evidence. We must acknowledge that the *commenda* was a development of early medieval commercial law and practice but beyond that we may search for influence and the origins of ideas and characteristics. Few ideas were ever totally original in customary law in the Middle Ages. Well-defined institutions such as the *commenda* were invariably the product of long evolution and an eclectic adoption of ideas from many quarters. The other contracts which may have contributed to the development of the *commenda* should therefore be looked at in the light of an assessment of the extent to which each could have, or was likely to have, added its own peculiar characteristics to those of the *societas.*

(2) *Nauticum fenus*

The Roman sea loan, *nauticum fenus,* was a contract *sui generis,* quite distinct from, although akin to, the ordinary loan, *mutuum.* Like the medieval *commenda* a sea loan was contracted for the duration of a voyage and it was the lender, the party supplying the capital, who was liable for any loss incurred at sea. The loan was repaid only if the ship arrived safely in port with its cargo.[63] Consequently rates of interest were higher than for ordinary

[61] Godfrey of Trani, *Summa perutilis et valde necessaria domini Goffredi de Trano super titulis Decretalium* (Lyon, 1519), 5.De vsuris.12 (fol. 221v).

[62] Petrus de Ubaldis, *Tractatvs de dvobvs fratribvs* 4.2 (pp. 31–32).

[63] *Codex* 4.33.5 (4): "Traiecticiae quidem pecuniae, quae periculo creditoris mutuo datur, casus, antequam ad destinatum locum navis perveniat, ad debitorem non pertinet."

There are no extant Roman sea loan contracts but early medieval contracts show these points

loans.[64] On the other hand, the sea loan differed from the *commenda* in that the lender was liable for no loss other than that incurred at sea and in that he received a fixed percentage return on his capital rather than a share of whatever profit the borrower happened to make.

Even though the sea loan continued in use into the Middle Ages, a contract such as the *commenda* might have developed from the *nauticum fenus* as a result of disrupted economic conditions following the collapse of the Roman Empire.[65] With the virtual collapse of Mediterranean homogeneity the climate for commerce became less favorable and information about markets and supplies less reliable. Risk of loss from seizure abroad, robbery, sudden changes in political conditions, and unreliable information would have made invalid the assumption that a reasonable profit was to be made if the dangers of navigation could but be overcome. Investors may have accepted liability for all loss in order to attract agents willing to carry their goods in perilous situations. They may have abandoned the security of a loan at fixed interest in return for a share of what might be a very large profit. Agents may have preferred to return a share of the profit, even a large share, rather than a fixed interest since a profit was not assured even if the voyage was successfully accomplished. However, all these assumptions seem improbable. The *societas* of labor and capital was much closer to the *commenda* than the *nauticum fenus* and if the *commenda* developed from either one of the Roman contracts it would surely have been from the *societas*. If the *nauticum fenus* had any influence it was probably in the area of developing the idea of the capital-investor's liability for loss.

(3) *Chreokoinōnia*

The *chreokoinōnia*, which was apparently used at Byzantium for investment in maritime commerce, was a form of partnership with overtones of a debt. *Chreos* signified debt and *koinōnia* partnership. Unfortunately our knowledge of the *chreokoinōnia* is derived entirely from one brief legal text in the *Rhodian Sea Law* of the seventh or eighth century. In Ashburner's translation it reads:

> *A* gives gold or silver for the service of a partnership. The partnership is for a voyage, and he writes down as it pleases him till when the partnership is to last. *B*, who takes the gold or the silver, does not return it to *A* when the time is fulfilled, and it comes to grief through fire or robbers or shipwreck. *A* is to be kept harmless and to receive his own again. But if, before the time fixed by the contract is

clearly. See Calvin B. Hoover, "The Sea Loan in Genoa in the Twelfth Century," *Quarterly Journal of Economics* 40 (1925–26), 495–529; here pp. 496, 502. Examples in *Giovanni Scriba*, nos. 32 (navi Georgii sana eunte Tunisim et redeunte), 179, 218, 219, 238, 239, 240, 295, etc. It was tacitly assumed that the borrower would arrive at the specified destination together with the ship and its cargo; however, this also was specified sometimes in the contracts. Ibid., nos. 104 (navi in qua vado sana eunte Alexandriam et inde redeunte), 106, 113, 114, 119, 120, 197, 231, 329, etc.

[64] The rate of interest was unlimited until fixed by Justinian at 12%. Berger, op. cit., p. 469.

[65] See Astuti, *Origini . . . della commenda*, pp. 125–127.

> completed, a loss arises from the dangers of the sea, it seemed good that they should bear the loss according to their shares and to the contract as they would have shared in the gain.[66]

As this text presents it, the *chreokoinōnia* seems to have been a partnership in which one partner contributed capital and the other labor just as in the *societas* of labor and capital. *Chreia* and *chreos*, the words appended to *koinōnia* and signifying need[67] and debt respectively, indicate that the partnership was considered to have overtones of a debt owed for capital received by the labor-investing partner from the capital-investing partner and that the labor-investor had a need for capital. Moreover, the *chreokoinōnia* was similar to the *nauticum fenus* and *commenda* in that it was contracted for a sea voyage although the duration of the contract was apparently at the will of the partners.

In the article "At the origins of the Western Commenda: Islam, Israel, Byzantium?" Udovitch dismissed the *chreokoinōnia* as a possible origin of the *commenda* on the grounds that in the *chreokoinōnia* the labor-investor's liability for loss corresponded to what his share of the profit would have been had there been any. In the *commenda* the labor-investor or *tractator* was not liable for any loss of capital. On the basis of Ashburner's translation this would appear to have been the case. However, the *chreokoinōnia* should not be dismissed so easily. The final clause of the *Rhodian Sea Law* text is all important and its true meaning is clearer if the Greek text is translated more literally than it was by Ashburner:

> . . . just as it seems right [to receive shares] of the gain, [so] it seems right to assume the losses in proportion to the shares according to the agreements.[68]

It does not seem that shares of loss necessarily had to correspond to anticipated shares of profit as suggested by Ashburner's translation and interpreted by Udovitch. Rather, the partners simply bore shares of loss, and received shares of profit, in whatever proportions they had agreed upon in

[66] Walter Ashburner, ed., ΝΟΜΟΣ ΡΟΔΙΩΝ ΝΑΥΤΙΚΟΣ: *The Rhodian sea-law* (Oxford, 1909), 3.17 (p. 97). Greek text γ. ιζ' (p. 22): ιζ' *ἐάν τις δώσῃ ἐπὶ χρείᾳ κοινωνίας χρυσίον ἢ ἀργύριον καὶ ταύτην κατὰ πλοῦν καὶ ἐγγράψηται καθὼς ἀρέσει ἕως πόσου χρόνου τῇ χρεοκοινωνίᾳ, ἐὰν ὁ λαμβάνων τὸ χρυσίον ἢ τὸ ἀργύριον πληρωθέντος τοῦ χρόνου μὴ ἀποστρέψῃ αὐτὸ τῷ κυρίῳ αὐτοῦ καὶ συμβῇ ἀπὸ πυρὸς ἢ λῃστῶν ἢ ναυαγίου περιπεσεῖν, ἀζήμιον μένειν τὸν κύριον τοῦ χρυσίου καὶ σῶα τὰ ἴδια ἀπολαμβάνειν. ἐὰν δέ, τοῦ χρόνου τῶν συνθηκῶν μὴ πληρωθέντος, συμβῇ ἐκ τῶν κατὰ θάλασσαν κινδύνων ἀπώλειαν γενέσθαι, καθάπερ τοῦ κέρδους ἔδοξε καὶ τὰς ζημίας πρὸς τὰ μέρη καὶ τὰς συνθήκας ἀναδέχεσθαι.*

[67] Ashburner translated *chreia* as "service." "Need" seems more accurate. In the table of contents of the *Rhodian Sea Law*, the form is *κερδοκοινωνία*, that is, a partnership for profit.

[68] In place of *καὶ τας συνθήκας* the strongest manuscript tradition has *κατὰ τὰς συνθήκας* (note on *καὶ*, Ashburner, op. cit., p. 97). Therefore I have translated *πρὸς τὰ μέρη καί* [*κατα*] *τὰς συνθήκας* as "in proportion to the shares according to the agreements." This reading is supported by the fact that *καὶ* (which the other manuscripts have) can mean "that is" as well as "and." *πρὸς τα μέρη καί τὰς συνθήκας* could be translated as "in proportion to the shares, that is, to the agreements."

the contract. Nothing could be more reasonable and the *Rhodian Sea Law* did not in fact demand that each partner's share of loss had to correspond to his share of profit. That may have been the case in individual contracts but it would have been a matter for agreement, as also would have been the opposite case: differential sharing of profit and loss.

In the *Ecloga* of Leo III the Isaurian (a compilation made during the reign of Leo III, 717–741, in an attempt to bring the *Codex* up to date by incorporating contemporary laws and practices) there is a chapter in which the partners' shares of loss definitely were made to correspond to their shares of profit. This text has been taken to refer to the *chreokoinōnia* by historians but, in fact, it mentions nothing other than *koinōnia*, partnership:

> Either in writing or not in writing, a partnership is constituted between two, or even more, whenever each of them contributes his own, either equal or lesser, share; or when some contribute capital and others their own labour. [They ought] to divide the profit accruing to them according to the agreements reached between them with subtraction of the initial capital funds, clearly. And if such a partnership should sustain a loss to the capital, each partner ought to meet it according to his own proper share of the gain.[69]

There seems no reason not to see this text as a simple legacy of the Roman *societas* of labor and capital, perhaps transmitted via *Codex* 4.37.1. The arrangements for division of profit and loss would perhaps represent current practice at Byzantium in the early eighth century. However, since there is no mention of a sea voyage or any reference to the idea of a debt or loan involved, there is no reason to identify the *koinōnia* of the *Ecloga* text with the *chreokoinōnia* of the *Rhodian Sea Law*. The *chreokoinōnia* may have been an application to maritime commerce of the more general *koinōnia* of labor and capital which was itself derived from the *societas* of labor and capital.

As Astuti has maintained,[70] the *chreokoinōnia* could well have influenced the development of the *commenda*. It is significant that the only indications of direct influence on the *commenda* come from Byzantium and the *chreokoinōnia*. Professor Lopez has suggested Byzantine influence on the Venetian *collegantia* in the curious use of *iactare* to describe the *commendator's* method of investment in a *collegantia*. He finds its origin indicated in a passage of the life of St. Spyridon by Theodore of Paphos where the verb βαλη (to throw) is used to describe investment in a Byzantine coasting voyage.[71] In reading

[69] Iōannēs D. Zepos and Panagiōtēs I. Zepos, eds., *Jus graecoromanum*, vol. 2 (1931; rpt. Aalen, 1962), Ἐκλογη Νομων, ι. ε (pp. 41–42):
ε'. Συνίσταται κοινωνία ἐγγράφως ἢ ἀγράφως μεταξὺ δύο ἢ καὶ πλειόνων, ὁπόταν ἕκαστος αὐτῶν ἐξ ἰσότητος ἢ καὶ ὑπ' ἔλαττον τὴν οἰκείαν συνεισαγάγῃ μοῖραν, ἢ τινων μὲν ἐνθήκην ἑτέρων δὲ τοὺς ἰδίους μοχθους καταβαλλομένων. τὸ δὲ περιποιούμενον αὐτοῖς κέρδος, μεθ' ὑφαίρεσιν δηλονότι τῶν κεφαλαίων, κατὰ τὰ ἐν μέσῳ αὐτῶν στιχηθέντα ἐπιμερίζεσθαι. εἰ δὲ συμβῇ ἐπὶ τῇ τοιαὐτῃ κοινωνίᾳ τῇ ἐνθήκῃ προσγενέσθαι ζημίαν, ἕκαστον κοινωνὸν κατὰ τὴν ἰδίαν τοῦ κέρδους μοῖραν καὶ αὐτὴν ἐπιγινώσκειν.

[70] Astuti, *Origini . . . della commenda*, pp. 125–133, and "Note sulla collegantia veneta," *Rivista del diritto della navigazione* 7, parte 1 (1941), 71–138; here pp. 83–118.

[71] Robert S. Lopez, "The Role of Trade in the Economic Readjustment of Byzantium in the

municipal statutes dealing with the *commenda*, I myself was struck by the fact that the partners of *commenda* contracts were described as *creditor* and *debitor* only in those ports with the strongest traditional connections with Byzantium: Venice and Amalfi (see above, pp. 13–14). In view of these points of connection, and in view of the fact that an outright dismissal of the *chreokoinōnia* over the principles of liability for loss cannot be sustained in a closer reading of the *Rhodian Sea Law*, we must at least consider the *chreokoinōnia* seriously as a possible source of *commenda* characteristics. It may well have been the intermediary between the *societas* of labor and capital and the *commenda:* the stage at which the principle of the *societas* of labor and capital became utilized in maritime commerce.

(4) *'isqa*

The Jewish *'isqa* contract was described by the *Babylonian Talmud* as a "semi loan and a semi trust".[72] Although all capital was provided by a single capital-investor, half of it was regarded as an interest-free loan which had to be returned regardless of the outcome of the venture. The other half was regarded as a trust to be returned with a share of any profit made on it. However, if it was lost, this trust half did not have to be returned. The *Talmud* mentioned two methods of dividing profit and loss. The investor either bore two thirds of the loss and received a half of the profit or else he bore a half of the loss and received a third of the profit.[73] This Talmudic pattern remained the classic one for division of profit and loss right into the Middle Ages. For example, consider this record of an *'isqa* whose details are recorded in a *responsum* of the *Sefer Hadinim* of Rabbi Judah haCohen:

> Q. *A* gave a *minah* to *B* for investment purposes, but did not stipulate any conditions. *B* earned profit with the money until the combined sum was two hundred *dinars*. When they came to divide the profit, *A* wanted to take one half of such profit. *B*, however, told him that he was entitled to one third of the profit only, since in case the business transactions would have produced a loss, *A* would have insisted on being charged with no more than half of such loss.
> A. If at the beginning *A* had specified that he expected to receive one half of the profit — *A* would then be charged with two thirds of such loss. If, however, *A* had originally specified that he would not be responsible for more than one half of the loss, he would then be entitled to receive but one third of the profit. Since at the time the partnership [*'isqa*] was concluded the manner of dividing loss and profit was not specified and since under such circumstances if the business of the partners resulted in a loss, *A* would have been charged with two thirds of the loss (since usury is a Scriptural tort, and in case of doubt *A* would have been charged

Seventh Century," *Dumbarton Oaks Papers* 13 (1959), 68–85; here p. 81. The same expression still exists in English of course. Other historians have also stressed the connection between the *chreokoinōnia* and the *collegantia*. See Roberto Cessi, "Note per la Storia delle società di commercio nel medio evo in Italia," *Rivista italiana per le scienze giuridiche* 59 (1917), 3–95, 181–224; esp. pp. 18 ff., 182–183.

[72] *Babylonian Talmud. Seder Neziḳin.* Vol. 2: *Baba Meẓia*, 104b (p. 598): "The Nehardenas said: An *'iṣḳa* is a semi loan and semi trust. . . ."

[73] Ibid., 68b (p. 400).

> with the harsher alternative) — now that there is a profit, *A* is entitled to one half of that profit: For in this type of partnership, when the active partner receives no compensation whatever for his effort, the Talmud rules that only two arrangements are non-usurious: either the passive partner is charged with two thirds of the losses and is then entitled to one half of the profits; or he is charged with but one half of the losses, and is then entitled to one third of the profits.[74]

In this *responsum* Rabbi haCohen simply reiterated the Talmudic formulae. However, by the twelfth and thirteenth centuries greater flexibility in the division of profit and loss seems to have developed in the Mediterranean.[75] Maimonides (1135–1204) declared that almost any division of profit and loss was permissible provided that the labor-investor's share of profit remained greater than his share of loss.[76] He reported various views held by his teachers and other authorities but that which he represented as being the most widely accepted was as follows.[77] The labor-investor received all profit on that half of the capital which had loan status since the loan was interest-free. On the half with trust status, it was considered usurious that the capital-investor should receive all the profit and to avoid this the labor-investor should be paid for his labor.[78] If no payment had been agreed upon, the labor-investor should receive a third of the profit made on the trust half of the capital. With all the profit from the loan half he would receive two thirds of the total profit. He would be liable for one third of all loss "inasmuch as he is liable for one half of the loss as regards half the sum that has the status of a loan, but he is allowed one sixth as compensation for handling the half that has the status of a trust, with the result that one third of the loss devolves upon him, while the investor [of capital] bears two thirds of the loss." This arrangement represented a slight adjustment to the Talmudic principle in favor of the labor-investor.

Other authorities are reported by Maimonides as having taught still further variations and he himself elaborated upon the principle which he preferred.[79]

[74] Translation from Irving A. Agus, *Urban Civilization in pre-Crusade Europe*, 2 vols. (1965; rpt. Leiden, 1968), 1:284–285. Cf. pp. 80–81, 194, for other examples of such division of profit and loss.

[78] An *'isqa* mentioning such payment is referred to in Stephen D. Goitein, "Commercial and Family Partnerships in the Countries of Medieval Islam," *Islamic Studies* 3 (1964), 315–337; here p. 325.

[79] Maimonides's own opinion was as follows: "What appears to me to be the just and right way is that if they agree upon the share of the profits of the trustee and there is a loss, then he should bear a loss corresponding to two thirds of the share he would get in case there were a profit. Thus also if the agreement is made about the loss and they make a profit, then the trustee should take an amount corresponding to the loss he would have to bear in the case of a loss plus one third of the share of the other's profit." *The Code of Maimonides. Book Twelve: The*

Professor Udovitch argued that because the labor-investor always retained some liability for loss of capital in an *'isqa*, the *commenda* could not have evolved from it.[80] His reason for rejecting it as a possible origin of the *commenda* was thus the same as his reason for rejecting the *chreokoinōnia*. In this analysis he neglected the fact that there were in fact two types of *commenda:* the unilateral and the bilateral. At the very beginning of his article he made it clear that he was considering the unilateral *commenda* only; however, he was surely wrong to do so because, as I have shown, the two forms evolved together and were simply varieties of the same contract. In fact, if we do consider the bilateral *commenda* it becomes immediately evident that the division of profit and loss found in the *'isqa* accords very closely with that found in the bilateral *commenda*. According to the Talmudic formulae the labor-investor could be liable for one third of any loss and receive one half of any profit. In the bilateral *commenda* the *tractator* was normally liable for one third of any loss and would receive one half of any profit. What was then the difference between the two? Simply that in the *'isqa* the labor-investor did not have to invest capital in the first instance whereas in the bilateral *commenda* the *tractator* did have to. This difference between investing capital in the first instance and being liable to replace it later does not seem of such significance that it rules out the possibility of influence by the Talmudic *'isqa* on the mathematics of division of profit and loss in the bilateral *commenda*.

Moreover, Maimonides reported that certain of his teachers had taught a division of profit and loss for the *'isqa* which could give results identical to those for the division of profit and loss in the archetypal forms of both the unilateral and bilateral *commenda*.

> My teachers have further held that if the two agree that the trustee should take three quarters of the profit and the investor one quarter, then it makes only one quarter of the sum a trust and three quarters of it a loan. Therefore if there is a loss the trustee bears three quarters of it minus one third of a quarter, while the investor will lose one quarter plus a third of a quarter, which totals one third of the entire loss.
>
> Thus if one gives the other 100 *denar* with that condition and there is a loss of 24, the investor loses eight and the trustee pays back 16.
>
> Such the arrangement should always be: that whatever share of the profits the investor receives is determined by the agreement they have made. But if there is a loss, he bears a corresponding share plus a third of that sum.
>
> Hence if they agree that the trustee take a quarter of the profit and there is a loss, he does not have to pay anything, since over against the quarter of the loss for which he is liable because of the part of the money which has the status of a loan, he has due him a corresponding third of the sum that the investor would bear, which is a quarter of the total sum. The two sums thus cancel each other.[81]

Book of Acquisition 4.6.5 (p. 230). Maimonides's own opinion has no bearing on the discussion since he lived too late to have influenced the development of the *commenda*.

[80] "At the Origins of the Western Commenda," p. 201.

[81] *The Code of Maimonides. Book Twelve: The Book of Acquisition* 4.6.5 (pp. 228–229).

Although the division of profit and loss for the *'isqa* was based upon principles completely foreign to the *commenda*, the mathematical results were the same according to this group of Maimonides's teachers. Applying these principles of liability for loss in the *'isqa* to the division of profit in both archetypal forms of the *commenda*, we obtain the following results:

Unilateral *commenda* — *tractator*'s profit ¼
¼ capital considered as loan
¾ capital considered a trust
Tractator liable for ¼ − (¾ × ⅓) of loss, i.e., no loss
Bilateral *commenda* — *tractator*'s profit ½
½ capital considered as loan
½ capital considered as trust
Tractator liable for ½ − (½ × ⅓) of loss, i.e., ⅓ of loss

These results are the same as the actual liability for loss in the archetypes of both forms of *commenda*. Of course we do not know whether this particular division of profit and loss was common for the *'isqa* in the early Middle Ages when the principles of division for the *commenda* were being developed. To the author's knowledge, no *'isqa* contract or *responsum* records such a division. However, on the basis of Maimonides's authority, it is at least possible that during the formative period of the *commenda* this division was used for the *'isqa* by Jewish merchants. If it was widely regarded as a just and equitable division, it may well have been borrowed by Christian merchants as an archetype for the *commenda*. As is well known, the Jews occupied positions of prestige in the European commercial community at the time and nothing would have been more natural than for the Christians to have borrowed mathematics which gave an equitable division of profit and loss even if the principles upon which the mathematics were based did not apply to their own contract. However, it must be admitted that there is no direct evidence of such a borrowing and the supposition that there was a borrowing is based solely upon the mathematical coincidences. It is equally as possible that the reverse was the case and that this division taught by certain of Maimonides's teachers for the *'isqa* was influenced by current practice in the eleventh and twelfth centuries for the *commenda*.

(5) *Qirād*

The records of the Cairo Geniza, which have been explored by Professor Goitein and his students, contain examples of both the *'isqa* and its Muslim counterpart the *qirād*.[82] It seems that the *qirād* was preferred to the *'isqa* by both Muslim and Jewish merchants in Egypt.[83] The reason for this prefer-

[82] Stephen D. Goitein, *A Mediterranean Society: The Jewish Communities of the Arab World as Portrayed in the Documents of the Cairo Geniza*. Vol. 1: *Economic Foundations* (Berkeley/Los Angeles, 1967), pp. 171, 176–177. See also "Commercial and Family Partnerships," p. 318.

[83] Goitein, "Commercial and Family Partnerships," p. 318.

ence may have been the main difference between the *qirād* and *'isqa:* a difference which was elaborated upon by Maimonides in a *responsum* translated by Udovitch. In a *qirād* the agent, or labor-investor, was liable for no loss of capital as he was in most cases in an *'isqa*.[84] It was this characteristic of the *qirād* which Udovitch seized upon as indicating that the *qirād* was the probable origin of the *commenda*. However, as we have seen, in doing so he neglected the fact that the unilateral and bilateral *commendae* were essentially the same contract. If the *qirād* were to be regarded as probable origin of the *commenda*, it would have to have been able to have influenced the development of the bilateral *commenda* as well as that of the unilateral.

In Muslim law there was a serious objection to the very idea of a bilateral *qirād*. Muslim jurists considered it usurious that the capital-investor should receive a share of the profit made on the part of the capital invested by the labor-investor. They maintained that the capital-investor had no right at all to profit from capital which was not his and which he did not provide labor to work.[85] Consequently, the jurists did not discuss the bilateral *qirād* at all and we have no way of knowing from legal sources what would have been the division of profit and loss in such a *qirād*. However, the practice of commerce was far removed from the niceties of law and the bilateral *qirād* was indeed used in the practice of commerce; the agent or labor-investor being liable for the loss of his capital or for loss proportionate to the share of the total capital which his investment constituted.[86] On the basis of this evidence there was no difference between the liability for loss in both forms of the *qirād* and both forms of the *commenda*. The latter could well have been adapted from the former. There was a difference, however, in the sharing of profit. In the *qirād* any proportional division of profit agreed upon by the partners was acceptable.[87] Whereas all Western legal texts agreed that in the archetypal form of a unilateral *commenda* the profit should be divided in a ratio of ¼ – ¾, Muslim legal texts used numerous divisions: ⅓ – ⅔, ¼ – ¾, ²/₅ – ³/₅, even ¹⁹/₂₀ – ¹/₂₀.[88] Although it is true that individual contracts in the West did specify by agreement between the partners divisions other than the ¼ – ¾ which was the norm, such contracts were very much the exception to the rule for the *commenda*. In the Muslim world there was no such rule for the *qirād*.

[85] Alberto Gaiani, "The Juridical Nature of the Moslem Qiràd," *East and West* 4, part 2 (1953), 81–86; here p. 83: We read indeed in the Mudawwanah that Màlik disapproved of the *qirād* in which both sides contribute to the capital, inasmuch as the capitalist partner can only be entitled to a profit arising from his capital; the prohibition is justified by the usurious character of the profit acquired (*li istighzàr ash-shirà*). See also Udovitch, *Partnership and Profit,* pp. 194–195.

[86] Goitein, *A Mediterranean Society,* 1:176. See also "Commercial and Family Partnerships," pp. 322–325. In a letter to the author Professor Goitein referred to bilateral *qirād* from the Cairo Geniza to be published in his forthcoming book: *Mediterranean People. Letters and Documents from the Cairo Geniza.*

[87] Udovitch, *Partnership and Profit,* pp. 190–196.

[88] Ibid., p. 191.

There were still further differences between the *qirād* and the *commenda:*

1. The *qirād* was most likely "an institution indigenous to the Arabian peninsula which developed in the context of the pre-Islamic Arabian caravan trade."[89] Even in the period of the Cairo Geniza the great majority of *qirād* contracts were used for land commerce.[90] On the other hand the *commenda* was developed and used in the Christian ports of the Mediterranean primarily for maritime commerce. There are some examples of *commendae* used for land commerce, particularly to the fairs of Champagne,[91] but such *commendae* were very much the exception. This difference between the *qirād* and the *commenda* reflected of course a basic difference in the character of Muslim and Christian commerce in the Middle Ages, even when we allow for Muslim maritime commerce in the Indian Ocean.
2. According to Muslim law the capital of a *qirād* could not be comprised of anything but money, that is coinage.[92] Even unminted precious metals were excluded except in those areas where they were circulated as a means of exchange like a currency.[93] In the West, the capital of a *commenda* could be comprised of anything at all: money, precious metals, merchandise, even shares in ships. However, this difference between the *qirād* and the *commenda* need not have been such an obstacle to influence of the former on the latter as it seems. Once again, Muslim commercial practice was far removed from the strictures of law and in the Geniza records there is more than one example of a *qirād* in which the investment was in merchandise.[94] Moreover, even in law a simple device was developed to enable the prohibition against investment in merchandise to be circumvented. An investor could entrust goods to his agent and instruct him to sell them and then use the cash realized from the sale as an investment in a *qirād* at a pre-determined division of the profit.[95]
3. On the question of liability of the capital-investor for obligations entered into on behalf of the *qirād* or *commenda* by the labor-investor, there seems to have been a very marked difference between the two contracts. Normally, the capital-investor of a *qirād* was not liable for obligations entered into by his agent or labor-investor. However, there was one notable exception. If the labor-investor used the *qirād* capital to buy something and then lost that capital before he could pay the seller of that which he was buying, he could have recourse to the capital-investor for an equal amount of capital with

[89] Ibid., p. 172.

[95] Udovitch, *Partnership and Profit,* p. 183.

which to pay for that which he had bought.[96] If the second amount of capital were lost, he could have recourse for a third and so on ad infinitum as long as the capital was lost each time through accidental circumstances for which the labor-investor was not liable. The loss also had to occur after the capital had been pledged for a purchase. If it was lost before, the *qirād* simply lapsed and the labor-investor was responsible for any purchases into which he entered. Such liability on the part of the capital-investor beyond the amount of his initial investment is completely undocumented in the West for the *commenda.* As noted above, there is no evidence one way or the other for such liability in the *commenda.*

The conception of the juridical nature of the *qirād* held by Muslim jurists was very much closer to that of the *commenda* than was the Rabbinic conception of the nature of the *'isqa.* While recognizing that the *qirād* was an autonomous contract, most jurists, particularly those of the Hanafite school, were impressed by the sharing of profit in the *qirād.* They regarded the contract as a partnership with overtones of a hire of labor. Other jurists were even more strongly impressed by this aspect of hire of labor and viewed the *qirād* as a unique contract lying midway between partnership and hire of labor.[97] A few emphasized the aspect of trust or mandate, as Rabbinic law did of the *'isqa,* but none saw any aspect of loan in the *qirād.* In spite of the different points of view of the various schools of law, the majority of jurists viewed the *qirād* as a partnership because of the sharing of profit[98] and because of the amalgamation of the twin resources of labor and capital. As the eleventh-century jurist Sarakhsi said, the *qirād* was permissible:

> Because people have a need for this contract. For the owner of capital may not find his way to profitable trading activity, and the person who can find his way to such activity may not have the capital. And profit cannot be attained except by means of both of these, that is, capital and trading activity. By permitting this contract, the goal of both parties is attained.[99]

Such an eminently practical comment could well have been written of the *commenda,* so similar was it to the *qirād.* Of the three contracts which

[96] Ibid., pp. 238–242.

[97] Gaiani, "Juridical Nature of the Qiràd," p. 84. The *qirād* became hire of labor if the labor-investor was given a fixed return in place of a share of the profit. See ibid., p. 82; and Udovitch, *Partnership and Profit,* p. 191. The same was true of the *societas* of labor and capital. See Petrus de Ubaldis, *Tractatvs de dvobvs fratribvs,* 4.6 (fol. 34v): "Sed primo quaero, quid si non apparet contracta societas, sed ponens operas tantum, uult aliquid certum pro opera sua, et non teneri ad damnum. Dic, quod tale pactum seu conuentio ualebat nec erit contractus societatis set locationis operarum." Cf. Joannes Andreae, *Ioannis Andreae . . . In Primum (– Sextum) Decretalium librum Nouella Commentaria,* 5 vols. (1581; rpt. Turin, 1963), 5.De vsuris.19 (vol. 5, p. 77A); and Bernardino of Siena, *Opera Omnia,* 9 vols. (Ad Claras Aquas Florentiae, 1950–65), vol. 4, sermo 39, art. 2, c. 3 (p. 283).

[98] Udovitch, *Partnership and Profit,* p. 196.

[99] Al-Sarakhsī, *Al-Mabsūt,* 30 vols. (Cairo, 1906–1912), 22:19. Translated in Udovitch, *Partnership and Profit,* p. 175.

Udovitch examined, the *qirād* was undoubtedly more similar to the *commenda* than were the *chreokoinōnia* and the *'isqa*. Even taking into account the qualifications which have been made about the nature of the *chreokoinōnia* and the *'isqa* and the differences which have been pointed out between the *qirād* and *commenda*, it still remains true that the economic structure of the *qirād* was extraordinarily similar to that of the *commenda*. Moreover, there were certain peculiar similarities which were so striking as to suggest strongly some degree of exchange of ideas between the two contracts.

1. Transfer of control over the capital in question was an absolute prerequisite for both the *qirād* and the *commenda*. In a *qirād* the money had either to be physically handed over to the labor-investor; or, in cases in which the money was not on hand, authority over its control had to be given to him.[100] There could be no effective *qirād* until the capital was in the agent's possession.[101] Exactly the same was true of the *commenda*. The *Constitutum Usus* of Pisa showed that it was essential for a *tractator* to take possession of the *commenda* capital before he incurred any obligation. Barring a special agreement to the contrary, when capital promised by a *commendator* was located at some place other than that where the contract was made, the capital was not considered to become a part of the *commenda* until the *tractator* took possession of it.[102] On the other hand, once the *tractator* had taken possession of the capital in question he could be compelled to fulfill the obligations to which he had assented.[103]

2. In both *qirād* and *commenda* the ownership of the capital remained with the capital-investor although the labor-investor had absolute control over it. In a *qirād* anything which the labor-investor acquired with the *qirād* capital belonged to the capital-investor except for profit or increase in value, in which the labor-investor acquired ownership proportionate to his specified share of profit.[104] In the West, the statutes of Dubrovnik, Toulouse, and the

[104] Udovitch, *Partnership and Profit*, pp. 190, 224, quoting Shaybānī, *Aṣl, Muḍāraba*: "For anything he acquires with *commenda* [*qirād*] capital belongs to the investor, except if an increase

Kingdom of Jerusalem referred to the *commendator* as the *dominus* or *sire* of the *commenda* capital.[105] Moreover, in his discussion of the *societas* of labor and capital St. Thomas Aquinas differentiated between the illicit *nauticum fenus* and the *societas* of labor and capital on the grounds that in the latter ownership of the capital remained with the capital-investor.[106] In a bilateral *societas* of labor and capital, or a bilateral *commenda*, the labor-investor would have retained the ownership of that part of the capital which he invested. There is no reference in the West to the ownership of the profit of a *commenda* but there seems no reason to suppose that the principle which Muslim jurists applied to the *qirād* would not have been applicable to the *commenda*.

3. In both the *qirād* and the *commenda* there were two types of arrangements with respect to the labor-investor's freedom to manage the enterprise. There were two types of *qirād:* a *qirād* with limited mandate and a *qirād* with unlimited mandate.[107] An unlimited mandate was conveyed by the capital-investor's statement to the labor-investor: "act with it [the capital] as you see fit." Such a mandate allowed the labor-investor complete latitude in his management of the enterprise. When the labor-investor was not given such an unlimited mandate, his freedom of action was somewhat restricted, especially with respect to third parties. He could not combine the *qirād* capital with other property in his possession; he could not invest it in a *qirād* with a third party; and he could not invest it in an ordinary partnership (*mufawada*) with a third party. These restrictions were paralleled in the West *vis-à-vis* the *commenda*. Under normal circumstances a *tractator* was not permitted to combine *commenda* capital with other property in his possession[108] and was not permitted to invest it in a *commenda* with a third party.[109] I have found no examples of *commenda* contracts which gave the *tractator* permission to invest the capital in a *commenda* with a third party but there are certainly

---

in value occurs, in which case the agent acquires a share in the ownership of the increase commensurate to his share of the profit."

[105] Dubrovnik, *Liber statutorum Ragusii* 7.50 (p. 167): "Et de lucro quod habebit dominus denariorum vel mercium, debet habere duas partes, et ipse [*tractator*] habebit terciam." Toulouse, *Consuetudines Tholose* 72 (p. 110): ". . . sin autem dominus mercandarie debet illud de suo proprio solvere, dum tamen supra dictus recipiens fidem dederit rationabilem dicto domino mercandarie predicte. . . ." Kingdom of Jerusalem, *Assises de la Cour des Bourgeois* 44 (p. 43): "Et c'il avient qu'il gaaignast en celui veage, si deit aver sa part le sire de l'aver, par dreit et par l'asize."

[106] St. Thomas Aquinas, *Summa Theologiae. II^a, II^{ae}.*, 78.2, ad obj. 5: "AD QUINTUM DICENDUM quod ille qui mutuat pecuniam transfert dominium pecuniae in eum cui mutuat. Unde ille cui pecunia mutuatur sub suo periculo tenet eam, et tenetur integre restituere. Unde non debet amplius exigere ille qui mutuavit. Sed ille qui committit pecuniam suam vel mercatori vel artifici per modum societatis cuiusdam, non transfert dominium pecuniae suae in illum, sed remanet eius, ita quod cum periculo ipsius mercator de ea negotiatur vel artifex operatur. Et ideo licite potest partem lucri inde provenientis expetere, tanquam de re sua."

many which gave him permission to combine it with other property in his possession.[110] Moreover, there were *commenda* contracts which gave the *tractator* permission to treat the *commenda* capital as part of his own property in a parallel fashion to the unlimited mandate in the *qirād*.[111] Municipal statutes confirm that clauses to this effect in *commenda* contracts nullified certain restrictions which the statutes themselves placed upon the freedom of action of the *tractator*.[112]

4. With respect to the mechanics of how the division of proceeds was actually accomplished, the *qirād* and *commenda* paralleled one another. In the *qirād* return of the proceeds to the capital-investor was essential. As Udovitch says: ". . . there is a kind of symmetry at both temporal poles of the contract. Just as the *commenda* [*qirād*] could not begin without the investor relinquishing control over his capital and handing it over to the agent, so too, did its conclusion depend on the agent's restoring it in full to the physical possession of the investor."[113] The profit was returned and divided at the same time as the capital was returned. In the West, it was mandatory upon the *tractator* to return into the physical possession of the *commendator* the entire capital and proceeds of the *commenda* as they were shipped back on his return voyage to his home port.[114] Unless he was given permission to do so by the *commendator,* the *tractator* could retain nothing in his own posses-

[110] The *tractator* could declare the other property and undertake to do business with it together with the *commenda*. See *Giovanni Scriba,* no. 121: "Ultra has portat lb. .ccccxxiiii. d. .xxxii. quas Wuilielmus Filardus dicit esse Ansaldini nepoti sui et . . . De his omnibus expensas debet facere per libram et de lucro quod Deus in eis dederit debet habere quartam partem." Cf. ibid., nos. 137, 141, 214, etc.; *Guglielmo Cassinese (1190–1192),* nos. 143, 235, 1011, etc.; and *Bonvillano (1198),* nos. 2, 3, 17, 102, 116, 135, etc. Alternatively, the *tractator* could declare that the *commenda* would be amalgamated with whatever other property he had in his possession and business done with the entire amalgamated capital as a unit. Marseilles — Blancard, *Documents inédits,* 1 (*Les chartes commerciales des Manduel*), no. 108: ". . . ego Guiraudus Medicus confiteor et recognosco tibi Johanni de Mandolio me habuisse et recepisse a te in commanda C l. monete miscle curribilis in Massilia, implicatas comuniter in meis implicitis. . . ." Cf. ibid., 1, nos. 106, 114, 115; ibid., 2 (*Les notules commerciales d'Amalric*), nos. 4, 8, 9, 25, 34, 44, 47, 61, 62, 65, etc. Genoa — *Giovanni Scriba,* no. 270; *Guglielmo Cassinese (1190–1192),* nos. 175, 181, 956, 1046, 1065, etc.: *Bonvillano (1198),* no. 97. [113] Udovitch, *Partnership and Profit,* p. 246.

[114] Marseilles, *Statuts de Marseille* 3.23.1 (pp. 134–135): "Generaliter decernimus ut quilibet socius vel commendatarius qui ab alio res aliquas nomine societatis vel commande portaverit vel portabit in aliquod viagium, cum inde redierit, dictam societatem vel commandam sive implicitas inde habitas vel redactas in potestate capitanei sui, illius scilicet qui res in societate vel commanda eidem tradidit, si ipse capitaneus vel ejus successor hoc volet vel postulabit ab illo fieri, ponat et assignet sine mora." Cf. ibid., 6.19.1 (p. 200); Pisa, *Constitutum Usus* XXII.16 (p. 890); Barcelona, *Consolat del Mar* 175 (p. 332).

sion.[115] Restoration of the capital to the investing partner or partners and division of profit or assignment of loss was then worked out on the spot between the two partners.

The four points discussed above were by no means the only points of close similarity between the *commenda* and *qirād*. However, these four were isolated because they illustrate peculiar and specific characteristics of the two contracts which lead to the suspicion that there was some degree of influence by either one of the two contracts upon the other. In which direction that influence moved is impossible to say although, because the Muslim legal sources upon which much of our knowledge of the *qirād* is based predate the earliest references in the West to the *commenda*, the influence would probably have been from Islam to Christianity rather than vice-versa.

Conclusions

There is direct evidence of influence on the *commenda* by the *chreokoinōnia* only, although both the *'isqa* and *qirād* displayed certain characteristics which strikingly paralleled those of the *commenda* and which strongly suggest influence. The *nauticum fenus* can be eliminated from consideration as being too far removed in both economic structure and juridical conception to have influenced the evolution of the *commenda*. Besides, it survived itself into the Middle Ages.

There remains the question of to what degree each of the *societas* of labor and capital, the *chreokoinōnia*, the *'isqa*, and the *qirād* was likely to have influenced the development of the *commenda*? If we consider their similarities and differences, the following points emerge. *Qirād* and *commenda* were most alike in the matter of liability for loss. The *chreokoinōnia* made liability for loss dependent upon agreement and therefore, no evidence to the contrary being available, it may have been possible for all loss of capital to have been assigned to the capital-investor. For the *'isqa*, some Rabbinic authorities taught that the labor-investor should be liable for a share of the loss equal to his share of the profit minus a third of the capital-investor's share of the profit. This gave mathematical results identical to those used for the archetypal forms of the *commenda*. In the matter of division of profit, the *qirād* and *chreokoinōnia* differed from the *'isqa* and *commenda* in having no norm and allowing a free division according to agreement between the parties. The *societas* of labor and capital differed from the *commenda* in that it allowed a capital-investor to take only a half of the profit when the labor-investor was not liable for any loss of capital.

[115] Marseilles, *Statuts de Marseille* 6.19.1 (p. 200). In commercial practice it was normal for *commenda* contracts to specify that the entire capital and proceeds would be returned to the commendator for division. Contracts which specified that the *tractator* could deduct his share of the profit before restoring the capital and *commendator's* share of the profit were the exception to the rule, although they did occur. Dubrovnik — Čremošnik, *Spisi Dubrovačke Kancelarije*, no. 785: "Et de lucro quod Deus dederit de dictis solidis debeo habere medietatem et dicto Petro

From the point of view of their juridical natures, all five contracts were unique, *sui generis,* within their respective legal systems.[116] Therefore, the types of contracts with which they were most closely identified best indicate the conceptions of them held by their respective societies. Here the *'isqa* stands alone. Whereas the *societas* of labor and capital, the *chreokoinōnia,* the *qirād,* and the *commenda* were all regarded as types of partnership, the *'isqa* was regarded as a combination of trust and loan.

The medieval identification of the *commenda* with the *societas* of labor and capital makes it very probable that ultimately the origins of the *commenda* stretched back to the Roman contract, even if the process by which they did so cannot be traced at present. We should bear in mind that the *commenda* first appeared in those areas where the traditions of Roman Law had survived most strongly: Liguria, Lombardy, Tuscany, and Venetia. Moreover, knowledge of the *Digest* would not have been necessary for someone to have known of the *societas* of labor and capital. It was mentioned in both the *Codex* and the *Institutes* and is in fact described in the Provençal *Lo Codi* which predates the rediscovery of the *Digest.* It seems reasonable that a Byzantine institution such as the *chreokoinōnia* might have been the connecting link between the *societas* of labor and capital and the *commenda.* In particular, it might have been the means by which the *societas* became applied to maritime commerce and thus took over part of the role filled by the *nauticum fenus* in Roman times.

However, although the sources for the idea of a *commenda* contract may reach back to the *societas* of labor and capital and the *chreokoinōnia,* there is no doubt that those sources were amalgamated and forged into a coherent institution in the commercial community of the early Middle Ages. In this community the Jews held an important if not dominant position.[117] The particular division of profit and loss adopted as the norm for the *commenda* must surely have been influenced by that used by the Jews for the *'isqa.*

Finally, the similarities both in economic structure and juridical conception between the *qirād* and *commenda* were far too striking for us not to admit that the *qirād* must have added its influence in those areas of parallelism. The medieval commercial community was characterized by its outward-looking aspect and its willingness to receive and utilize ideas from any source whatsoever as long as those ideas could be turned to making a profit; in short by its eclecticism. In developing the *commenda,* all available sources were utilized and the best characteristics from each combined to forge the highly utilitarian commercial institution that was the *commenda.*

COMMERCIAL ACTIVITY IN SARGONIC MESOPOTAMIA

By BENJAMIN R. FOSTER

Records of commercial activity from Sargonic Mesopotamia offer a wealth of evidence to the student of ancient trade and business. In view of the richness of the documentation and the dearth of studies dealing with it, a broad survey of the problems and evidence seems called for in preference to a detailed study of a particular issue or group of texts.[1] Questions that such a survey confronts are the nature and purpose of commerce in Sargonic Mesopotamia; who the people were who engaged in it and why; what the sources of their capital were; what commodities they dealt in, where and why; how their business was conducted, and what sort of records they kept. Documents and letters from various sites provide answers to some of these questions, even if they raise other problems of their own. This essay considers each of these questions in turn and the evidence the texts provide that helps to answer them.

Commerce in the Sargonic period is best defined by recourse to contemporaneous terminology: šám, that is, buying and selling of commodities.[2] The purpose of this commerce was two-fold: to make a profit and to acquire goods not available locally in Mesopotamia. Most of the available documents are records of business transactions of a profitable sort. Of these two possible motives for commerce: personal or institutional profit and the necessity of importing foreign commodities, the profit motive was probably the more important in the Sargonic period. Evidence for this hypothesis will be offered below.

The question of who engaged in this commercial activity is complicated by uncertainty about the role of the state in Mesopotamian commerce of the third millennium B.C. Several theories, which differ in detail, emphasize the importance of the crown in economic activity of third millennium Mesopotamia. These theories, most of which may be grouped under the rubric "state socialism," assign to the state dominance or even monopoly of various means of production and exchange, especially in the Sargonic and Ur III periods.[3] The evidence however yields a

[1] No previous study of this subject is known to me. Background information can be found in M. E. L. Mallowan, "The Mechanics of Trade in Western Asia" (*Iran* 3 (1965), 1–7); A. L. Oppenheim, "Trade in the Ancient Near East" (*V International Congress of Economic History* (Moscow, 1970), 1–37); G. Pettinato, "Il commercio con l'estero della Mesopotamia Meridionale nel 3. millennio av. Cr." (*Mesopotamia* 7 (1972), 43–166); H. E. W. Crawford, "Mesopotamia's Invisible Exports in the Third Millennium" (*World Archaeology* 5 (1973), 232–241); Philip L. Kohl, "Carved Chlorite Vessels: a Trade in Finished Commodities in the mid-Third Millennium" (*Expedition* 18 (1975), 18–31). Note for example that the Sargonic period is not referred to in Leemans' brief sketch of the pre-Old Babylonian merchant, *SD* III, 40 ff. The text references cited below are illustrative only and are not intended to be exhaustive.

[2] For discussion of this word and its graphic representations, see J. Krecher, *ZA* 63 (1974), 151 ff.

[3] For the concept of state socialism, see I. J. Gelb, *Studi in Onore di Edouardo Volterra* (Rome, 1969), 1:146 f., 153; V. V. Struve, *VDI* 1948 No. 2, 22 ff. Additional literature on this question may be found in B. Foster, *Umma in the Sargonic Period* (forthcoming), Chapter I note 12; and M. Rostovtzeff, *The Social and Economic History of the Hellenistic World* (Oxford, 1967), 3:1327 note 25.

somewhat different picture. While state establishments were indeed active in commerce and enjoyed the advantage of large resources, individuals, sometimes on their own, sometimes through these same state establishments, participated in profitable business enterprises.[4]

To consider first private businessmen, one must distinguish between those who operated entirely on their own with their own resources and those who took advantage of lucrative opportunities that state service provided. One means of identifying such people is to see what sort of records they kept. Some private businessmen kept personal accounts. These were characterized by use of the vernacular and absence of the formal administrative terminology used by the state bureaucracy; a handwriting and tablet form often less refined than those of official records; and use of the first person rather than the third or impersonal usage favoured in official records. Documents that may plausibly be interpreted as records of this type include the archive of Quradum, a businessman perhaps at home in Sippar.[5] In one letter he went into partnership with a man who put up money for a slave whom Quradum agreed in turn to support for six years.[6] In another record he noted that he had paid out money to buy a certain slave, but had not received the slave by the time he drew up his accounts.[7] Some idea of the extent of his dealings can be gleaned from his summary account of copper, silver, livestock, oils, garments, and fruits in Tutul, Mari, and URU.SAG.RIG$_7$.[8] To judge from another record, he kept accounts with over a dozen people.[9]

The archive of a certain Ginunu, who was active at an unknown site in the Diyala, may also be the records of a man doing business on his own, though it is possible he held some official post.[10] He dealt mostly in grain and silver,[11] and was party to several legal transactions.[12] An associate of his, a certain Šunitum, is named in a variety of texts having to do with distribution of barley and foodstuffs.[13] Most of these appear to be records of commercial transactions, one a crudely written text in the first person.[14] The most splendid document in this group is a large, four-column account of foods, implements, lumber, and other goods priced in gold.[15]

At Umma a certain Ama-é, wife of Ur-Šara, was an enterprising business woman. Ur-Šara was one of a small group of men who contracted to raise state livestock and make regular deliveries of animals and hides to the owner.[16] Neither he nor his wife

[4] Diakonoff, who generally stresses the importance of the temple and state households in commerce before the Old Babylonian period, seems to grant this point, *VDI* 1968 No. 4, 9. State control of trade is often posited for the Ur III period, e.g. by Hallo, *JCS* 17 (1963), 60.

[5] First identified by Sollberger, *CT* 50, 8.

held any state office. Ama-é received extensive land allotments from the state, probably on a rental or other contractual basis, and dealt in real estate, metal, and grain.[17] She invested her wealth with various agents. To one man she entrusted foods, aromatics, and wood, probably as an investment,[18] and to another silver.[19] Through another man she bought and sold wool in large quantities.[20] One may suppose that she outlived her husband and assumed his responsibilities at his death.[21] There is no reason to believe her career was exceptional, as women appear in other Sargonic commercial texts.[22]

Some people who held state offices took advantage of their positions to engage in commercial activities on their own behalf. Some of these were people who did not trade themselves, but entrusted commodities to official trading agents who traded for them. At Umma during the reign of Šar-kali-šarri a certain Ur-Ninildum, a granary officer, deposited 50 *gur* of emmer into a fund called the " Fund of the Balanced Account." [23] The nature of this fund is discussed more fully below, in consideration of the sources of capital. This fund was used by a state business agent, a certain Abbamu, and contributors to it were presumably reimbursed in proportion to their contributions. Another record for this same agent has entries on behalf of a cook and a royal carpenter.[24] In a similar record a cadaster officer and a food officer contributed dates, priced in silver, to an unnamed fund that was probably a merchant's fund of this same type.[25] Many texts which record deposits of silver or other valuables with others may in fact be records of investments with an agent rather than deposits for safe-keeping.[26]

Other state officers were very active in business on their own behalf, and even kept the records in their offices rather than at their homes. An example of this is the activity of a certain Zu-zu, a cadaster official at Gasur. He appears in various loans and debts of fats, barley, livestock, and silver, records of which were found with other records that appear to be of an official nature.[27]

The sources of these people's capital must in each case have been their own resources, which they built up through buying and selling, emoluments, and speculation. While many isolated records of this kind of activity occur, they are difficult to interpret as they normally give no hint as to the nature of the transaction they record.

The professional business agent was called dam-gàr.[28] There is no reason to

assert that the dam-gàr was solely a state agent. Dam-gàr's do not appear in the types of ration lists that enumerate the domestic or executive staff of Sargonic state households.[29] Some of these men did work for the state, and occasionally received grain and animals from the state household, perhaps for food or personal use.[30] As with other professions, their personal status varied widely; thus being a trading agent was no guarantee of social position. Some agents had one or more servants or slaves, and had school training.[31] On the other hand they or their sons could be state dependents,[32] or at least liable for menial labour service.[33] Some made gifts and offerings of metal and animals that suggest they were wealthy.[34] That there was some sort of organization for dam-gàr's is suggested by the occasional mention of a "chief trading agent" (dam-gàr-gal).[35]

The outside sources of the dam-gàr's capital included the fund of goods put at his disposal by private parties or the state. At Umma this fund was called the "Fund of the Balanced Account." The largest contributor to this fund was the state household, through the agency of the šabra, or household intendant.[36] This fund consisted mostly of grain, silver, or foodstuffs, all of which were widely used in commerce. Some of the cash in this fund seems to have come from rentals of land. Two texts from Umma suggest that cash rentals from lands leased by the state to individuals were payable in silver, grain, and livestock.[37] Some of the proceeds from these rentals were put directly into this fund of the balanced account. Barley put into the fund was recorded by entering the field from which it came and the name of the lessee of the field, while silver was recorded by entering the name of the officer apparently responsible for collecting it from the lessee. The advantage of this arrangement was that if the lessees deposited silver or grain on their own accounts their deposits could not be confused with what they had paid the state as rent.

Another type of commercial agent was the ga-raš or gaeš.[38] He is mentioned in deliveries of commodities to the state.[39] On this basis it may be proposed he was a purchasing agent who acquired commodities the state needed, while the dam-gàr was a business agent who sought profits in cash or commodities for his clients. In one

case the ga-raš' capital was copper provided by the ensi, or head of the local state administration.[40] The garaš, unlike the dam-gàr, may have been a regular member of the household staff.[41]

Besides using the services of business agents, the great state households conducted business on their own account. The archive of a Sargonic state establishment that was located somewhere near Umma, perhaps at the city or to the south of it, provides evidence for this sort of activity.[42] This establishment was not very large, perhaps about 0·4 square miles of arable land, with a work force of less than a hundred,[43] but one of its members, a certain Me-ság, undertook a great variety of commercial missions to Agade, A.HA, Lagaš, and other cities.[44] He was certainly a member of the state establishment, as he held allotments within the household, but was never given a title.[45] The records of his activity are of the usual official types, but are written for the most part in Akkadian, in contrast to the state records of Umma, which are in Sumerian.

Many commodities changed hands in this commerce, but the two basic commodities of exchange were silver and grain. The two could be used interchangeably, and silver may be considered money in the usual sense of that word. Silver served as a unit of value; therefore commodities were often priced in silver for the purposes of commercial record-keeping.[46] Silver also served as a medium of exchange.[47] When an official household for example needed to buy commodities, silver could be used.[48] Silver could also be bought and sold like any other commodity,[49] and appears in inventories of goods that were probably commercial in nature.[50] Silver was widely used in personal loans,[51] and was often to be found in the possession of both private citizens and officials.[52] A businessman might have silver on deposit at various places; for example a man at Ešnunna had silver on account at Uruk and a place called ŠUBUR.[53] Silver could also be used by individuals or the state in pur-

[40] *ITT* I 1422, a quantity of copper delivered to the é-gal nam ga-raš-ak [x?] Má-gan.

[41] *OIP* 14 150, disbursement of foods to the staff of a Sargonic state houshold at Adab, including a garaš; *Nik* II 41, issue of flour to a garaš (line 2 = Šeš-tur ga-raš [coll. M. Powell]).

[42] Many texts in *BIN* 8, others unpublished. I hope to treat this archive in detail elsewhere.

[43] Calculated from its monthly summary rosters, e.g., *BIN* 8 122, 123.

[44] *BIN* 8 129, 137, 146, 165, 263.

[45] *BIN* 8 188, 192, 194, 196, 203.

[46] E.g. *BIN* 8 213, 392; *OIP* 14 160. Note that wool could be measured by the "silver weight", (NA$_4$ KÙ.BABBAR), *OAIC* 36.

[47] *BIN* 8 168, 175 (account of silver mentioning dam-gàr's); *MAD* 1 43 (purchase of animals, slaves, etc.).

[48] *BIN* 8 180, official disbursements (kù zi-ga) of silver for slaves, dates, etc.; cf. *MAD* 1 25 (purchase?); *MAD* 5 17 (grain sold for silver to dam-gàr); *MAD* 1 328 (oil and barley for silver).

[49] *BIN* 8 174; *MAD* 1 208.

[50] E.g. *MAD* 1 171 (list of wool, grain, livestock, garments, silver); *MAD* 1 302, 303, 304 (aromatics, eggs, silver). For possible purposes of such inventories, see below.

[51] *HSS* 10 110; *MAD* 5 30, 86, and many others.

[52] *MAD* 1 34, 125, 208, 302, 303; *MAD* 4 124; *MAD* 5 84, 88, 102, 108; *MVN* 3 81, 98; *BIN* 8 168; *OAIC* 35–37. Note for example *MAD* 5 102, where a group of people is described as *bēlū* KÙ.BABBAR, "owners of (the) silver"; and *BIN* 8 167, where silver changes hands at the conclusion of a case at law. It was also customary to give silver to the judge and the maškim of court proceedings, perhaps as "court costs", cf. *MAD* 1 228, 242. For silver in hands of officials, cf. *Nik* II 56; *OIP* 14 197; *ITT* I 1070. For silver going from an official to a private person, see *MDP* 14 19, in which the ensi of Umma pays a woman silver in lieu of her income from a land allotment. *MAD* 5 9 seems to be a payment in grain or silver to soldiers on a campaign (?) in Gutium (?).

[53] *MAD* 1 32, 166; cf. the archive of Quradum, above, notes 4–7.

chasing real estate [54] or in paying rentals.[55] Silver was sometimes offered to the gods or to the royal family either to meet obligations or as a free-will offering.[56]

Grain appears as an item of commerce in many of the transactions noted above in connection with silver. Like silver, grain could be used for buying and selling,[57] renting,[58] could be loaned at interest or interest free,[59] and could be exchanged for other commodities.[60] As grain was the staple of the Mesopotamian economy, commercial transactions with grain are often hard to distinguish from the many other types of records that deal with it. Was certain grain shipped from Girsu to Agade for example a commercial venture, payment of taxes, or for some other purpose? [61] Other foods like dates or flour appear in commercial records as media of exchange.[62] Many city dwellers, if they did not own, rent, or hold allotments of agricultural land, presumably had to purchase some of these foods on the open market (sila).[63] Oils and fats were important items of commerce,[64] as well as aromatics and extracts of various trees,[65] different kinds of wood,[66] garments, and textiles.[67]

Livestock was another important commodity. Donkeys and asses of various kinds were bought and sold,[68] and perhaps used by merchants for transporting goods overland.[69] Cows, oxen, and pigs were also bought and sold.[70] There are records of large herds of livestock, especially sheep and goats, being moved from city to city. Many of these may have been for commercial enterprises. For example cattle and sheep were shipped through Agade,[71] over 3,500 sheep and goats were sent from Umma to Girsu,[72] and other sheep and goats were sent from Umma to Uruk.[73] It is difficult to see any other reason for this transport of animals than a commercial one, and one text indeed indicates sheep that were sold in Nippur.[74] Records were kept

[54] Private treaties: *MAD* 5 82; *MDP* 14 4 (sales of houses); *MAD* 1 168 (sale of a field); official transactions: Obelisk of Maništusu (Scheil, *MDP* 2, 1 ff.); Sippar Stone (Gelb, *RSO* 32 (1957), 83 ff.).

[55] *BIN* 8 282 (rental of a garden); *OIP* 14 78, 114 (rentals of fields); cf. *ITT* I 1042, below, note 68.

[56] *OIP* 14 111, 159: máš-da-ri-a offerings of silver by a dam-gàr. This silver must have been his own, as he could hardly have offered state property to a deity in his own name.

[57] *MVN* 3 60 (barley to dam-gàr's); cf. *MVN* 3 25; *MVN* 3 80 (grain used to buy silver to purchase a slave); *MVN* 3 81; *MAD* 5 88.

[58] See above, note 55.

[59] *MAD* 1 17, 105 (?), 110, 148 (records of interest); 275, 321; *MAD* 5 74, 77, 78; *OAIC* 32 (with loan of a lamb).

[60] *MAD* 5 88, barley and silver; *MAD* 5 3, silver and barley used to buy a house. For silver valued in grain (še-bi), cf. *OIP* 14 168.

[61] *ITT* I 1075, 1076; cf. *MAD* 1 18 (barley to a dam-gàr).

[62] *MVN* 3 62; *BIN* 8 175.

[63] For the market, see below. The Leningrad "Larsa Project" has concluded that the city dwellers in the OB period purchased some food for cash, I. M. Diakonoff, *Drevnij Vostok, Goroda i Torgovlja* (Yerevan, 1973), 47 f.

[64] *MAD* 1 279, 300, 328.

[65] *MAD* 1 291 (loan), 304 (?); 37 and 300 (sales of aromatics).

of animals that were removed from city limits, just like other goods.[75] Of course not all movements of animals were for commerce. Some were taken for slaughter,[76] for example, or for delivery to cult sites.[77]

The slave trade seems to have been a particularly profitable undertaking in Sargonic Mesopotamia. While Diakonoff,[78] Gelb,[79] and Tyumenev[80] have emphasized that chattel slaves were not a significant productive labour force in third-millennium Mesopotamia, it is clear they were a luxury for which there was a ready market. Slaves appear in many merchants' accounts along with other commodities, or in separate transactions, with or without witnesses.[81] The great majority of them have Mesopotamian names and even patronymics, so there is no reason to believe they were mostly imported from abroad as in later periods.

While some business agents may have specialized in one or another commodity, inventories of merchants' stocks usually contain a variety of goods. For example the balanced account of goods put at the disposal of a certain Sikkur by the intendant of the state household at Umma included silver, garments, wool, and oil, the whole worth nearly 12 minas of silver.[82]

It is suggestive to consider what commodities are not found in commercial texts as well as those that are. Strikingly absent are the very products one might most expect to find there if one believed that the role of the trading agent was to acquire goods not available locally in Mesopotamia. One searches in vain for accounts of steatite, chlorite, lapis, or other precious and semi-precious stones and their imitations. There seem to be no records of bulk acquisition of copper or silver, but only records of transactions and stocks on hand, sometimes very large and often in the hands of private people.[83] While shipments of wood do occur in the records, these are in small quantities and seem to be private enterprise on a modest scale.[84] There is in short no evidence in the available records that the Sargonic dam-gàr played any significant role in the acquisition of products foreign to Mesopotamia, or was anyone other than a businessman who sought profits for clients, including the state, in Mesopotamian markets with mostly Mesopotamian goods. If the majority of foreign imports such as precious stones were acquired in a way that has left no record in the official and private archives of Mesopotamian urban centres, one must assume they were either not accountable property, or became accountable property at a

[75] *OIP* 14 124; *ITT* 2978 (animals uru-ta è-a). Cf. below, note 120.

point beyond the horizon of these archives.[85] Gems and rare metals may not have been for the most part accountable property of the state, but private property of the king or other wealthy individuals. This property would appear in records only if it was entrusted to craftsmen for working, and such records are known, especially from later periods.[86] These goods represent foreign gifts, tribute, or booty accessible to the ruling establishment but not found in state inventories.[87] As for commodities such as copper that were accountable but were not produced locally, and for which no records of acquisition are available, one can conclude only that they were acquired by the state by means or agents as yet unknown.[88] One seeks in vain among the thousands of preserved Sargonic records for an example of agents acquiring such goods for the state.

The comings and goings of commercial parties within Mesopotamia are well documented. An early Sargonic ship manifest consists of a list of men with hired attendants called "hired men of the dam-gàr's".[89] Hired men are seldom encountered in Sargonic texts, so it is not straining the evidence to see in this manifest the embarkation of a commercial party. As water travel was the most important means of transportation, at least in southern Mesopotamia, one would expect the majority of commercial goods to go by boat. There are in fact ship manifests that contain such a varied cargo that here too commercial enterprise seems the best explanation for them. A single such shipment includes jars of oil, animal hides, brewing ingredients, legumes, spices, sea fish, fatted animals, barley, and flour, under the charge of a slave or a servant of an untitled person.[90] The grain and flour are measured with the standard metrology one often finds in commercial texts.[91]

There is not yet sufficient evidence to reconstruct the patterns of commercial connections between the various Mesopotamian cities. One may suggest that both geographical position and regional specialities have to be considered. Gasur was perhaps a centre for swine-herding and lard production;[92] Lagaš was certainly a centre for fishing, both fresh and salt water;[93] Umma may have been a centre for

[85] A post-Sargonic text edited by H. Sauren, *AIPHOS* 20 (1968), 388 f., under the title "Une Caravane sumérienne" contributes nothing in this respect. Sauren's interpretation of it depends on an antiquity dealer's unreliable assertion that the tablet was found in Luristan, and an emendation of the document (p. 392) to include a non-existent lugal kaskal(a). Kaskal is a category of personnel; cf. *Nik* II 14 iii.1.

[86] See for example *ECTJ* 51; for later periods *UET* III 757, 761, 768, 776, 1498 (Ur III); *Sumer* 9 (1953), 21 ff. (Kassite period); *ITT* V 9276, which mentions rare stones, is unfortunately badly broken.

[87] This way of acquiring foreign goods is well documented in the Amarna letters (D. O. Edzard, *JESHO* 3 (1960), 38 ff.) and is still found in the records of the Neo-Assyrian kings, who distinguish between tribute (*biltu, mandattu*) and "gifts" to the king (*namurātu, kadrû*); cf. *OIP* 2 33.iii.36 (Sennacherib); and for *namurātu*, Golovleva, *VDI* 1975 No. 3, 3 ff.

[88] Importation of building stone, for example, was a royal undertaking impracticable commercially. Thus Maništusu caused stone to be brought from Iran, but one finds no archival records of such stone (H. Hirsch, *AfO* 20 (1963), 69 f.). Gold is exchanged for silver in *ITT* V 9277; for a merchant's account of copper and bronze, cf. *RTC* 100.

[89] *Nik* II 19, cf. ii. 12: lú-hun-gá dam-gàr-ne; cf. *ITT* II 2915, another passenger list.

[90] *BIN* 8 267, 276, 280; cf. *RTC* 102; *ITT* V 9296(?).

[91] For the metrology of commercial texts, see below.

[92] *HSS* 10 177, 181 (accounts of swine); *HSS* 10 168, 169, large shipments of ì-šah to Assur, Agade.

[93] There are over a hundred published Lagaš texts recording fish, often in enormous quantities (e.g., *RTC* 129, nearly 60,000). For drying and salting of fish at Sargonic Lagaš and Uruk, see Crawford, "Invisible Exports", 233 f.

production of aromatic oils,[94] and appears to have exported large numbers of sheep and goats.[95] Apparent commercial contacts between Uruk and Ešnunna,[96] Uruk and Umma,[97] Girsu and Umma,[98] and Ešnunna and Gutium [99] can be documented, both of a private and commercial nature. Quradum, a private business man apparently residing in Sippar, had business as far off as Mari and Tutul on the Euphrates.[100]

Commercial contacts of Mesopotamian cities with points outside of Mesopotamia are best documented at Umma. Gasur and especially Umma had good connections with Susa and southern Iran for most of the Sargonic period, the latter via its port at Zabala and both via an outpost at Sabum.[101] Documents from Susa suggest people from Umma were residing there.[102] Later in the Sargonic period these connections were cut off, first perhaps when the Sargonic ensi's were expelled from Susa and Elam,[103] and later when Umma itself was attacked and perhaps destroyed in the time of trouble following the death of Šar-kali-šarri.[104] Her position as Mesopotamia's entrepot with southern Iran was thereafter to be assumed by Lagaš, her perennial rival. Umma also appears to have had direct connections with Dilmun (= Bahrein),[105] Magan (= Makran?),[106] and Meluhha (= Indus Valley?), as an Indus seal impression is said to have been found at the site and a ship's agent from Meluhha received oil rations at the city.[107] Sargon's well-known assertion that ships from Magan and Meluhha docked at Agade,[108] as well as Naram-Sin's conquest of Magan,[109] suggest that the interconnections between Mesopotamia and the Indus Valley were both direct and frequent in this period.[110] As for the North, it is known Ebla exported textiles to Mesopotamia.[111]

[94] *Umma in the Sargonic Period*, Chapter II Part 2 Group 3g. For oil from Umma found at other cities, cf. Nakahara, *Sumerian Tablets Kyoto* 1 (KI.AN); *BIN* 8 333 (Zabala); *Nik* II 48 (Der, Bad-Rabilum); *BIN* 8 298 (Kar-sig$_4$).

Sargonic administrative and private texts provide evidence for a rich vocabulary of commercial terms, including for example ki, "fund",[112] kù-bi, "price",[113] ganba, "equivalent",[114] sag-níg-ga-ra, "capital",[115] níg-(ga), "property, asset",[116] and many others. Space permits discussion of only two terms here: sila-a gál/sig$_7$, and è-a.

The term sila-a gál/sig$_7$ (lit. "on the street") might, especially if one did not believe in the existence of a market place in ancient Mesopotamia,[117] be taken to mean "in transit", but this meaning does not fit all instances.[118] A good example is *CT* 50 80, edited below, Appendix. The most probable explanation of this document is that it is a record of three investments, one in a calf, and the other two in slaves or in the form of deposits with individuals, with the total described as "on the market" (that is, invested with the hope of a profit). The explicit subscription suggests the silver was probably state property confided to a certain Eli the dam-gàr in hopes of a return.[119] In form and content it is similar to the list of investments recorded by Quradum in *CT* 50 74. That there was a commodity market, however primitive the modern economist might dub it, seems undeniable. That there were actual market places is more difficult to prove, but the expression "on the market" implies that such existed.

Another accounting term found in commercial texts is uru-ta è-a, "going out of the city".[120] This belongs to a class of terms that denote where, and on what fund, property was accounted. "In the city" (uru-a), a counterpart, is a well-attested category of goods within the city limits of the place where the accountable office was located. Umma for example was a regional capital and seat of accountability, so goods in the city itself were so described (uru-a), whereas goods in outlying installations or towns were so specified, and changes in their locations noted.[121] Goods uru-ta è-a were goods leaving the place where their accountable office was located, in many cases no doubt for commercial purposes.

Private records of a commercial nature are the most difficult to interpret, as often they lack the formulary of contracts or the entries of disposition of administrative texts. Records such as *PUL* Plate VI No. 20, a list of livestock, 1½ jars of

[112] *MAD* 4 42 (private); *CT* 50 60; *Nik* II 69; *Nik* II 45 (royal); *CT* 50 63 (commercial, with unpublished parallels).

[113] Cf. W. W. Hallo, *HUCA* 30 (1959), 105 with note 6; *CAD K*, 247a. For a brief list of Sargonic prices, see H. Limet, *JESHO* 15 (1972), 31 ff.

butterfat, and one mina of silver, may in some cases be accounts of purely personal property, such as might be acquired from a sale of real estate or grain, or might in other instances be private commercial records the significance of which remains to be discovered.

One helpful criterion for distinguishing commercial texts and contracts from routine administrative records is the use of metrology. In a land where many standards were used side by side, even in the same locality, the possibility of fraud, receiving by one standard and paying back by another, was a real one. The most commonly used standard in commercial texts is the gur-sag-gál-si-sá, "standard gursaggal", composed of 240 sila.[122] In administrative texts the standard is often presupposed, or specified only when doubt might arise. On the other hand, commercial texts generally specify the standard used, in this case the gur-sag-gál, and further define it as the gur-sag-gál-si-sá, "standard gursaggal". This was presumably a regular absolute capacity, as the absolute capacity of the gur-sag-gál probably varied from place to place. Survey of the contexts in which this standard is used suggests that most documents that specify the si-sá measure are commercial transactions.[123]

The day-to-day life of the Sargonic business man is best revealed in his correspondence, as letters sometimes give a clearer picture of his dealings than do records. To quote one example, a business agent from the imperial capital, perhaps sent to Girsu, was prevented from doing any business in the following letter (*MCS* 9 252).

Ur-^{d}Utu-ke$_4$	Thus says Ur-Utu
na-bé-a	
Šeš-šeš-mu	Say to Šeš-šeš:
ù-na-dug$_4$	
[^{I}A]-ga-dè^{ki}-lugal-àm	Agade-lugal-am,
lú A-ga-dè^{ki}	a man of Agade,
na-bí-šám-e	must not make purchases!
ki Ìr-gi$_4$-gi$_4$-šè	Let him return to Irgigi.
lú hé-gi$_4$-gi$_4$	

Study of this and similar documents must of course consider not only the situation but the principals. Was this same Šeš-šeš the one who received silver in *ITT* II 4401 and bitumen in *CT* 50 68, not to mention the gold, precious stones, tin, and other valuables in *ITT* V 9276? Was the sender of this letter also the sender of *ITT* V 9309, and perhaps the ensi himself, as in *ITT* V 6689 (account of gold), *RTC* 83 and 132? Both names are common at Girsu, and the other two elude identification, so such questions must be left open at present for lack of evidence. Many other letters dealing with commercial activity are available, such as *BIN* 8 156; *JCS* 10

[122] Documentation will be found in *Umma in the Sargonic Period*, Chapter III Part 3.

[123] *MVN* 3 19 (shipment of flour to Nippur); *BIN* 8 143, 165, 208, 233 (with gur-mah), 236, 244, 245, 255; note for example the unusual use of this unit at Gasur, in a text in which a dam-gàr appears: *HSS* 10 125 line 4 rev.: [dam-g]àr; cf. *BIN* 8 124. For interesting uses of this unit within administrative contexts, see for example *BIN* 8 230; *ITT* II 4529 (3 different gur in one text); *ITT* II 4560. Note also the use of a standard weight (na$_4$ si-sá) in *ITT* II 5799.

(1956), 13 ff.; *MAD* 1 282 and 290 (part of a large commercial archive, see Appendix).

This preliminary survey of commercial texts from the Sargonic period should conclude by stressing that trade, either institutional or inter-city, may be seen as but one facet of a vital and profitable business activity that flourished throughout the empire of the Sargonic kings and beyond. Individuals, alone or in partnership, the state, on its own behalf or through agents, the king himself, participated in this business activity. Taking a broad view, one may say that the purpose of this business was to keep up the circulation of commodities that were essential to the economy and civilization of the land. From the point of view of the individual businessman, the goal was surely more modest: the good life, neatly summed up perhaps in an otherwise cryptic document that lists a donkey, a garden, and a house in Agade.[124]

Appendix

This appendix contains editions of three selected Sargonic commercial texts, two documents and one letter, in support and illustration of the foregoing discussion.

Text 1: *MAD* 4 17

1) 20 síg ma-na
2) Ama-é-e
3) Barag-nita-ra
4) $ša_6$-ma ì-na-dug_4
5) 15 síg ma-na
6) Ama-é-e
7) Barag-nita-ra
8) ì-na-sum
9) 20 lá 2 síg ma-na

12) Zabala^{ki}-šè
13) gin-né ì-na-sum
14) 8 síg ma-na
15) Ama-é-e
16) Barag-nita-da u_4-bi-ta
17) ì-da-tuk-àm
18) šu.nigín 1 síg gú 1 ma-na

(Translation)

20 minas of wool: Ama-é said to Barag-nita: "buy."
15 minas of wool: Ama-é sold it to Barag-nita.
18 minas of wool: Ama-é sold it to Barag-nita when he went to Zabala.
8 minas of wool: Ama-é has on deposit with Barag-nita from that time.
Total: 1 talent, 1 mina of wool.

(Notes)

For $ša_6$ as a writing for sa_{10}, "buy", see the literature collected by Falkenstein, *NG I*, 121 note 1.

(Interpretation)

In this record Ama-é orders an agent to buy wool, notes the sale of two lots, one when he went to Zabala, the main port and commercial centre of Umma province, and a fourth quantity she entrusted to him when he went to Zabala. This last he was probably supposed to trade with on her behalf.

CRYPTO-JEWS UNDER THE COMMONWEALTH.

A PAPER READ BEFORE THE JEWISH HISTORICAL SOCIETY OF ENGLAND ON RESETTLEMENT DAY.

BY LUCIEN WOLF.

I.—THE SECRET SYNAGOGUE.

In the year which brought Menasseh ben Israel to England, on his memorable mission to Oliver Cromwell, there stood in Cree Church Lane, Leadenhall Street, a large and mysterious-looking gabled house, which differed from its fellows chiefly in the respect that the local gossips could make neither head nor tail of it. Its tenant and owner, one Moses Athias, was understood to be a clerk employed by a rich Spanish merchant and ship-owner, Don Antonio Fernandez de Carvajal, whose mansion almost faced the top of the lane; but his dignified bearing and the marked respect paid to him by many of the foreign merchants, including Carvajal himself, seemed hardly consistent with this theory. Over a glass of canary in the Jeames Tavern hard by, garrulous busybodies would ask one another what use old Athias could have for so large a house, with its basement so strongly barred and its upper windows so impenetrably curtained; and strange tales would sometimes be told of papistical mysteries enacted within its walls by the swarthy strangers and their mincing and bejewelled spouses who flocked thither at frequent but regular intervals. Muffled melodies and nasal recitatives were heard in the still morning air proceeding from the upper stories, and occasionally a newly arrived Dutchman or Italian—for the parish of St. Catherine was a foreign colony—would stop and listen to them, wondering where those uncanny sounds had saluted his ears before. Sometimes a gleam of angry intelligence would light up the listener's eyes, and hurriedly making a sign of the cross or growling out a malediction on the "accursed spawn of Jews," he would hasten on his way.

As a rule, however, the residents tempered their curiosity with a large infusion of tolerance. In any other district of London, Moses Athias's house would probably have been indicted under the Bloody Statute or some other of the pious enactments for putting down seditious sectaries with which the constitution had been thoughtfully armed; but the parish of St. Catherine had been from time immemorial a sanctuary for aliens and heretics, and a place of privilege for unfrocked priests, apostates from Christianity and even converts to Judaism. (1) Consequently, however much the residents may have been

1. Strype's Stow, Book II., p. 8.

Digitized by Google

scandalised by the mysterious heresy which Moses Athias was supposed to countenance, it was not in their interest to give audible expression to their indignation. Moreover, there was an impression in the locality that it was not quite safe to molest the strangers who frequented the Cree Church Lane Conventicle. Don Antonio Carvajal was known to be hand in glove with the Secretary of State, and once when Will Sherman thought to turn an honest penny by denouncing him and his friends as recusants he—the pious Will—was summoned before the House of Lords and roundly upbraided for his pains. (2) Some, too, kept their opinions to themselves from motives of personal prudence. Carvajal, for all his grizzled beard, had a fiery temper, and was no 'prentice hand with the rapier. (3) His servant, Manuel da Fonseca, could double his fist with any Englishman, (4) while Simon de Caceres—Carvajal's great friend—made no more ado of avowing that he was not a Christian than of recounting how he had fought the Inquisition dogs by sea and land. (5) And so nobody interfered with the mysterious house, although its character was so nearly guessed that in 1653 James Howell wrote to his friend Lewis, in Amsterdam, that "touching Judaism, some corners of our city smell as rank of it as doth yours there." (6)

The house, indeed, was a secret Synagogue, and it is probable that it was not the only one of its kind in London at this period. A baptised Jew, one Paul Isaiah, who published a conversionist brochure early in 1655, states, as a fact, within his knowledge, that the Jews at that time resident in England, "have their synagogues and there exercise Judaism." (7) A MS. in the collection of the late Emanuel Mendez da Costa mentions, side by side with the Cree Church Lane Synagogue, another Jewish house of worship in St. Helen's, of which one David Mier was "Priest." (8) Although this record cannot be earlier than 1658, it is not unlikely that the St. Helen's Synagogue was established before that year, and was one of the Jewish houses of prayer indicated by Isaiah. With regard to the date of the establishment of the Cree Church Lane Synagogue, we have no precise information. We know, however, that a Jewish marriage was solemnised in London in 1654 (9); that many of the members of the Marrano community had been settled in the parish of St. Catherine Cree for periods varying from three to twenty years, and that the Crypto-Jews in Spain and Portugal had learnt to regard London as a place of refuge where they could observe the rites and ceremonies of Judaism without being molested, provided they did not invite public attention to their heresy. (10). From the year 1492, when the great expulsion from Spain took place, there seems to have always been a small number of Marranos in this country. Amador de los Rios states in his history of the Jews of Spain that they formed settlements in London, Dover and York. (11) The trade with Hamburg, where Jews were

established in 1583, and the foundation in London of the Society of Merchants of England trading with Spain and Portugal in 1605, must have brought a good many Marranos into relations with this country, seeing that the commerce of the Peninsula was largely in their hands. We have indeed something more than merely conjectural evidence that their relations did extend to this country, for in 1493 Jewish fugitives sued a Spanish merchant in London for a sum of 428,000 maravedis owing on bills of exchange. (12). In 1605 the Anglo-Spanish Trading Company in London petitioned the King to obtain protection for their agents in Spain against the Inquisition. (13) The necessity for such protection is significantly illustrated by the curious fact that the MS. copy of the Company's Charter and list of Freemen, which is to be found in the Harleian collection, has its pages numbered with Hebrew letters. (14) All the lists of aliens and merchant strangers in London drawn up after the beginning of the sixteenth century contain Spanish and Portuguese names, not a few of which—such as Alvarez, Casseres, Da Costa, Lopez and Marchena (15) —are repeated in the earliest lists of the Sephardi Congregations of Amsterdam and London.

These facts would seem to indicate that a Marrano colony existed in London early in the sixteenth century; and if this be the case we may take it for granted that they had some sort of provision for holding divine worship according to the Jewish ritual. The fugitive Marranos in Amsterdam, Hamburg, Antwerp and the South of France established secret synagogues for themselves long before they obtained a toleration as Jews. To men who had been accustomed to organise such services under the very nose of the Inquisition, an enterprise of this kind in London was simplicity itself, for, although Jews were still proscribed in England, no active measures were taken to keep them out of the country, or to identify and prosecute them while they were in it. So long as they did nothing to bring upon themselves the attention of the authorities by offending the common law, or parading their religious views, they were safe. Although a goodly number of unbaptised Jews have been identified as living in England during the Middle Period, there is not one case on record of a Jew being prosecuted by the authorities *qud* Jew. Under these circumstances, we may rely upon it that a secret synagogue was no novelty in England when Menasseh ben Israel arrived here, and it is probable that the mysterious house in Cree Church Lane, which then fulfilled this purpose, had a long history behind it.

We have no contemporary account of this synagogue prior to the Resettlement; and under the circumstances, it is scarcely reasonable to expect one. My identification of it as a Marrano Meeting House is largely circumstantial, and rests on the following grounds :—

1. The strong probability that the Marrano colony, which was certainly in existence before 1640, would have equipped itself with a synagogue.

2. The positive statement of Paul Isaiah that Jewish Synagogues were in existence before 1655.

12. Cal. S. P. Spanish, vol. i. p. 51.

3. The fact, attested by the synagogue archives, that the first Sephardi Synagogue was in Cree Church Lane ([16]).

4. The fact that Moses Athias, who is known to have been Rabbi of the Sephardim in 1658 was a cousin of Carvajal, ([17]) the leading member of the Marrano community, and lived in Cree Church Lane ([18]).

5. The description of this synagogue, given in 1662 by a Christian visitor, one John Greenhalgh, whose letter on the subject is preserved in the Lansdowne Collection of manuscripts ([19]).

Of these points only the last calls for special observation. Greenhalgh's letter shows conclusively that the synagogue which he visited had originally been arranged to suit the requirements of a secret congregation. It was held on the first floor of a private house, and its entrance was protected by three double-locked doors. Although, in 1662, it was still desirable to hold Jewish services with some degree of privacy, it was no longer necessary to observe defensive precautions. These double-locked doors must consequently have been a relic of the secret worship in and prior to 1655, and may be regarded as evidence of the Pre-Resettlement age of the synagogue.

The internal arrangements of the synagogue were, of course, rather primitive. Two rooms were reserved for prayer, the smaller being appropriated to the women and separated from the larger by a partition fitted with a long and narrow latticed window. In the larger room four long forms—two on each side—were provided for the male worshippers. The *banco*, or Wardens box consisted of a seat and desk raised high above the other seats, and occupying the west end of the room. Six feet in front of the *banco*, and on a slightly lower level, was the Reading Desk, with two steps on each side, and brass candlesticks at each corner. The Ark was little more than a plain cupboard flanked by huge brass candlesticks. Two perpetual lamps of "christal glass" hung before it. The walls were fitted with drawers, or "drawboxes," as Mr. Greenhalgh calls them, in which the worshippers kept their books and *Talithim*. Such was the Cree Church Lane Synagogue in 1662, and such doubtless it was seven years before, when as yet it was only a sanctuary of crypto-Judaism.

II.—THE DENUNCIATION.

The circumstances under which the existence of Crypto-Jews in London was made public have fortunately been preserved to us. At the beginning of the year 1656 the little congregation of Marranos found itself beset with serious anxieties. On the one hand, the war with Spain had rendered it dangerous for them to continue to assert their Spanish nationality; on the other hand, the inconclusive result of the Whitehall Conferences on the Jewish Question had offered no satisfactory inducement to them to make public acknowledgment of their Judaism. It had been laid down by the Judges that Jews were free to settle in the country, but under what conditions had not been

stated. A verbal permission to continue to celebrate Divine worship in private had been given them by the Protector (20), but nothing had been said with regard to their civil rights. Only one thing was clear to them—their security as ordinary Merchant Strangers was gone. Thenceforward they had to choose between being persecuted as Spaniards, or subjected to exceptional legislation as Jews. It is not surprising that they should have hesitated as to which of these courses to pursue, for, although the lesser of the two evils before them was palpable enough, no measures had yet been taken to molest Spanish merchants, and there was just a chance that the war might collapse before it had been well begun. Early in March an event occurred which forced them to a decision.

In Doctor's Commons there dwelt at this period a scrivener and notary, named Frances Knevett, who, through his knowledge of Spanish, had obtained a considerable practice among the members of the Marrano community. Mr. Knevett was a man of discretion and resource. He had won the confidence of his perilously-situated clients, not only by the shrewdness of his counsel, but also by his being able to obtain for them—through certain connections of his in the Government Offices—early information of Privy Council Orders affecting foreign traders. When it was determined to issue a proclamation declaring all Spanish monies, merchandise and shipping to be lawful prize, Mr. Knevett was the first to hear of it. His action, on receiving the information, was, however, unwontedly mysterious. Sending for a creature of his, one Philip del Hoyo, he posted him behind a screen in his private office, and then sallied forth to see whether he could run across one of his Spanish clients. In this, he was not successful. He managed, however, to meet with Mr. John Baptista Dunnington, factor to the rich Spanish merchant, Don Antonio Rodrigues de Robles, and he at once invited him to accompany him to Doctor's Commons, in order that he might impart to him some information of the utmost gravity. Mr. Dunnington required no persuasion where the interests of his employers were concerned, and within a few minutes found himself in the scrivener's office, reading the warning note relating to the projected proclamation.

In the conversation which ensued, Mr. Dunnington took no pains to conceal the dismay with which the information had inspired him, and his agitation unloosed his tongue to a perilous extent. It was true, he said, that the cargoes in the two ships belonging to Robles—the "Two Brothers," and the "Tobias"—then in the Thames, were entered in his (Dunnington's) name; but who could guarantee that this would not be found out, especially if Robles' papers were seized? And then there were other ships which he had undertaken to clear for certain Spanish merchants whom Mr. Knevett knew very well, and on these he would lose his commission. Robles's house was crammed with merchandise, and there could not be less than 40 000 ducats in gold in his strong boxes. The loss of all this meant ruin, irretrievable ruin. Moreover, if the Spanish merchants were ruined, he, Dunnington, would also be ruined, seeing that all his business lay with them. And so the panic-stricken factor rambled on, at each step making some fresh disclosure, while Mr. Knevett wrung his hands in sympathetic silence, and Philip del Hoyo behind the screen took copious notes in his pocket-book. Two days later, the house of Don Antonio de Robles in Duke's Place was invaded by bailiffs armed with a Privy Council warrant, empowering them to "seize, secure and keep under

20. S. P. Dom. Commonwealth, vol. cxxv., No. 58.

Digitized by Google

safe custody all the goods and papers therein found," and, at the same time, the Commissioners of Customs, acting under a similar warrant, took possession of the two ships, the "Two Brothers," and the "Tobias." The warrants were based on a "paper of discovery," filed by an informer, giving the name of Philip del Hoyo, with an address in Newton Street (21).

Robles's first idea was to protest against the proposed confiscation of his goods on the ground that he was not a Spaniard but a Portuguese. The petition he forthwith addressed to the Protector, only incidentally mentioned that he was of the "Hebrew nation," being chiefly devoted to claiming the privileges of a Merchant Stranger by reason of his having been born in Portugal, and having resided in London many years and "paved many thousand pounds for Customes." While collecting evidence on this head he experienced some difficulty with a youth in his employ who had accompanied him from Spain to England. According to Mr. del Hoyo, who professed to have overheard Dunnington relate the story, Robles sent for the boy and peremptorily ordered him to say, if he were asked, that his master was a Portuguese. "I cannot lie," answered the youth with an unexpected access of scrupulousness, "for I know you to be a Spaniard." Robles was thunderstruck. "Sirrah!" he exclaimed with angry irrelevancy "I am married to a woman of Portugal." "But that makes you no Portugal" rejoined the smart boy.

Although it seems clear that Robles's account of his nationality was true, he must have soon found that to rest his case on this allegation alone would not be prudent. It was known that he had lived in Spain, that he had passed as a Spanish Catholic and that he had even spent some years of his life in the service of the Spanish Government. Seeing that according to his own account he had flown from Portugal to Spain it is not improbable that he was one of the New Christians who so strangely conspired in 1641 to re-establish the Spanish domination in Portugal (22), and hence his claim to Portuguese nationality would scarcely bear a close scrutiny. One at least of the London Marranos seems to have figured in this conspiracy (23).

In this dilemma Robles took counsel with his coreligionists. Their almost unanimous opinion was that, in view of the Protector's friendly attitude on the Jewish Question, the plea that should be chiefly accentuated was that Robles was a Jew and in this they consented—no doubt for their own protection—to support him. It says much for the strong Jewish spirit of the chief of the Marrano community, Antonio Fernandez Carvajal, that he agreed to throw in his lot with his brethren in this matter, although he was already amply protected by a patent of denization (24) granted to him seven months before, and by special orders of the Privy Council exempting the consignments of his Spanish correspondents from seizure (25). In accordance with this advice Robles, now describing himself as "of the Jewish nation" and omitting all reference to his

alleged Portuguese nationality, addressed another petition to the Protector in which he recited how he and his family had been persecuted by the Inquisition in Spain and Portugal because they were Jews and how he had come to England "intending, therein, to shelter himselfe from those tiranicall proseedings and injoy those beneffitts and kindnesses which this Commonwealth ever aforded to aflicted strangers." Nor did he omit a special appeal to Cromwell's Judeophil sympathies. He had hoped, he said, to continue to enjoy a secure domicile in England "more specially at such tyme when it hath pleased the Lord to place on ye Governement of this nation a Prince soe Benigne and soe much a Protector of afflicted ones as it appeereth your Highnesse hath him pleased to shew your selfe on behalfe of our nation the Jews." Cromwell sent both petitions to the Council, who immediately instructed two of their body, General Disbrowe and Colonel Philip Jones, to make due inquiry into the case, empowering them to take evidence on oath. At the same time, in order to protect themselves against all possible consequence of the discovery of their Jewish identity six of the chief Marranos with Manasseh ben Israel at their head petitioned the Protector for a confirmation in writing of his verbal permission to celebrrte divine worship according to Jewish rites in their Secret Synagogue ([26]).

On the very day, the 25th March, that this petition was referred to the Council ([27]) Disbrowe and Jones opened the Robles enquiry. It lasted until the 14th May. A number of witnesses were examined and cross-examined, including no fewer than ten members of the Marrano community, three of whom frankly avowed themselves to be Jews. Antonio Fernandez Carvajal and Simon de Souza deposed that Robles was born at Fundao in Portugal and that they had been acquainted with his father and mother and other of his kindred. Duarte Henriques Alvarez, uncle to Robles, gave similar evidence, and added that his nephew was a Jew by birth and conviction. Five of the witnesses, Domingo Roiz Francia, Diego Roiz Aries, Simon de Caceres, Domingo Vaez de Brito, and Manuel Martinez Dormido, swore positively that Robles was a Jew, that he was married to a Jewess, and that he had suffered at the hands of the Inquisition. De Caceres, who described himself as "of the Jewish nation and of the tribe of Judah," mentioned in his evidence that when Robles first came to England some years before he had confided to him (the deponent) that he was a Jew. Another witness, Domingo de la Cerda, book-keeper to the accused, testified to the Portuguese birth and Jewish religion of his master, and Antonio de Porto also expressed his strong belief that Robles was a Jew. It is curious to notice that De Porto was the only Jewish witness who still adhered to his Marrano disguise, declaring that he was a Spaniard and Roman Catholic.

Robles himself was examined and cross-examined at considerable length and told a curious story of the shifts to which he had been driven in his efforts to disguise his Judaism. His avowal that he had been in the habit of attending mass even in London, and that he was still uncircumcised, produced an unfavourable impression on the minds of the Commissioners who, of course, had no knowledge of the devious ways of the Crypto-Jews. A similar confession could, however, have been elicited from almost all the other Crypto-Jews had

26. S. S. Dom. Commonwealth, vol. cxxv., No. 58.

27. For some unexplained reason it does not seem to have been delivered to the Council until the 26th June (*vide* endorsement).

Digitized by Google

they been examined on these points. (28) Several non-Jewish witnesses likewise gave evidence, among them being the factor Dunnington and the notary Knevett. In a supplementary deposition made by Dunnington on April 24th, he created something of a sensation by unmasking the secret designs of Knevett in setting the enquiry in motion. It seems that the intriguing notary had been quite unprepared for the line of defence adopted by his intended victim, and when he found that the Jewish plea was likely to carry the day, he attempted to bribe Dunnington to perjure himself. He confided to the factor that it was his intention to petition for a clerkship in the Committee of Discoveries, where his knowledge of the private affairs of the Marranos would, of course, stand him in good stead, and he promised to reward Dunnington if he would give evidence in the sense he required. Furthermore he endeavoured to smooth away Dunnington's scruples of conscience by assuring him that it was no sin to swear anything against "a Jew dog." Dunnington was neither a Christian nor a Jew—in fact he boasted that he professed no religion (29)—but he seems to have possessed his full share of natural honesty, for he not only rejected Knevett's proposals, but he marched straight down to Whitehall and informed the Commissioners of them. When Knevett's turn to be examined arrived the wily notary, seeing that the game was up, attempted to regain the favour of his betrayed client by countenancing the contention that he was a Jew and not a Spaniard.

Nevertheless, the report of the Commissioners was not wholly satisfactory. They declared themselves unable to arrive at a positive opinion with regard to "either the nation or religion" of Robles. The evidence seemed to them conflicting, but they pointed out that the balance of testimony was in favour of the theory that the petitioner was "a Jew borne at Fundao in Portugall." The Council showed less hesitancy in arriving at a conclusion. They ordered the immediate discharge of the warrants issued against Robles, and the restoration to him of his ships and merchandise.

This case was the turning point in the history of the London Congregation of Marranos. It brought them for the first time into the light of day as a Jewish community. Thenceforth they were compelled to rely for whatever privileges they might claim in this country not upon their foreign birth, but upon their quality as Jews.

III.—THE CONGREGATION.

The members of the secret congregation revealed by the Robles case have a more important claim to be remembered by the Anglo-Jewish historian than that which arises from the romantic circumstances of their disguise and discovery. It is, of course, of considerable interest to find that the ramifications of Spanish and Portuguese Marranism—traced as they have been to so many countries—also extended to England; but to us the importance of these Crypto-Jews consists, less in their connection with the extraordinary subterranean movement by which the mediæval Sephardim of all countries contrived to baffle the Inquisition, than in the fact that they were the Founders of our Anglo-Jewish community in the form in which it exists to-day. There may be, and perhaps

28. Violet: "Petition against the Jews," p. 4.
29. S. P. Dom. vol. cxxvii., No. 21 (Dunnington's Deposition).

Digitized by Google

always will be, differences of opinion as to the precise value of the services rendered to the Resettlement cause by the several Jews who took part in the negotiations with Cromwell; but that the men who formed the congregation which preceded and survived those negotiations have a right to be honoured as the Founders of our community, none can doubt. For this reason I have been at considerable pains to draw up a list of this congregation, and I have succeeded in identifying no fewer than twenty-six of its male members, all of whom can be proved to have been Jews, and to have resided in London before the Resettlement negotiations were set on foot.

My principal authorities for this list are three documents, copies of which I have much pleasure in offering to this Society. Two of them have not hitherto been printed. The first is the Jewish petition of March, 1656, to which I have already referred ([30]); the second is the *dossier* in the Robles case, and the third is the will of Antonio Carvajal. These supply me with nineteen names; the remaining seven have been obtained from miscellaneous sources.

The petition of March, 1656, is the most important of these documents—the most important, perhaps, of all the documents connected with the Resettlement, since it is the only definite proof we possess that the negotiations with the Protector resulted in a specific concession to the Marranos. It is further of value as indicating who among the Crypto-Jewish Congregation took an active part in these negotiations, thus signalising to us the men to whom the gratitude of the Anglo-Jewish community is in this respect pre-eminently due. The following is the list of its signatories :—

Menasseh ben Israel,
David Abarbanel,
Abraham Israel Carvajal,
Abraham Coen Gonsales,
Jahacob de Caceres,
Abraham Israel de Brito,
Isak Lopes Chillon.

Deducting Menasseh ben Israel, who was only a bird of passage, this gives us the names of six of the leading Jewish residents in London at this period. That they were residents, and not companions of Menasseh in his embassy, I have already shown in an examination of the document to which their signatures are attached, contributed to the *Jewish Chronicle* four years ago.([31]) The result of my investigations, resting largely on a comparison of signatures, was to prove beyond doubt that David Abarbanel was identical with Manuel Martinez Dormido, Abraham Israel Carvajal with Antonio Fernandez Carvajal, Jahacob de Caceres with Simon de Caceres, and Abraham Israel de Brito with Domingo Vaez de Brito, all Jewish merchants settled and trafficking in London long prior to the arrival of Menasseh. The other two signatories do not appear to have used secular aliases, but one of them, Gonsales, has been shown to have been a permanent resident ([32]) while Chillon is scarcely likely to have figured in this company unless his interests in the question at issue were equal to those of his companions.

The documents in the Robles case, (33) contain the names of eleven Marranos. Four of them—Dormido, Carvajal, de Caceres and de Brito—already figure on the Petition of March, 1656 ; consequently we have a net contribution from this source of seven names to our list. These are :

Antonio Rodrigues Robles,
Simon de Souza,
Duarte Henriques Alvares,
Domingo Rodrigues Francia,
Diego Rodrigues Aries,
Domingo de la Cerda,
Antonio de Porto.

Robles, Alvares and Cerda described themselves as Jews in the evidence they gave before the Commissioners, and also stated that they had been resident for a considerable period in London. That Simon de Souza was a Jew is rendered all but certain by the fact that he is mentioned in Carvajal's will as the latter's brother-in-law. Domingo Francia was founder of a Jewish family which for several generations figured prominently in the politics of Bevis Marks. The probate of his will (34) shows that he died early in 1688, and thus enables us to identify him with Israel Roiz Francia, whose death is entered on the Beth Holim Burial Register, under the date of Adar 1st, 5448. The name of Diego Rodrigues Aries appears on one of the lists of "Jews resident in London about 1658 or 1660," which were given by Dr. Chauncey to Emanuel Mendez da Costa, and are preserved among the MSS. of the latter (35). Antonio de Porto was the last of the Marranos to throw off his disguise. In the Robles case, he protested that he was a Spaniard and Roman Catholic, but in 1690 his remains received Jewish burial under the name of Abraham de Porto (36).

The third document, the will of Antonio Fernandez Carvajal, (37) supplies us with the following six further names :—

Alonzo Jorge Carvajal,
Joseph Ferdinando Carvajal,
Manuel Rodrigues Nunez,
Manuel da Fonseca Meza,
Moses Israel Athias,
Abraham de Touar.

Alonzo and Joseph Carvajal were sons of Antonio. As they were not yet of age in 1659, and as their father had then been settled in London for nearly thirty years (38), it is probable that they were born in England. That they were resident here before the Resettlement negotiations is shown by the patent of denization granted to their father in 1655, in which they are mentioned (39). Manuel Rodrigues Nunez is described as a brother-in-law of the testator, and

the remaining three legatees as his cousins. Nunez and Athias are mentioned as Jews in the Mendez da Costa lists, Athias being described in one of them as "Sin. Moses Atias, Chrechurch Laine, a Jewish Ribay," (40) and in the other as "Sin. Moses, ye prist at ye Sinagoge." (41) It is chiefly on the evidence afforded by these entries, and also by Athias's connection with Carvajal that I have proposed to identify "Sin. Moses" as the Chacham of the Secret Synagogue of the Marranos. Manuel da Fonseca Meza is also specifically referred to as "a Jew" in some litigation in which he and Carvajal became involved in 1658 (42). In his patent of denization (43) he is described as Jacob da Fonseca Meza.

The remaining seven names in my list are the following :—

Solomon Abarbanel Dormido,
Aron Abarbanel Dormido,
Alonzo da Fonseca Meza,
Augustine Coronel Chacon,
David da Costa,
Bento de la Costa,
Henrique Jorge Mendes.

Solomon and Aron Dormido were sons of David Abarbanel *alias* Manuel Martinez Dormido. Their names appear in a letter from Oliver Cromwell to the King of Portugal, dated 1654 (44), and in their father's petition for denization in 1661 (45), in which it is stated that they had been resident in London seven years. Alonzo da Fonseca Meza was brother to Manuel (46) who is mentioned in Carvajal's will. That he was resident in London while the Jews were still a secret congregation, is shown by a pass issued to him in March, 1655, to proceed to Antwerp (47). In this document he is described as "servant to Antonio Fernandez Carvajal." By his denization, granted in 1661 (48) it is shown that he returned to England and resided here permanently. Augustine Coronel Chacon first appears in the State Papers in 1652 (49). He is mentioned as "the littell Jue" in the accounts of an insurance broker for the same year, preserved in the Bodleian (50). His name is also found—half erased—on one of the Mendez da Costa lists (51), the erasure being due to the fact that on the Restoration he allowed himself to be baptised. David da Costa was a well-known member of the Da Costa family, which played an important part in the English Jewry during the early days after the Re-settlement. An undated petition from him appears in the State Papers, and is assigned by the editors as "clearly belonging to the reign of Charles I." (52).

Bento de la Costa is mentioned in the State Papers as arriving in England with his family in 1655 (53). I fancy the name is a mistake or an alias for Alvaro da Costa, one of the leading Jewish merchants of the Restoration. That he was a Jew, is demonstrated by a very curious piece of circumstantial evidence. In the Thurloe Papers (54), under date of November, 1656, appears a reference to "a Jew named da Costa, a great merchant in London, who hath and is presently to receive the sum of £4,000 for the use of Charles Stuart." In the bankruptcy of Augustine Coronel Chacon in 1665, the banker Backwell proved for £4,000, which he stated he had advanced to Coronel "on behalf of the King" (55). Now Coronel and Bento de la Costa were friends, for when the latter, on his arrival from Dunkirk in 1655, was stopped at Margate under a restraint of alien immigration, Coronel became his surety that he would appear before the Council if he were allowed to proceed to London (56). A connection between the two men being thus established, it seems highly probable that the £4,000 lent by Backwell to Coronel "on behalf of the King" was the same £4,000 that, according to the Thurloe Papers, the "Jew named Da Costa" received "for the use of Charles Stuart," and that consequently this "Jew, named Da Costa" was identical with Coronel's friend, Bento de la Costa. My last name, Henrique Jorge Mendes, is that of a merchant whose large transactions are frequently referred to in the State Papers as far back as 1651. In none of these documents, however, is he spoken of as a Jew, and as he left London in May, 1655 (57), the papers relating to the Resettlement negotiations do not mention him. There is, however, abundant evidence that he belonged to the Carvajal and Caceres set, and, as he afterwards settled in Antwerp, I have hypothetically identified him with one Henrique Mendes da Costa, who is referred to in the family papers of Emanuel Mendez da Costa as an early member of his family resident in that city and who had visited England (58). Henrique Mendes da Costa, who was a brother of David da Costa, was also partner in business of another brother named Jorge. Hence it is reasonable to suppose that "Henrique Jorge Mendes" was a trade alias intended to represent this partnership. Such aliases were of common occurrence among the Marranos.

This exhausts my list of adult male members of the Jewish Congregation which Menasseh ben Israel found in London when he arrived on his memorable mission, and to which probably he was referring when, five years earlier, he had publicly thanked the British Parliament—no doubt much to the astonishment of that body—for the practical favour shown to his coreligionists by the government of the Commonwealth (59). This list, however, does not exhaust my census of the Marrano community. It will be remembered that in Greenhalgh's description of the synagogue which I have ventured to claim as the house of prayer of the Crypto-Jews, a chamber is mentioned as having been partitioned off by means of a latticed window from the main room, and reserved for female worshippers (60). We have evidence that this room was not un-tenanted,

since a goodly number of the male congregants were married. The names of their wives are known, as, for example, Mary (Esther) Carvajal ([61]), the wife of Antonio; Sarah Athias, the wife of the Rabbi; Deborah, wife of Manuel Rodrigues Nunes; Sarah, wife of Manuel Dormido; Leonora, wife of Antonio Robles; Rebecca, wife of Domingo Francia ([62]), and Sarah, wife of Abraham de Porto ([63]). The wills of many of the Marranos disclose the fact that their marriages were not unfruitful and that, indeed, many native-born sons and daughters were reared to gladden their perilous existences.

Of the internal condition of our secret community not a few interesting glimpses are afforded by the documents I have succeeded in unearthing. The congregation itself does not seem to have possessed a very complex organisation for until long after it had ceased to be held in secret, it had no written constitution ([64]). Its spiritual direction was in the hands of Moses Athias, who was probably a connection of the distinguished Marrano family of that name, which, in the seventeenth century, produced at least one martyr in Spain and supplied Hamburg, Amsterdam and Leghorn with several learned Chachamim Antonio Carvajal and Simon de Caceres seem to have been the Parnassim, since it was they who signed the lease of the first cemetery at Mile End, acquired by the congregation in 1657 ([65]). De Caceres was an enthusiastic Jew, very proud of his Hebrew descent, and he made it his business to go among the Spanish and Portuguese merchants and obtain from them confidential avowals of their Judaism ([66]). The social condition of the community appears to have been excellent. All its members were respected merchants, and some of them were exceedingly wealthy. They owned a considerable amount of shipping, and their transactions extended to the Netherlands, France, Spain, Portugal, the Canary Islands, Italy. Syria, Brazil and the East and West Indies. Carvajal possessed large estates in the Canaries; Dormido had considerable property in Pernambuco, and branches of Caceres's business were established at Hamburg, Barbadoes and Martinique. They dealt in bullion, cloth, wool, wine, hides, sugar, corn, logwood, precious stones, gunpowder, cordage, timber, cochineal, silks, plate, horses, carriages, harness, &c. Coronel Chacon was financial agent to the Portuguese Government ([67]). It is interesting to notice that throughout the recorded transactions of these early Jews there is not a trace of money-lending. Many of them deposited their spare cash with Gentile goldsmiths, but more for security than for interest. Six of them—Augustine Coronel Chacon, David da Costa, Domingo de la Cerda, Abraham de Porto, Domingo Francia and Antonio Robles—banked with the famous Alderman Backwell, and their accounts are still to be seen in the old ledgers preserved at Childs' Bank. Almost all dwelt in substantial houses within easy walking distance of the synagogue. Manuel Nunes lived in Cree Church Lane itself; Coronel and Francia in Leadenhall Street; Diego Aries in Fenchurch

Street; Dormido in Great St. Helens, and De Porto in St. Mary Axe. Three others—Coronel Chacon, Duarte Alvares and Antonio Robles—formed the nucleus of the New Jewry in Dukes Place ([68]). The personal bearing of the Marranos stamped them as men of spirit, culture and experience. Carvajal rode a horse and carried sidearms ([69]). His temper was somewhat choleric, and he once settled a dispute with the Excise authorities by organising a raid on the Customs warehouses and imprisoning the officials in one of his own ships ([70]). De Caceres had pronounced military tastes, besides being a Chauvinist Jew. He drew up a plan for the conquest of Chili, and offered Cromwell to organise the expedition and command it himself ([71]). He was a relative of Spinoza, ([72]) and had known, and was personally esteemed by, Queen Christina of Sweden ([73]). Duarte Alvarez had filled the post of Royal Treasurer in the Canary Islands ([74]), and Dormido had held a similar appointment for the province of Andalusia ([75]). They had all travelled in many countries, some only in the old world but others in the New, and the experience and mercantile connections they had thus acquired were of no little use to Cromwell in his colonial policy and the conduct of his foreign wars ([76]). Augustine Coronel Chacon beguiled his leisure with poetry. He was an intimate friend of Antonio Enriquez Gomez, the distinguished Marrano soldier of fortune and lyrical poet, and he contributed a sonnet to one of Gomez's works ([77]). In politics the community took a lively interest, and Cromwell's philo-Jewish attitude did not prevent some of its members from espousing the cause of the Cavaliers. Indeed, Coronel's services to the Stuarts earned him the honour of knighthood after the Restoration ([78]).

Such was the community of Crypto-Jews which in the middle of the seventeenth century constructed the foundations on which the imposing edifice of English Jewdom has since been reared.

Early Examples of Marine Insurance

I

THE problem of the origins of marine insurance is one of the most complicated and controversial questions in the history of business institutions. One cause of this confusion is the fact that the earliest documentary sources are often ambiguous and lend themselves to widely varying interpretations. The legal writers, who have done most of the research on the early history of insurance, have focused their attention upon certain documents of the late thirteenth and the early fourteenth centuries.[1] As these sources unfortunately give incomplete information, the results of all this research have been rather disappointing. The minute scrutiny with which the legal writers have examined the early documents has produced subtle and brilliant examples of textual criticism but has also given rise to conflicting theories which have confused the issues instead of clarifying them.

It is not the purpose of this study to resolve the subtle points of law on which the lawyers differ. On the contrary, in giving a general survey of the work that has been done on the early history of marine insurance, it will be

[1] English writers have been little interested in the history of insurance. The pioneering work on the subject, *Il Contratto di assicurazione nel medio evo*, was written in 1884 by the Genoese lawyer, Enrico Bensa. It is still the basic work, although more for the documents than for their interpretation. In his later book, *Francesco di Marco da Prato, notizie e documenti sulla mercatura italiana del secolo XIV* (Milan, 1928), Bensa gave additional examples of insurance contracts, but there are no new forms. The German professor of law, Levin Goldschmidt, in his *Universalgeschichte des Handelsrechts* (Stuttgart, 1891), made important contributions to the subject by using source material unknown to Bensa, such as the records of a Marseilles notary published by Louis Blancard, *Documents inédits sur le commerce de Marseille au moyen âge, contrats commerciaux du XIII^e siècle* (2 vols., Marseilles, 1884–85). The conclusions of these first writers were challenged by the more critical German scholar, Adolf Schaube, in his three brilliant studies: (1) "Die wahre Beschaffenheit der Versicherung in der Entstehungszeit des Versicherungswesens," *Jahrbücher für Nationalökonomie und Statistik*, LX (1893), 40–56, 473–509; (2) "Der Uebergang vom Versicherungsdarlehn zur reinen Versicherung," *ibid.*, LXI (1893), 481–515; (3) "Der Versicherungsgedanke in den Verträgen des Seeverkehrs vor der Entstehung des Versicherungswesens. Eine Studie zur Vorgeschichte der Seeversicherung," *Zeitschrift für Social- und Wirthschaftsgeschichte*, II (1894), 149–223. Although his interpretation of the sources—those previously used and some he presented for the first time—sometimes shows an excess of ingenuity, Schaube is usually clear and convincing. His grasp of all the available material relating to the subject and his masterly analysis make his studies of permanent value. After him, interest in the subject declined. Discussion has flared up anew in recent years with the publication of a series of articles in legal journals by the Italians, Alessandro Lattes, Giuseppe Valeri, Riniero Zeno, and the Frenchmen, André E. Sayous and Jules Valéry. In his article "I Primordi dell'assicurazione attraverso il documento del 1329," *Rivista del diritto commerciale*, XXVI, Part 1 (1928), 600–41, G. Valeri gives a full bibliography on the early history of marine insurance and summarizes the views of the different writers. Only a few articles and one book (by Zeno) have appeared since Valeri wrote. These will be referred to in the course of this study.

Downloaded from https://www.cambridge.org/core. Newcastle University, on 26 Jan 2017 at 03:10:13, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/S0022050700112975

frankly stated when the available evidence seems to a layman inconclusive. The business purposes for which the various forms of contracts could be used are my central interest. The significance of recently discovered material will be emphasized from the point of view of how marine insurance could be used in the affairs of medieval merchants. This new material includes notarial contracts of Palermo, dating from the first half of the fourteenth century, which shed additional light on some of the most debated points. To this Sicilian material will be added new information on insurance rates taken from a fifteenth-century ledger of a Florentine merchant.

II

Most authorities on the subject agree that marine insurance was unknown to Greek and Roman antiquity.[2] The first insurance contracts were made by Italian merchants of the Middle Ages to whom we apparently owe the invention of the bill of exchange, of double-entry bookkeeping, and of commercial banking, as well as other innovations in business procedure. The date of the earliest example of premium insurance is one of those moot questions on which the legal writers have failed to agree. Some of them consider certain ambiguous texts as sufficient evidence of the existence of premium insurance, but others are more cautious and question the value of anything that is not clear and explicit. At any rate, there is no doubt that genuine insurance was a product of the commercial revolution which occurred during the period from 1275 to 1325 or thereabouts.[3]

This period saw the decline of the traveling or caravan trade which centered in the fairs of Champagne, and the rise of a new type of business organization in which the "sedentary" or resident merchant was the central

---

[2] In addition to the works mentioned in note 1, see Wilhelm Silberschmidt, "Das Seedarlehen als Ausgangspunkt der Versicherung gegen Prämie," *Veröffentlichungen des Deutschen Vereins für Versicherungs-Wissenschaft,* Heft XXXVIII (May 1926), 9–16; Raffaele Cafiero, "Origine delle assicurazioni marittime," Convegno internazionale di studi storici del diritto marittimo medioevale, Amalfi, 1934, *Mostra bibliografica e Convegno internazionale di studi storici del diritto marittimo medioevale, Atti,* I (Naples, 1934), 73–79; Aldo Checchini, "I Precedenti e lo sviluppo storico del contratto di assicurazione," *Atti dell'Istituto Nazionale delle Assicurazioni* (Rome, 1931), III, 58–68. The only work that attempts to prove the existence of marine insurance in the ancient world is C. E. Trennery, *The Origin and Early History of Insurance* ("Studies in Economics and Political Science of the London School of Economics," LXXXVII, London, 1926). Trennery devotes less than half a page to medieval Italy, where marine insurance really developed. He ignores completely the works of Bensa, Goldschmidt, and Schaube on the subject.

[3] Raymond de Roover, "The Commercial Revolution of the Thirteenth Century," a discussion of "Capitalism—Concepts and History" by N. S. B. Gras, *Bulletin of the Business Historical Society,* XVI, No. 2 (1942), 34–38.

Downloaded from https://www.cambridge.org/core. Newcastle University, on 26 Jan 2017 at 03:10:13, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/S0022050700112975

figure.[4] This new type of businessman tried to direct all his affairs from the countinghouse; he used partners, factors, or correspondents to represent him in foreign parts.[5]

The traveling merchant had felt little need for insurance. On land, he sought safety in concerted action with other traveling merchants. They journeyed to the fairs in armed caravans and banded together in hanses and universities for the protection of their rights in foreign lands. On sea, the traveling merchant accompanied his goods. He tried to protect himself against pirates and privateers by traveling in convoy. While he could thus "insure" (or protect) himself to a certain extent against the *risicum gentium*, there was not much he could do against the *risicum maris* or the perils of the sea. If the ship that carried him foundered or was smashed on the rocks, the traveling merchant often lost his life as well as his possessions. Since ships were frequently lost, any overseas venture involved great risks.

The traveling merchant did not always operate with his own capital. This was often supplied in whole or in part by a partner who stayed ashore. The partner also ran the risk of losing his investment in case of mishap, but he could avoid heavy losses by entrusting his money to different merchants traveling on different ships. In the Genoese notarial records of the twelfth and thirteenth centuries, there are many examples to show that such a policy of dividing the risk was actually followed by the capitalists who financed the trade with the Levant.

Partnerships between an investing partner who stayed at home and a managing partner who went abroad were generally formed for a round-trip voyage from Italy to the Levant. Usually the investing partner supplied all or most of the capital for the venture. If the goods were lost but the traveling merchant was saved, the latter had no residual obligations toward the partner who had supplied the funds. Both partners shared in the profits and in all the risks of the venture. The ownership of vessels was usually divided so that the burden of the risk was assumed by several individuals.[6] Partner-

[4] I use the word "sedentary" in the meaning attached to it by N. S. B. Gras. Some writers do not like this term but they have not been able to suggest a better one. See N. S. B. Gras, *Business and Capitalism; An Introduction to Business History* (New York: F. S. Crofts and Company, 1939), chap. iii.

[5] The words "partners" and "correspondents" need no definition, but the word "factors" had a special meaning in the Middle Ages. It was used chiefly for salaried employees who served a merchant as agents abroad.

Downloaded from https://www.cambridge.org/core. Newcastle University, on 26 Jan 2017 at 03:10:13, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/S0022050700112975

ship contracts thus permitted a division of risk, but they did not provide for a transfer of risk. In order to shift risks, various forms of loan, exchange, and sales contracts were devised which in practice afforded some kind of protection akin to insurance.

One of these contracts originating in the business communities of the seaports was the sea loan or *foenus nauticum* by which an investor lent a given sum of money to a traveling merchant with the understanding that the loan would have to be repaid only if the ship returned safely to port (*sana eunte nave*).[7] Such a loan could have afforded complete protection only if the borrower had refrained from investing the amount received in a mercantile venture and had kept the specie locked up on land. In actual practice the proceeds of sea loans were usually invested in overseas ventures by the borrowers. If the ship did not return, the borrower or his heirs had no contractual obligations toward the lender. While the sea risk was transferred to the lender, he assumed no responsibility for poor business management. In other words, he did not share in the profits of the venture; his return was limited by the difference between the amount of the advance and the amount repayable upon safe arrival of the ship.

Sea loans were not made *gratis et amore,* even when the contract so stipulated, but the lender received interest and a compensation for the risk, probably by withholding part of the sum named in the contract. For this reason, the sea loan fell under the suspicion of usury and was condemned in 1236 by Pope Gregory IX in his decretal *Naviganti.* Whether or not this decretal produced a decline in the number of sea loans is a disputed point.[8]

Either because of the opposition of the church or, more likely, because of changes in business methods, the popularity of the sea loan declined in the thirteenth century in favor of the *cambium nauticum* or maritime exchange contract, which differed from the ordinary exchange contract (*cambium*) in one important respect: in the case of the *cambium nauticum,* the fulfill-

[7] On the sea loan, see Goldschmidt, *Universalgeschichte,* pp. 345–54, and Calvin B. Hoover, "The Sea Loan in Genoa in the Twelfth Century," *The Quarterly Journal of Economics,* XL (1925–26), 495–529. This article is not entirely reliable. The medieval sea loan should not be confused with the "bottomry loan," which is, strictly speaking, a loan made by a shipmaster for repairs to his ship in a foreign port. Such a loan is contracted by the master but is repayable by the owners, if the ship reaches its destination.

[8] Hoover ("The Sea Loan," pp. 499 f., 529, n. 1) questions whether the decree *Naviganti* had any appreciable effect on the decline of the sea loan, but Riniero Zeno believes that Gregory IX's decretal was responsible for the popularity of the *cambium nauticum,* which did not fall under the usury prohibition since such a contract could not be classed as a *mutuum.*—Riniero Zeno, *Storia del diritto marittimo nel Mediterraneo* (Catania, 1915), pp. 160 f. This is also the opinion of Adolf Schaube, "Der Versicherungsgedanke in den Verträgen des Seeverkehrs," *op. cit.,* pp. 176 f.

Downloaded from https://www.cambridge.org/core. Newcastle University, on 26 Jan 2017 at 03:10:13, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/S0022050700112975

ment of the contract, instead of being unconditional, was contingent upon the safe arrival of the goods pledged in security. The *cambium nauticum*, like any other exchange contract, involved a permutation of monies, since the sum advanced by the lender in local currency was repayable abroad in a different kind of specie. The permutation was made at a rate which included both interest and compensation for risk. Interest in the Middle Ages was always included in the price or rate of exchange, so that the lender or buyer of foreign exchange was bound to gain in most cases.[9] The effect of the *cambium nauticum*, like that of the sea loan, was to shift the sea risk from the borrower to the lender. In general, the terms of the contract placed such a low valuation on the foreign monies that the charges to the borrower were not infrequently greater than the profits which he could make from the sale of the goods pledged as security.

As a means of insurance against risk, the *cambium nauticum* or maritime exchange contract had serious drawbacks. It forced the exporting merchant to "take up" money whether or not he was short of funds and to pay high for its use.[10] The *cambium nauticum* shared this disadvantage with the *foenus nauticum* or sea loan. In addition, the *cambium nauticum* was repayable abroad in a foreign currency whereas the sea loan was repayable at the termination of a round-trip venture. Therefore, the *cambium nauticum* presupposes a more complicated organization of international trade, since the lender had to have a representative abroad who would collect the amount promised in the contract. Usually the borrower paid the representative or agent of the lender out of the proceeds from the sale of the wares brought overseas. Such a repayment limited the amount that was available for reinvestment in goods for the return voyage. Perhaps the merchant had an opportunity to borrow again by entering into another exchange contract providing for repayment in his home port, either conditionally (*cambium nauticum*) or unconditionally (*salvo in terra*).

The existence of such possibilities is evidence of the gradual emergence of an organized money market. This development was completed in western Europe by the middle of the fourteenth century. By this time, the transition

[9] As Mr. de Roover has shown, the exchange contract always involved a credit transaction as well as an exchange transaction. Because of the usury prohibition, bills were not discounted, but interest was buried in the rates of exchange. Consequently, the banker's profit, instead of being certain, was uncertain because it was determined by the unpredictable swing of the exchange rates. See Raymond de Roover, "What Is Dry Exchange? A Contribution to the Study of English Mercantilism," *The Journal of Political Economy*, LII (1944), 250–66.

[10] Schaube, "Der Uebergang vom Versicherungsdarlehn zur reinen Versicherung," *op. cit.*, p. 483.

Downloaded from https://www.cambridge.org/core. Newcastle University, on 26 Jan 2017 at 03:10:13, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/S0022050700112975

from the traveling merchant to the sedentary merchant had taken place. The handbook of Pegolotti, written in the mid-fourteenth century, gives regular quotations of foreign exchange and the rates of brokerage charges on exchange contracts. Such charges were higher in the case of maritime exchange than in the case of ordinary exchange.

In the course of the fourteenth century, the ordinary *cambium* contract became much more popular than the *cambium nauticum*. The lending of money by the purchase of bills of exchange was almost exclusively in the hands of Italian merchant-bankers who were well provided with capital and who had representatives in the most important commercial centers. These merchant-bankers were not specialized. They combined trade, banking, and underwriting. They also bought and sold bills of exchange for others on a commission basis. To divide risk was the keynote of the business policy followed by the international merchant-bankers. The same policy was followed by the lesser merchants. The business risk was split by buying goods in joint account with other firms. The turnover of capital and, consequently, the profits were increased by borrowing additional funds, usually by selling bills of exchange. In most cases the merchant-bankers were lenders and the lesser merchants were borrowers. Since ordinary bills of exchange were payable in any event, some means had to be devised for shifting the sea risk, otherwise an unlucky borrower might find himself in dire straits with his bills reaching maturity and his goods at the bottom of the sea.

The increased use of bills of exchange for the financing of foreign trade thus created the need for a new type of contract. The merchant-bankers, who themselves operated with borrowed funds, were not willing to run any sea risk, and the borrowers whose commitments were unconditional had to find someone who would take over this risk. There is a close connection between the development of terminal partnerships, of the bill of exchange, and of premium insurance. They are all the result of the transition from the traveling trade to that which centered around the sedentary merchant.

The merchants, in their search for a new type of contract, did not immediately hit upon the idea of premium insurance. They experimented first with a form of contract, the so-called "insurance loan," which contained already several of the elements present in real marine insurance but proved to be unsatisfactory for the full coverage of risk. The expression "insurance loan," in accordance with the practice of the German and Italian writers, is used here for lack of a better term.[11]

[11] The Germans use *Versicherungsdarlehn;* the Italians, *prestito a scopo assicurativo.*

Downloaded from https://www.cambridge.org/core. Newcastle University, on 26 Jan 2017 at 03:10:13, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/S0022050700112975

The following three elements characteristic of real marine insurance are found also in the insurance loan: (1) the insured or borrower remained on land; (2) the goods insured were sent unaccompanied; (3) the loan was repayable not upon safe arrival of the ship (*sana eunte nave*) but upon the safe arrival of the borrower's goods (*mutuum ad risicum maris et gentium*). Naturally, this latter provision offered better protection to the borrower, since it could happen that his goods were missing even if the ship and most of its cargo made port.[13] For example, it sometimes occurred that part of the cargo was taken from a ship by pirates or assailing thieves and that the rest was left untouched.[13]

This provision regarding the safe arrival of the goods had already appeared in the maritime exchange contracts. It is also found in some late examples of sea loans.[14] The insurance loan differs from these other contracts in that the lender was always a shipowner, and the borrower, a shipper.

The earliest known examples of insurance loans are found in some Palermo documents dating back to the end of the thirteenth century. As has been stated, these insurance loans were repayable only upon safe arrival of the goods shipped overseas and were granted by shipowners to merchants who remained ashore instead of accompanying their merchandise. If the goods did not arrive at destination, the shipowner would receive neither the freight nor the money advanced to the shipper before sailing. There has been much speculation among historians about the motives that prompted owners to increase their risk by granting loans, the repayment of which depended upon the safe arrival of the ship. Possibly shippers distrusted shipmasters and required additional guarantees when the goods were not accompanied. By making a loan to the shipper, the shipowner acquired an interest in the cargo entrusted to his care.

It appears from the surviving examples that insurance loans rarely covered the full value of the cargo, but only 25 or 30 per cent.[15] The shipper

---

[12] This point is emphasized by Jules Valéry, "Les Contrats d'assurance au moyen âge," *Revue générale du droit, de la législation et de la jurisprudence*, XXXIX (1915), 472 f.

[13] The case would be different if part of the cargo was sacrificed as a ransom in order to dissuade pirates from attacking and destroying the ship. In such a case there would be general average and the loss would have to be shared by all those concerned in the venture.

[14] Some sea loans of Palermo, dating from 1287 to 1338, contain this clause. Riniero Zeno, *Documenti per la storia del diritto marittimo nei secoli XIII e XIV* (Turin, 1936), documents Nos. 10, 96, 97, 101, 103, 104, and 175. Examples as early as 1248 appear in the records of the Marseilles notary Almaric, first published by Louis Blancard, *Documents inédits sur le commerce de Marseille au moyen âge*. Valéry ("Les Contrats d'assurance," p. 477) gives the Latin text with a French translation of one of these Marseilles sea loans.

[15] Zeno, *Documenti*, p. lxxxvi.

Downloaded from https://www.cambridge.org/core. Newcastle University, on 26 Jan 2017 at 03:10:13, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/S0022050700112975

remained his own insurer for the remainder. Insurance loans were thus not satisfactory for the purpose of covering the risk completely. They were usually granted under the form of a *mutuum gratis et amore,* although there can be no doubt that the shipowner usually advanced less to the shipper than the latter was expected to repay. This premium could also be concealed by raising the freight charges or by adding something to them for "insurance," as in a Palermo document of 1340 cited by Adolf Schaube.[16]

One of the earliest known examples of an insurance loan granted by a shipowner to the charterer of his ship is found in two deeds drafted by a notary in Palermo on May 12, 1287.[17] On this day, two merchants of Barcelona sold to a Florentine named Vanni Chiandono a certain quantity of wine which was already loaded aboard a ship ready to sail from Palermo to Tunis. The parties agreed that the seller would assume one third, and the buyer, two thirds, of the risk of transportation to the seaport of Tunis or Aquilata.[18] From then onward all risks were taken over by the buyer. On the same date another agreement was concluded between the buyer and Leonus de Vinders, owner of the vessel carrying the wine. According to this agreement, the freight charges, amounting to 300 units of gold (*miri doppi d'oro*), were payable at destination upon safe arrival of the ship. In addition the shipper confessed to having received from the shipowner or master a sum of 320 units of gold *ex causa mutui ad risicum maris et gentium,* that is, as a *mutuum* subject to the risks of the sea and of men of war. This loan together with the freight charges was due ten days after the vessel's safe arrival at the seaport of Tunis. Since the shipper did not accompany his goods, he must have had a representative in Tunis who could pay the charges. As security for the loan and the freight charges, the borrower pledged the cargo of wine, which apparently was to be released by the shipowner only if the contract was fulfilled.

---

[16] Schaube, "Die wahre Beschaffenheit der Versicherung," *op. cit.*, pp. 479–81. According to a contract dated 1340, the shipowner, upon safe arrival of the goods, was entitled to repayment of the loan made *gratis et amore* and to a certain sum *pro naulo et securitate* ("for freight and insurance"). Schaube believed that the term *securitate* in this context refers not to "insurance" but to an "assurance" given by the captain that specially good care would be taken of the cargo of grain. But according to the sea laws the captain was already bound to take proper care of the cargo. It seems logical to believe that the word *securitate* refers to the risk assumed by the shipowner in lending money to the shippers and in making its repayment contingent upon the safe arrival of the ship. Apparently a distinction was made between charges for transportation and charges for the assumption of risk. Cf. Zeno, *Documenti,* p. lxxxvii.

Downloaded from https://www.cambridge.org/core. Newcastle University, on 26 Jan 2017 at 03:10:13, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/S0022050700112975

Until recently no examples of insurance loans prior to 1317 were known.[19] The whole series of contracts, covering the period from 1287 to 1337, published by Riniero Zeno, from the Palermo notarial records, pushes this date back to 1287 and shows that insurance loans were far from being uncommon.[20]

These Palermo contracts are interesting examples of that type of covenant which paved the way to real insurance (that is, risk assumed by third parties) but cannot be considered as such. The purpose of all agreements of that type was to shift the burden of the sea risk in whole or in part from one party to another: for example, from the buyer to the seller, from the shipper to the shipowner, or from the borrower to the lender, but not yet from the owner to third parties, later called underwriters.

III

Nobody knows exactly how or when real premium insurance came into existence. It is very doubtful that it developed directly out of any of the earlier contracts which shifted the risk from one party to another. The most plausible explanation is that, early in the fourteenth century, the rising sedentary merchants invented a new type of contract, when they discovered that none of the existing forms were quite satisfactory as a means of transferring and dividing sea risk. The merchants could hardly fail to learn from experience that goods arrived safely in most instances and that only a small percentage of all cargoes was lost. It was, therefore, possible to measure the risk with a fair degree of accuracy. Elaborate statistical information was not necessary, and it is not surprising that the underwriting of marine insurance became a sound business long before actuarial science gave the same standing to life insurance.

There are references to *securitas* or insurance in a number of documents of the early fourteenth century. The trouble is that the significance of the word *securitas* is not clear from the context. In the Middle Ages, this word

[19] This contract of 1317 was an isolated example found by Schaube in the Pisan archives. It is described in his third article, "Der Versicherungsgedanke in den Verträgen des Seeverkehrs vor der Entstehung des Versicherungswesens," *op. cit.*, pp. 155 f. Before the discovery of this Pisan document, the only known examples of insurance loans made by shipowners were found in some later Sicilian documents published by Ferdinando Lionti, "Le Società dei Bardi, dei Peruzzi e degli Acciaiuoli in Sicilia," *Archivio storico siciliano*, XIV (1889), 189–230. They were discussed by Schaube in the first of his three well-known articles on the origins of marine insurance, "Die wahre Beschaffenheit," *op. cit.*, pp. 475–79.

[20] Zeno, *Documenti*, Nos. 44, 46, 57, 74, 111, 133, 140, 148, 150, 161, 162, 167, 168, 171, 173, and 183.

Downloaded from https://www.cambridge.org/core. Newcastle University, on 26 Jan 2017 at 03:10:13, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/S0022050700112975

had not yet acquired a precise technical meaning but referred to all kinds of "assurances," safe conducts, or sureties. For instance, bribes would be paid for someone's "assurance" that a ship would not be attacked by privateers with whom this person had influential connections. Of course, payments for "assurances" of this kind are very different from insurance premiums.[21] The ambiguity of the words *securitas, risicum,* and other similar expressions in early texts has given rise to a great deal of rather fruitless discussion.

One of the controversial texts is a passage in a statute, promulgated in 1318, regarding the port of Cagliari on the island of Sardinia. According to this statute, brokers were restrained from meeting ships in the outer harbor in order "to charter or to insure them" (*per naulegare u sigurare*).[22] It has been argued that the word *sigurare* as found in this contract does not mean "to insure," but *may* mean "to secure." What "to secure" may refer to has not been clarified, however. Perhaps the purpose of the statute of Cagliari was to prevent ship brokers from forestalling competitors by racing to incoming ships in order to "secure" their business. Today, a ship broker still earns a living by representing shipowners in a port of call and by securing freight for their ships. The statute of Cagliari was probably a municipal ordinance that was designed to promote standards of fair competition among the ship brokers. Such an interpretation would at least make sense. It seems to me that the other interpretations which have been given are rather far-fetched and improbable.[23]

Another discussion has raged around some entries in the account books of the Del Bene firm of Florence (1319–1320).[24] One of these entries relates to a shipment of Flemish and French cloth which was bought at the fairs of Champagne by the famous Bardi Company, acting as commission merchants for the Del Bene firm. According to an agreement, the Bardi undertook to deliver the cloth in Pisa at their own risk but at the buyer's expense. For assuming this risk, the Bardi charged 8.75 per cent extra on the total cost of the goods delivered in Pisa. As some of the cloth had been water-soaked, the Bardi agreed to a deduction for the damage. The extra charge of 8.75 per cent is called *rischio* in the accounts of the Del Bene firm. While

[22] Bensa, *Il Contratto,* p. 55.

[23] *Ibid.,* pp. 55–57; Schaube, "Die wahre Beschaffenheit," *op. cit.*, pp. 50–55; Checchini, "I Precedenti e lo sviluppo storico del contratto di assicurazione," *op. cit.*, pp. 71 f.

[24] The text of these entries was first published by Bensa, *Il Contratto,* pp. 183–89.

Downloaded from https://www.cambridge.org/core. Newcastle University, on 26 Jan 2017 at 03:10:13, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/S0022050700112975

the word *rischio* had admittedly several meanings, it clearly refers in that context to a special charge or *premium* for the assumption of a risk.[25]

There is a document which has created even a greater stir than either the statute of Cagliari or the Del Bene account books. This is the much discussed Grosseto document of 1329.[26] It is a receipt in notarial form given by a Genoese shipowner, Ottobono de Marini, to the representative of the Acciaiuoli Company, a Florentine firm of merchant-bankers, for (1) 1,450 florins representing freight charges from Tunis to Grosseto, a former port north of Civitavecchia, (2) 2,450 florins representing "insurance and risk" (*pro securitate et risico*), and (3) 272½ florins in the name of Gaspar de' Grimaldi, knight. There is no discussion about the first of these three items. And regarding the third item, there seems to be general agreement that it is the price of a safe-conduct obtained through Grimaldi from some Ghibelline privateers who were combing the Tyrrhenian Sea for Guelf shipping. Since the shippers were Florentine Guelfs, their cargo was in danger of being seized, if intercepted by the Ghibellines. All the discussion centers around the second item of fl. 2,450 for *securitate et risico*. Some believe that this amount is really an insurance premium. The fact that this supposed premium is so high is explained by the state of war and the presence of the Ghibelline fleet.[27] Others reject this theory and contend that the sum of 2,450 florins refers to the repayment of an insurance loan made by Ottoboni de Marini, shipowner, to the Acciaiuoli Company, shippers.[28] They point out that insurance premiums are always payable in advance and not after safe arrival of the insured cargo at the port of destination. Another argument is that a premium of 2,450 florins is improbably large, even if one considers the danger from privateers and the high value of the cargo, which was composed of leather, wool, and lamb fells. Both of these conflicting theories are plausible on the basis of what is known. I believe that it is impossible to disprove either theory without more information than is now available.

---

[25] Schaube dissents even from this interpretation ("Die wahre Beschaffenheit," *op. cit.*, pp. 494–501), but I am inclined to believe that in this instance he is hypercritical.

[26] This document was first published by Bensa, *Il Contratto*, pp. 190 f.

[27] This is the opinion of Giuseppe Valeri, "I Primordi dell'assicurazione attraverso il documento del 1329," *op. cit.*, pp. 600–41. He dissents from everyone else in believing that the third item refers to reinsurance rather than to some kind of safe-conduct secured through the offices of Grimaldi. Checchini agrees with Valeri concerning the meaning of the second item but with Schaube and others concerning the third item.—"I Precedenti," *op. cit.*, pp. 73–79.

[28] This opinion is represented by Schaube, "Die wahre Beschaffenheit," *op. cit.*, pp. 40–47, 504–9. André E. Sayous criticizes Schaube for displaying too much ingenuity and for being overcritical.—"L'Histoire universelle du droit commercial de Levin Goldschmidt et les méthodes commerciales des pays chrétiens de la Méditerranée aux XII^e et XIII^e siècles," *Annales de droit commercial français, étranger et international*, XL (1931), 314–16.

Downloaded from https://www.cambridge.org/core. Newcastle University, on 26 Jan 2017 at 03:10:13, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/S0022050700112975

Until recently no insurance policies in undisguised form earlier than 1384 were known to be extant. The publication by Zeno of several premium-insurance contracts drawn up in Palermo in 1350 by the notary Stefano de Amato shows that marine insurance had already reached the stage of maturity at a much earlier date than was hitherto believed. Since Palermo was one of the less important commercial centers, it is possible that marine insurance was practiced before 1350 in more important centers, such as Pisa, Florence, and perhaps Venice.

The first of the Palermo insurance policies is dated March 15, 1350. From its contents it appears that a Genoese merchant, Leonardo Cattaneo, underwrote or insured (*assecuravit*) a shipload of wheat, belonging to one Benedict de Protonotaro of Messina, up to the amount of fl. 300 for a voyage from Sciacca, on the island of Sicily, to Tunis. Leonardo Cataneo declared that, from the time of the ship's sailing from Sicily until its safe arrival in Tunis, he would assume all risks arising from an act of God or of men and from the perils of the sea (*omni risicum, periculum et fortunam Dei, maris et gentium*). The sum of fl. 300 was due one month after receiving "certain" news of the cargo's loss. If the loss was only partial, the insurer's responsibility would be commensurate with the extent of the damage. The premium was 54 florins or 18 per cent. It was clearly stated that the contract was concluded for purposes of insurance (*ex causa assicurationis*) and that the underwriter had received from the insured the 54 florins "for that insurance" (*pro qua securitate*).[29]

The second insurance policy published by Zeno is of the same date as the first and also concerns a shipment of grain from Sicily to Tunis, but on another ship. In addition to covering this risk on the outbound voyage, the insurers were answerable in case of disaster to the return cargo which was to be bought with the proceeds from the grain. The premium for the round-trip voyage was 4½ ounces of gold on an insurance of 30 ounces of gold or 15 per cent. It is not clear why the premium was lower for the round trip than for the single voyage from Sicily to Tunis; perhaps one vessel was more seaworthy than the other.[30]

A third insurance policy resembles the second and also relates to a round-trip voyage between Sicily and Tunis. The premium this time is 20 per cent. The third contract stipulates that the destination of the insured cargo may not be changed except for reasons of emergency.[31]

A fourth contract published by Zeno does not concern the insurance of a cargo but that of the ship itself with all its tackle and apparel (*eius guarnimentis et corredo*). This contract also covers the freight charges which were usually payable at destination and which the shipowner would not be able to collect if the loss of his ship prevented the delivery of the cargo to the consignees. The premium stipulated in the policy is 14 per cent for a voyage from Palermo to Tunis via Sciacca and back to Palermo with calls at Mazzara and Trapani. No deviations were allowed except in case of emergency.[82]

The Palermo insurance contracts are significant because the nature of the agreement is stated in plain and straightforward language. Such is not the case in some contemporaneous Genoese contracts where the real purpose of the contract is cloaked in the disguise of a *mutuum gratis et amore*, that is, a loan without interest. For example, in one contract dated October 23, 1347, the insurer named Giorgio Leccavello acknowledged having received a sum of £107 Genoese from one Bartolomeo Basso *in mutuo gratis et amore* and promised to repay this amount unless a cog named Santa Clara, ready to sail from Genoa, reached safely the island of Majorca. In other words, if the vessel arrived safely at its destination the contract would be null and void. It was also agreed between the parties that the contract would be voided if the Santa Clara did not sail from Genoa or if it accomplished another voyage and was found within six months to be safe in any other part of the world.[83] The contract is deceptive in that the insurer, it is evident, never borrowed any money. It was, therefore, necessary to stipulate that he would not avail himself of the exception *non numerate pecuniae*, which allowed the borrower to repudiate any obligation by taking an oath that he had not received the full amount specified in a loan contract, in other words, that the contract was usurious. In contrast to the Palermo contracts, the amount of the premium is not stated.

The contract concerning the cog Santa Clara is not the only one of its kind. It was a common practice in Genoa to disguise an insurance contract under the form of a loan contract. In the case of a shipment of alum from Genoa to Sluys, the seaport of Bruges, the insurer was a merchant named Niccolò Cattaneo. By a notarial act dated March 9, 1350, he acknowledged having received from Matteo Ardimento an amount of £250 Genoese *in mutuo gratis et amore* and promised to repay this amount with the reservation that this obligation would be canceled if the shipment of alum was safely unloaded in the seaport of Sluys. It was further provided that, if the alum was

[82] Zeno, *Documenti*, pp. 233–34, No. 194.

[83] The text of this contract was published by Bensa, *Il Contratto*, pp. 192–93, Doc. No. III.

Downloaded from https://www.cambridge.org/core. Newcastle University, on 26 Jan 2017 at 03:10:13, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/S0022050700112975

transshipped in Lisbon, the insurer would bear all risks.[34] This provision alone shows clearly that the whole purpose of the contract was the assumption of certain risks and not the acknowledgment of a debt, as superficial reading might suggest.

The form of these early Genoese insurance contracts naturally reminds the reader of the sea loan, also disguised as a *mutuum gratis et amore*. In both cases, it was stated that the loan was made without interest and that the borrower had actually received the full amount stipulated in the contract, although neither statement was true. In both cases, the loan was to be repaid only under certain conditions. But here the similarity ends. In the sea loan, it was the *insured* who promised to repay, if a certain ship arrived safely, a sum of money of which he had actually received the greater part. In the Genoese insurance contract, the situation was reversed. It was the *insurer* who promised to repay a sum of money, which he had *not* actually received, if a certain ship did *not* arrive safely. Thus the Genoese contract represents a complete reversal of the earlier relations between insurer and insured: instead of the insured repaying to the insurer a real loan, the insurer promised to pay the insured a certain sum of money in case of sea disaster. Here we have real insurance, however much disguised under the form of a loan. The omission of any reference to a premium was unimportant. The premium was probably handed over by the insured to the insurer before the contract was drawn up by the notary. The insured needed no receipt because nothing in the contract would permit the insurer to claim the premium anew. The insurer had the premium in his pocket, hence he needed no written evidence of its payment.

Historians have asked themselves why the Genoese notaries persisted in cloaking new forms in an old garb. Some have suggested that the Genoese notaries and merchants were more subservient to the teachings of the church with regard to usury than those of other commercial centers.[35] But I should hesitate to give the Genoese a certificate of piety and subservience to the church. It is much more likely that the insurance contract was developed independently in several Italian seaports at about the same time, but that there was at first no uniformity in business procedure and legal forms.[36] This

[34] Published by Bensa, *Il Contratto*, pp. 196–97, Doc. No. VI. For other examples, see Docs. Nos. IV, V.

[35] See Schaube, "Der Uebergang vom Versicherungsdarlehn," *op. cit.*, p. 497, and the comments of Valeri, "I Primordi," *op. cit.*, pp. 629–30.

[36] Valeri ("I Primordi," *op. cit.*, p. 629) credits the Florentines with the invention of insurance, but this is an assertion difficult to prove, since the earliest Florentine insurance policies are later than the Genoese and Palermo insurance contracts in notarial form. Moreover, in the Palermo contracts of premium insurance published by Zeno, the insurers are in all four cases Genoese.

Downloaded from https://www.cambridge.org/core. Newcastle University, on 26 Jan 2017 at 03:10:13, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/S0022050700112975

explanation is the more plausible in that local differences existed also in fields other than insurance. For example, the Genoese continued to use Latin much longer than either the Venetians or the Florentines, not only in drafting contracts but also in bookkeeping and in writing business letters of an informal character.

After 1365 the *mutuum* or pseudo-loan form of insurance contract became less and less popular in Genoa, but still insurance was not treated as a contract *sui generis*. Instead insurance was dressed up as a contract of purchase and sale (*emptio venditio*) in which the insurer appeared as the buyer and the insured as the seller. The purchase was not unconditional since the insurer promised to buy the insured goods *only in case they did not arrive safely* at a certain port.[37] This type of contract had the advantage of giving the insurer after payment an unquestionable title to the insured goods if they were salvaged after having been lost.[38]

There is perhaps another reason for the shift from the *mutuum* (pseudo-loan) to the *emptio venditio* (pseudo-sale) form of contract. A *mutuum* was always a contract that laid itself open to the suspicion of usury. It is possible that some Genoese insurers sought to evade their obligations by pleading in ecclesiastical courts the exception *non numerate pecuniae* in spite of the fact that they were bound by contract not to avail themselves of this exception.[39] At any rate, the Genoese Doge Gabriel Adorno, by a decree promulgated in 1369, tried to put an end to the evasion of contractual obligations by frivolous litigation in ecclesiastical or other courts. The Doge's decree applied especially to matters of insurance and exchange. Merchants who refused to carry out the terms of their contracts were threatened with a fine of 10*s*. for every pound the payment of which was called into dispute.[40] Whether or not the Doge's decree was effective is a matter of conjecture.[41] Insurance contracts in the form of a *mutuum* did not disappear entirely after 1369.[42] But the Genoese jurisconsult Bartolomeo Bosco defined the

[37] For examples, see Bensa, *Il Contratto*, p. 200, Doc. No. VIII (contract of July 12, 1370) and p. 225, Doc. No. XVII (November 16, 1426).

insurance contract as an *emptio venditio* subject to the resolutive condition of safe arrival.[43] Even for life insurance the Genoese used a form of contract resembling a sale; examples appear as late as the fifteenth century.[44] There can be no doubt that this form was preferable to the *mutuum* as long as insurance was not recognized by the jurists as a contract *sui generis*.[45]

IV

After premium insurance was well established in business practice, there were sharp differences in the way the contracts were drawn. In Genoa, as we have seen, it was customary to have notaries prepare insurance contracts. At first this practice made it necessary to draw up a separate contract for each underwriter who agreed to take a share in a given risk.[46] Later on, this cumbersome practice was simplified by the notary's making only one contract which included and listed all the underwriters who had a share in the risk.[47]

The Genoese and Sicilian practice—still found in Antwerp in the sixteenth century—of having notaries draw up insurance contracts was not followed in other seaports like Pisa and in interior cities like Florence. In those two commercial centers, insurance policies were made out by brokers who passed them around to merchants willing to underwrite part of the risk. Thus, a Florentine insurance policy, dated July 10, 1397, found in the Datini Archives, bears the names of eleven underwriters who, together, were answerable for 2,100 florins. The size of individual subscriptions in this policy ranged from 100 to 300 florins.[48] It was not always easy to collect subscriptions. According to another Florentine insurance policy taken out by Francesco Datini, it took the broker almost a month (April 26

[43] Bensa, *Il Contratto*, p. 73; Schaube, "Uebergang vom Versicherungsdarlehn," *op. cit.*, p. 495.

[44] For examples, see Bensa, *Il Contratto*, pp. 228–29, Doc. No. XIX (April 10, 1427); pp. 232–33, Doc. No. XXII (January 5, 1428); pp. 234–35, Doc. No. XXIII (November 15, 1430).

[45] The jurists of the sixteenth and seventeenth centuries considered the insurance contract as a *contractus innomatus*, that is, a special contract not named in Roman law. Zeno, *Storia del diritto marittimo*, pp. 169 f.

[46] This observation applies both to the four Palermo contracts published by Zeno and the early Genoese contracts published by Bensa.

[47] See Bensa, *Il Contratto*, pp. 228, 232–35, 236.

[48] This policy for insurance on six bales and one fardel of silk veils, shipped from Motrone to Aigues Mortes, was published in Bensa, *Il Contratto*, pp. 217–20, Doc. No. XIV, and reprinted in Florence Edler [de Roover], *Glossary of Mediaeval Terms of Business, Italian Series, 1200–1600* (Cambridge: The Mediaeval Academy of America, 1934), pp. 34–35. Bensa misread the florin sign as that of the scudo, an error I discovered only in 1938, while photographing the original document in the Datini Archives. Throughout the contract "scudi" should read "florins." Other errors in Bensa's transcription are less serious.

to May 20) to find underwriters for a risk of 1,250 florins on wool and leather shipped from Majorca to Venice in 1396. Seven merchants signed up and then canceled their subscriptions with the result that the broker had to approach other merchants. Finally the risk was covered by fourteen different underwriters with subscriptions ranging from 50 to 200 florins.[49] When the amount of the risk was small, policies were underwritten by one to four merchants. Individual underwriters rarely answered for more than 200 florins.

Among the many insurance policies in the Datini Archives, which contain the business records of Francesco Datini (*ca.* 1335–1410),[50] there are two different forms of policy: one popular in Florence and the other in Pisa. There is no essential difference between the two types, but they vary somewhat in wording and arrangement. For instance, in the Pisan policies, the names of the insurers are mentioned twice: once at the beginning and again at the end of the contract, where the subscriptions appear. The Florentine policies, on the contrary, do not begin with the list of the underwriters. Their names are mentioned only once—in the subscriptions at the bottom of the instrument.

The Florentine and Pisan brokers wrote the policies in Italian, whereas the Genoese and Palermo policies are in Latin, the language used by notaries. The Florentines usually state first the date of the contract, the name of the insured, the sum insured, the nature of the insured goods (or the name of the insured vessel), the name of the vessel on which they are loaded, the name of the master, the port of shipment or of sailing, and the port of destination.[51] Sometimes there is an additional statement to the effect that the insurers are entitled to keep one half of one per cent of the sum insured, if the vessel should sail without having on board the goods described in the policy.[52] The contract usually stipulates that the insurers agree to assume the risks which "are of God, of the sea, of men of war, of fire, of jettison, of detainment by princes, by cities, or by any other person, of reprisals, of arrest, of whatever loss, peril, misfortune, impediment or sinister that might

[50] Bensa, *Francesco di Marco da Prato,* is a biography of Datini, a native of Prato (Tuscany), who was one of the most prominent merchant-bankers of his time. The only study in English is Robert Brun, "A Fourteenth-Century Merchant of Italy: Francesco Datini of Prato," *Journal of Economic and Business History,* II (1930), 451–66.

[51] For the text of such a contract, see the references in note 48.

[52] This clause is found, e.g., in a policy of May 16, 1396, relating to a shipment from Venice to Majorca: "E se lla detta roba non si charichase in sulla detta nave, che gli asichuratori ebino s. 10 a oro per cento [fiorini], si veramentte che lla detta nave facia il detto viaggio."—Archivio Datini, No. 1159, Assicurazioni marittime. Cf. a similar clause in the Pisan contract of 1384, Bensa, *Il Contratto,* p. 211.

Downloaded from https://www.cambridge.org/core. Newcastle University, on 26 Jan 2017 at 03:10:13, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/S0022050700112975

occur, with the exception of packing (*stiva*) and customs," until the insured goods are safely unloaded at destination.[53]

The contract goes on to state that the sum insured is due two months after receiving certain news of any mishap or disaster. If no tidings at all are received, the cargo or the ship is presumed lost after six or more months (depending upon the length of the voyage) from the date of the contract.[54] Should the cargo arrive safely after payment of the insurance in default of news, then the sum paid would have to be refunded by the insured to the insurers.[55] The safe arrival of the insured goods frees the insurers from all obligation. In some contracts, but not in all, barratry of the master is explicitly mentioned among the risks assumed by the insurers. From the enumeration given above, it is evident that defects in packing and confiscation by customs officials for faulty declaration or nonpayment of duties are not covered by medieval insurance policies. As today, thefts committed by the master or the crew were not covered by insurance, either, but gave rise to claims against the owners of the vessel or to a refund on freight charges.[56] In the Middle Ages more ships were lost through seizure by pirates or privateers than through storm, bad weather, collision, or other accidents. Since the high seas were unsafe because of latent warfare and piracy, insurance policies always covered the *risicum gentium* as well as the *risicum maris*. Today, according to the York-Antwerp Rules, the risk of war is not covered by marine insurance unless expressly specified.

Because medieval policies covered losses due to war as well as those due to other accidents, and because shipwrecks in the Middle Ages were comparatively more frequent than today, it is not surprising that insurance premiums were much higher then than they are now. The rate of the premium varied not only according to distance but also according to the seasons of the year (whether summer or winter), the state of war or peace, the reported presence or absence of pirates along the sea lanes, the type of

[53] *Ibid.*, pp. 217–18; Edler, *Glossary*, p. 34.

[54] Six months for a voyage from Motrone, the seaport of Lucca, to Aigues Mortes (Bensa, *Il Contratto*, p. 218) but ten months for a voyage from Porto Pisano to Barcelona or from Venice to Valencia (Archivio Datini, No. 1159, Assicurazioni marittime).

[55] Today, the insurers, having acquired title to the insured goods, would simply sell them and recover what they paid from the proceeds of the sale.

[56] Large navigation companies today have a special claims department which handles the claims of shippers for shortages. If a bill of lading mentions ten boxes but only nine are unloaded at destination, the carrier is responsible, unless he can prove that the missing box was lost by the perils of the sea. Gerard de Malynes observes in connection with theft on shipboard by members of the crew that "the master of the ship is to answer for that and to make it good so that the assurances are not to be charged with any such losse which is sometimes not observed."—*Lex mercatoria* (1st ed.; London, 1622), Part I, chap. xxv, p. 151.

Downloaded from https://www.cambridge.org/core. Newcastle University, on 26 Jan 2017 at 03:10:13, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/S0022050700112975

vessel (whether a galley or a cog), and other circumstances.[57] As indicated by entries in a memorandum book kept by Francesco Datini's branch office in Pisa, the rate was 8 per cent for a voyage from Cadiz to Sluys or Southampton (*Antona*), 3 or 4 per cent for voyages from Peñiscola (a small port between Barcelona and Valencia) to Porto Pisano, 4 per cent for voyages from Porto Pisano to Naples or to Tunis, and 4 or 5 per cent for voyages from Porto Pisano to Barcelona or to Palermo. All these rates applied to marine insurance contracted in August and September 1384.[58] By the terms of a policy dated May 10, 1396, the rate was only 3 per cent, instead of the higher rates in 1384, on a shipment from Porto Pisano to Barcelona. In December 1399, 7 per cent was charged for insuring nine bales of "grain" (a red dyestuff) shipped from Valencia to Venice.[59] Uzzano, the author of a famous manual for merchants written in 1442, states that the premium from London to Pisa varied between 12 and 15 per cent, and "occasionally even higher when there were rumors about dangerous corsairs."[60] According to the account book of Jacomo Badoer, a Venetian merchant residing in Constantinople in the 1430's, insurance rates were 6 per cent for a voyage from Constantinople to Venice and from 8 to 10 per cent for the shorter trip from Constantinople to Ancona.[61] Distance, therefore, was by no means the only factor that determined the rate of an insurance premium.

The private account books of Bernardo Cambi, a Florentine merchant of the fifteenth century, contain a large number of entries relating to marine insurance.[62] Cambi resided in Bruges from 1435 until 1450, when he returned to Florence. Both before and after his return to his native city, he was active as an underwriter. A glance at Table 1, based on entries in his account books, shows that insurance rates were definitely lower on shipments sent by the

[61] Vittorio Alfieri, *La Partita doppia applicata alle scritture delle antiche aziende mercantili veneziane* (Turin, 1891), p. 97.

[62] The author had the privilege of examining the Cambi account books in 1938. At that time, these records were in the possession of Mr. Otto Lange of Florence. Later they became the property of Prince Piero Ginori Conti. The Cambi records include two ledgers of Bernardo Cambi, one for the years 1435–59 and the other for 1470–90. An interesting comparison is that between the rates in Cambi's records and those listed by Malynes in his *Lex mercatoria* (1622), Part I, chap. xxiv, p. 150.

Downloaded from https://www.cambridge.org/core. Newcastle University, on 26 Jan 2017 at 03:10:13, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/S0022050700112975

galleys than on those moved by other vessels.[63] The most important galleys, about 1470, were the Venetian, the Genoese, and the Florentine galleys of the Levant and of the Ponent, but the account books of Cambi also refer to insurance taken out on the Catalan, the Burgundian, and the Ferrandine galleys.[64] Underwriters did not consider these galleys as safe as those of Florence or Venice and charged slightly higher rates, but still less than when goods were shipped in a nef (*nave*), a carrack, a caravel, or other craft.[65] The reason why underwriters discriminated in favor of the galleys was apparently that they were larger, swifter, better manned, usually sailed in consort, and were less likely to be attacked by pirates or privateers than ordinary medieval trading vessels.[66] While insurance rates were lower, freight charges were higher on the galleys than on other vessels.[67] The same is true today: a shipper pays less for freight and more for insurance on an old tramp steamer than on an up-to-date motor vessel operated by a regular line.

Besides the galleys, the account books of Bernardo Cambi mention other vessels which made regular trips, for example, "the Portuguese nef which brings malmsey to Flanders."[68] But the rate was rather high on this ship: 11 per cent for the voyage from Madeira to Sluys, the seaport of Bruges.

Insurance rates were sensitive to bad news, as is shown by an excellent example in the Cambi records. The two Burgundian galleys enjoyed good standing with the underwriters, who charged only 4 per cent for the trip from Zeeland to Porto Pisano, according to an entry dated April 26, 1473.[69] Unfortunately, while crossing the North Sea from Flanders to England, one of the two galleys was seized on this very trip by the Danzig privateer, Paul Beneke.[70] The other galley escaped and called at Southampton to load addi-

[63] The list given in Table 1 is selective and is far from including all the Cambi entries relating to insurance.

[64] The Burgundian galleys were two galleys built for the duke of Burgundy and operated by the Medici under the Burgundian flag, that is, the flag of the Low Countries bearing at that time a St. Andrew's cross raguly. The Ferrandine galleys belonged to, and flew the flag of, King Ferrando of Naples.

Portuguese nef	Sluys	Lisbon	8.0	September 28	1454
Catalan galleys	Sluys	Barcelona	5.0	August 8	1442
Venetian galleys	Sluys	Palermo	4.0	May 2	1473
Venetian galleys	Sluys	Palermo	4.5	October 23	1475
Burgundian galleys	Sluys	Porto Pisano	5.0	May 4	1470
Four English and/or Flemish nefs	Sluys	La Rochelle	10.0	October 30	1454
Flemish nef	Sluys	La Rochelle	10.0	January 14	1455
Venetian galleys	Southampton	Majorca	4.0	September 22	1470
Genoese nef	Southampton	Porto Pisano	10.0	April 15	1454
Genoese nef	Southampton	Porto Pisano	9.0	June 1	1470
The Burgundian galley†	Southampton	Porto Pisano	6.0	July 10	1473
Genoese nef	Southampton	Porto Pisano	7.0	June 18	1473
Spanish nef	Tortosa	Porto Pisano	7.0	May 9	1472
Venetian galleys	Valencia	Porto Pisano	2.0	September 1	1472
Catalan nef	Venice	Sluys	11.0	December 31	1454
English nef	Zeeland	London	4.0	October 18	1454
Flemish nefs	Zeeland	London	4.0	September 1	1454
Genoese nef	Zeeland	Barbery coast	8.0	January 16	1454
Burgundian galleys	Zeeland	Porto Pisano	4.0	April 26	1473
Biscayan caravel	Zeeland	Valencia	11.0	June 1	1470

* The entry in the Cambi ledger relating to this item reads as follows: "1472, Sichurtà deon avere..... E dì 12 d'ottobre fl. 5 s.10 auto dal bancho per sichurtà di fl. 50 sulla nave portoghallese che porta le malvagie in Fiandra, c. 50..... fl. 5 s.10."

† The second Burgundian galley had been captured by a Danzig privateer while crossing from Zeeland to England.

Downloaded from https://www.cambridge.org/core. Newcastle University, on 26 Jan 2017 at 03:10:13, subject to the Cambridge Core terms of use, available at https://www.cambridge.org/core/terms. https://doi.org/10.1017/S0022050700112975

tional cargo for Italy. As the confidence in the Burgundian galleys was badly shaken, the insurance rate for goods carried by the uncaptured galley from Southampton to Porto Pisano jumped from 4 to 6 per cent.[71] Incidentally, the Cambi ledger also records the payment of the insurance on the captured galley. No further references are found to the second galley, which was shipwrecked the following year (1474).

Bernardo Cambi, as his account books clearly show, was not specialized as an underwriter. He combined this activity with foreign banking and investments in mercantile ventures. Even after his return to Florence in 1450, most of the underwriting was done by his representatives in Bruges.[72] In the 1470's his insurance business in Florence apparently became more important. Collected premiums were credited to an account "Insurance" (*Sicurtà*). Indemnities paid out were charged to the same account. Its balance was transferred from time to time to "Profit and Loss." The Venetian merchant Jacomo Badoer followed the same system for keeping a record of his transactions as an underwriter. Expenses for the recovery of pillaged goods incurred by the insurer, after payment of the insured's claim, were also charged to the debit of the Insurance Account.[73] The proceeds from the sale of goods salvaged were probably placed to the credit of the same account. This would be the logical procedure, although no actual example was found in extant records.

Despite the high premiums that were charged by underwriters, the insurance business was not always profitable. According to the accounts of Cambi, he paid out more in claims than he received in premiums. Perhaps he had bad luck. At any rate there is no ground for the opinion that premiums in the Middle Ages were excessively high, considering the risk. The insurance business was probably very competitive and the brokers strove to secure for their clients the cheapest rate possible.

Although insurance rates were not excessive, they seemed high to the insured. From his point of view, they represented an appreciable addition to cost and might wipe out his entire profit if selling prices were low. Merchants, therefore, were greatly tempted to take a chance rather than to cover their shipments by insurance.[74] Some Venetian merchants deemed it unnec-

[71] Cambi Ledger, 1470–90, fol. 66r: "E dì 10 di luglio fl. 6 da' Medici per sichurtà di fl. 100 larghi sulla ghalea di Borghongna d'Antona a Pisa, portò Francesco Tedaldi, c. 67 . . . . fl. 6." Note that the entry uses the singular: "la ghalea."

essary to take out insurance on goods carried by the state galleys. They were considered so safe that the only precaution that the merchants took was to limit the sum which they would "adventure" in one galley. Shipments were divided as much as possible among all the galleys that made up a fleet. This policy of reducing expenses by cutting down on insurance was not followed by all merchants. Francesco Datini, for example, gave instructions to his agents abroad that they should not ship anything overseas that was not properly insured.[75] According to the terms of a partnership agreement concluded in 1455, the branch manager and junior partner of the Medici bank in Bruges was bound by contract to insure all shipments overseas for their full value. However, when sending goods with the Venetian or Florentine galleys, he was permitted to adventure in one bottom £60 groat but not more.[76]

In connection with marine insurance, there are several references in medieval records to overland insurance. One such contract of 1405 provides for the coverage of all risks both by sea and by land from the time that the bale is loaded in Florence "on mules or other beasts of burden" up to the time that it is safely unloaded from a galley or galliot in the port of Genoa. In addition to the acts of God, the perils of the sea, and the danger from men of war and pirates, the policy mentions also certain specific risks of overland transportation—robbery, and damage by rain, river, or lake water. Defective packing, customs, and tolls (*passagi*) are excepted from the risk covered by the insurance.[77] Another reference to land insurance occurs in the text of a Genoese partnership agreement dated August 16, 1424.[78] This agreement empowered one of the partners to underwrite all kinds of insurance "as well by sea as by land" (*tam in mari quam in terra*). The earlier of the two Cambi ledgers contains several references to overland insurance. In 1453, Bernardo Cambi insured several loads of merchandise sent from Bologna to Geneva in charge of Primo and his brother Jacopo, common carriers (*vetturali*). The premium was 3 per cent each time. In January 1454, Cambi's agents in Bruges received a premium of 2.5 per cent for insuring

[75] Bensa, *Francesco di Marco da Prato*, pp. 183 f. In 1401, a Venetian merchant wrote to Datini with reference to the galleys: ". . . . e niuno pensiero faremo di farvici assicurare" ("and we have no thought of insuring ourselves").—*Ibid.*, p. 184, n. 1.

merchandise that was sent overland from Lille, in French Flanders, to Geneva.[79]

Cambi himself even insured goods that he bought on commission. For example, he insured a shipment of four pieces of velvet from Florence to Geneva which he had purchased on behalf of Francesco Fanucci of Paris. The goods were consigned to Jacopo di Pozzi and Company in Geneva to be sold at the Easter Fair there. Cambi charged 1 per cent for commission and 3 per cent for insurance from Florence to Geneva, so that he earned 4 per cent on the transaction, as the goods reached Geneva safely.[80]

Life insurance was not entirely unknown in the Middle Ages, but it was still in its infancy and was not clearly distinguished from pure gambling.[81] Entries in Bernardo Cambi's account books refer to "insurance" on the life of the pope (Nicholas V), of the doge of Venice (Francesco Foscari), and of the king of Aragon (Alfonso V).[83] Cambi gambled not only on the life of popes and kings, but also made bets on the winning horses of the Florentine *Palio,* and on the duration of a conclave and the election of a new pope (1455).[83] In Antwerp during the sixteenth century, wagers became a source of scandal and fraud.[84] As late as the seventeenth century, gambling on the death of rulers, the election of a pope, and the sex of expected children was common among merchants. The subject is even discussed by Malynes who devotes a chapter of his *Lex mercatoria* to merchants' wagers.[85]

The confusion between genuine insurance and wagers had an adverse effect on the development of marine insurance, which came to be considered as a game of chance. Insurance was taken out by people who had no interest in a given bottom and became a wagering device through the insertion of a

[79] Cambi Ledger, 1437–59, fol. 56[r]: "E dì 16 di gennaio [1454] fl. cinque per valuta di £1 di grossi che i nostri di Brugia me metterono in chonto, per sichurtà di £40 di grossi fatta per me a Bonora Oliviera da Lilla a Ginevra per terra a 2½ per cento, c. 107 . . . . fl. 5."

[80] *Ibid.,* fols. 56[r], 112[v]–113[r].

[81] Since there were no mortality tables, there was no way of computing probabilities. In Genoa masters sometimes insured pregnant slaves; and husbands insured pregnant wives. Bensa, *Il Contratto,* pp. 228, 237, Docs. XIX, XXV, dated 1427 and 1467. Insurance of pregnant slaves was also common in Barcelona. Premiums were often paid by the person responsible for the pregnancy. Robert Sydney Smith, "Life Insurance in Fifteenth-Century Barcelona," *The Journal of Economic History,* I (1941), 57–59.

[82] The wager was usually that the ruler would die within six months. Cambi received premiums varying from 3 to 8 per cent.

[83] Pope Nicholas V died on March 24, 1455. The new pope, Calixtus III, was elected on April 8. The entry in Cambi's account book is dated April 1. The bet was that the pope would be elected the same day. As he was not, Cambi kept the 6 per cent premium.

P.P.I. (policy proof of interest) clause.[86] This abuse led to the enactment of statutes for the purpose of curbing wagers first in Italy and later in the Low Countries.[87]

Another evil was that insurance was sometimes underwritten by persons who were not regular underwriters and who were not able to pay large indemnities, if they were called upon to carry out a contract. The case of Guiglielmo Barberi, an Italian merchant resident in Bruges, is a good illustration. Because of lack of ability or for other reasons, he was not very successful in business and had difficulties in meeting his obligations. In an effort to allay his troubles, he made the unfortunate decision to underwrite insurance in the hope of making an easy profit. Alas, things did not turn out as well as Barberi expected. He had insured a bale of cloth and a barrel of furs aboard a Catalan vessel bound for Barcelona. Before the ship reached its destination, it was attacked and plundered by pirates. In despair Barberi wrote to his correspondents in Catalonia begging them to search for the missing goods in all the ports and inlets along the coast from Barcelona to Valencia. He could ill afford to sustain any loss and he hoped that God would permit him to recoup this loss in some other way, "for even though I were to live a thousand years," he wrote, "never again would I underwrite insurance."[88]

Even the merchants who underwrote insurance regularly were sometimes irked by losses, although they must have realized that they could not go on collecting premiums without ever paying indemnities. Francesco Datini, in a letter to his agents in Majorca, stated that he had underwritten more than a thousand policies and never lost as long as he did not stake more than fl. 150 at one time. "Now," he complained, "I am confronted with a loss of fl. 300 on one ship. I do not want any more of these dealings, because I have no luck. Sometime ago I earned fl. 100 in many small bits, then I lost fl. 200 in one stroke . . . . and for several years I did no more of it [under-

[86] In medieval policies, this clause was called *habeat vel non* and meant that insurers promised to pay in case of accident whether the insured suffered a loss or not. Bensa, *Il Contratto*, p. 66.

[87] In Genoa, wagers were forbidden by statute in 1467, 1475, and 1494.—*Ibid.*, pp. 125–27. The Barcelona statutes, as early as the fifteenth century, forbade insurance on the life of princes or of the pope. In the Low Countries, an ordinance of January 20, 1571, was issued against life insurance. Wagers had already been forbidden in 1544.

[88] Archivio Datini, No. 853, Fondaco di Barcellona, Carteggio da Bruggia. Letter dated March 13, 1400: "Sono bene avisato delle bargie presse e qui anche n'è la novella, e pare abiano portato via la roba da ungni uomo . . . . car se io vivessi mille anni, mai più farò sichurtà a persona." The premium was 12 per cent for the voyage from Bruges to Barcelona.

writing] ; then I started all over again."[89] There is doubtless exaggeration in this statement. It is an outburst of ill humor upon receipt of bad news. Nevertheless, one wonders how well merchants such as Francesco Datini understood that marine insurance was a device for the sharing and the even distribution of sea risks among merchants.

By the fifteenth century marine insurance was established on a secure basis. The wording of the policies had already become stereotyped and changed very little during the next three or four hundred years, as can easily be ascertained by comparing the Florentine policy of 1397 with the forms published by Malynes in his *Lex mercatoria* or by Postlethwayt in his *Universal Dictionary of Commerce*.[90] In the sixteenth century, it was already current practice to use printed forms provided with a few blank spaces for the name of the ship, the name of the master, the amount of the insurance, the premium, and a few other items that were apt to change from one contract to another.[91] But the terms of the instrument varied only in exceptional cases when the parties to the contract decided to introduce modifying clauses or additional provisions.

V

A significant development in the matter of marine insurance was the elaboration through court decisions of a body of law that tended to be the same in all countries. The fact that the Italians dominated international trade was certainly a powerful force in bringing about a considerable degree of uniformity in the legal interpretation of the standard provisions of the insurance contract. Some Bruges court decisions illustrate this process very

---

[89] Livio Piattoli, "Le leggi fiorentine sull'assicurazione nel medioevo," *Archivio storico italiano*, Series 7, Vol. XVIII (1932), p. 207, n. 1: "I' òe fatte bene mille sichurtà; e dove tochai da fior. 150 giungnendo salvo in gharigha ed altri, e ora sulla nave Panzana òe perduti fior. 300 chon Domenicho di Chanbio. Non voglo piue di queste derate, chè non ò ventura. Altra volta ne feci guadagnare fior. 100 in mille volte, poi ne perdei a un trato [fior.] 200 cho Nicholò da Uzano e chon Benichasa Alamanni, e stete parechi anni none feci piue, poi pure me si rimesi."

[90] Malynes, *Lex mercatoria*, Part I, chap. xxv, pp. 150–51; Malachy Postlethwayt, "Assurance," *The Universal Dictionary of Trade and Commerce* (2d ed.; London, 1757), I, 135–36. The text of the Florentine insurance policy will be found in Bensa, *Il Contratto*, pp. 217–20, and in my *Glossary*, pp. 34–35. Cf. note 51. Goldschmidt (*Universalgeschichte*, p. 375, n. 122) gives a long list of published insurance policies. One may also compare the Florentine policy with the Spanish policy published by Goris, *Etude sur les colonies marchandes*, pp. 633–35.

[91] The Antwerp Municipal Archives have a collection of hundreds of printed insurance policies of the sixteenth and seventeenth centuries.—*Catalogue de l'Exposition de l'histoire économique d'Anvers* (Antwerp, 1930), pp. 7 f.

well.[92] Whenever an insurance case came up, the judges asked for the opinion of prominent Italian merchants concerning the prevailing mercantile custom. The judges in their decisions were likely to give much weight to this opinion. Thus the Bruges court accepted the principle that the insurer who had paid became the rightful owner of any salvaged goods;[93] that the insurer was not answerable if a ship sank in port before sailing,[94] or if a ship was already lost at the time of the contract;[95] that, in case of default of tidings, the indemnity was not due as long as the insured did not renounce title to the insured goods in favor of the insurer.[96] The court also decided that the insurer was not liable if there were reasons to believe that the insured had received secret intelligence of the shipwreck before taking out the insurance.[97] In still another case, the court ruled against a plaintiff who had insured goods for more than they were worth.[98]

A similar process of establishing a series of precedents went on in other seaports. In some of them the rules were codified at an early date and incorporated in a statute.[99] One of the most comprehensive codifications was that of the customs of Barcelona in 1484.[100] They were printed together with the *Consolato del Mare* and exerted great influence. The Barcelona Code became a model for similar laws in other countries. In England, marine insurance did not gain a firm foothold until the reign of Elizabeth. Even at the end of the seventeenth century little progress had been made toward the

---

[92] Trennery (*Origin and Early History of Insurance*, pp. 264 ff.), discusses the Bruges court decisions at considerable length but he assumes that Flanders played a greater role in the development of marine insurance than the country really did. He fails to notice that the insurers were Italians in almost every case. There were only one or two exceptions.

[93] L. Gilliodts-van Severen, *Cartulaire de l'Estaple* (Bruges, 1904), II, 181–82, No. 1123, May 19, 1469, Jeronème Vento *vs.* Jean Baptiste de Laignello.

establishment of ascertained rules of English law.[101] It was not until the eighteenth century "that Lord Mansfield evolved from mercantile custom and foreign precedents the principles of our modern law."[102]

The statutory stage in the development of marine insurance is beyond the scope of this study. Marine insurance was a mature institution before its organization and regulation by law. Like double-entry bookkeeping and the bill of exchange, marine insurance was the creation of an age that saw the rise of the sedentary merchant and the decline of the traveling trader. Marine insurance was the outcome of the merchant's quest for security; in a similar way more modern forms of insurance, such as life insurance, fire insurance, accident insurance, and workmen's compensation, were developed in response to the needs of an industrial and individualistic age.

EARLY BRONZE AGE CULTURAL RELATIONSHIPS

IN THE MEDITERRANEAN

WITH SPECIAL CONSIDERATION OF THE CYCLADES

Yon Olaf Hockmann

General Conditions. Conditions in the Ancient Orient

In the 3rd millennium BC, the transition to the practical use of metals, which had previously played only an insignificant role, as raw materials for tools, water, small utensils and art objects took place in large parts of Western Asia and the Mediterranean region. The new material opened up such a wide range of possibilities and gave impetus to such rapid technological development that the impression could be created that the cultural advances taking place at the same time, which culminated in the formation of the advanced civilizations of Mesopotamia, Egypt and the Indus region, were also directly caused by the new technology.

This impression is false. Various peoples of the Levant, Asia Minor and Southeast Europe used native copper from the 4th millennium onwards without becoming highly civilised.
On the other hand, as the foreign word for 'copper' in Sumerian (urudu) confirms, the highly cultured peoples probably learned about the metals from their 'barbarian' neighbors: the fertile alluvial plains of the Nile, Euphrates, Tigris and Indus do not contain any deposits.

Nevertheless, the highly civilized peoples recognized the advantages of metal tools and made extensive use of copper and tin, silver and gold, which they had to obtain through trade, conquest or mining expeditions.

I would like to try to show that such contacts led to the spread of individual elements of advanced civilizations and that the rapid development of Early Bronze Age (in some countries referred to as 'Aeneolithic') cultures in the Mediterranean region can be traced back to direct or indirect contacts with the advanced civilizations of the Ancient Orient, which were initiated by the metal trade. In this indirect sense, metals can also be called a motor of cultural development in the Aegean and western Mediterranean regions.

Let us take a look at the situation in Mesopotamia and Egypt at the beginning of the 3rd century.
Thousands BC Here city or territorial states with differentiated societies emerged.
structure and an efficient administration in the service of human or divine rule, whose boundaries became blurred. The stability of the social structure
tures as a result of regulated ownership structures benefited no less than the sédkulare or

Machine Translated by Google

Priestly administration benefited from a decisive innovation: writing, which gave permanence to thought and word, facilitated the transmission of experiences, regulations and teachings of wisdom and made the emergence of advanced civilizations possible.

1 The abbreviations consisting of the author's name and the year of publication refer to the

thematically structured bibliography p. 109pp. — Edzard 1967, 63.

In the 3rd millennium BC it is first evident that ideas about the nature and extent of the inhabited world arose in Mesopotamia. Sargon I of Akkad (ca. 2350-2295 BC) was able to attempt to conquer this world "to its ends" and reached the "Upper Sea", the Mediterranean, via the "Cedar Mountains" (Amanus or Lebanon)* and the "Silver Mountains" (Taurus)*. Apparently he was not even the first to conceive the ambitious plan of world domination. Moreover, the "Cedar" and "Silver Mountains" had already been visited in mythical times by the hero Gilgames®, and had therefore probably been vaguely known to the Sumerians since time immemorial. Northern Syria and the Lebanon region, although located on the furthest periphery of the Mesopotamian high culture area, may have been under Egyptian rule as early as the end of the 4th millennium BC. BC, contacts were made in another direction, namely with the land on the Nile: The mastabagribers of the pharaohs of the 1st dynasty in Abydos not only show a general similarity with early Sumerian temple complexes, but even correspond in detail with the 'Eye Temple' of the early Sumerian Djemdet Nasr period in Tell Brak in northern Syria. Intensive land-

Connections between Egypt of the 1st Dynasty and North Sinai and South Canaan, which began in the pre-dynastic period, can be proven by means of finds of Egyptian origin in these areas and of Canaanite in Egypt. Long before Sargon, spatial distance was not an insurmountable obstacle, not for contacts by land and certainly not for those by sea (see below p. 57 with note 18). This applies not only to advanced cultures, but also to peripheral cultures without writing: as numerous finds prove, the early Bronze Age city of Arad in the Negev (see map, fig. 8) exploited the copper mines in southern Sinai - probably by means of seasonal worker caravans over 400km of impassable desert paths19.

It is likely that the main motive for long-distance contacts, direct or indirect, was the desire of the highly civilized nations to acquire those goods that their own country did not produce or only produced in insufficient quantities. Even Sargon's campaigns were considered to have been motivated by economic reasons: The (just as unimportant for Egypt)

Machine Translated by Google

The (dispensable) timber from the "Cedar Mountains", building stones and metals were important enough for the raw material-free alluvial land along the Euphrates and Tigris to motivate the conquest of the raw material sources and important transshipment points.

As can be seen in the Sumerian epic of Enmerkar and the Lord of Arattac, a country located in the Iranian mountains,12, these contacts may have involved

The boundaries between voluntary exchange of goods and forced transfer of ownership were fluid: the Sumerian Enmerkar first tries to obtain precious stones and metals from the foreign 'business partner' in exchange for food. When the latter refuses, Enmerkar decides to 'convince' the unwieldy foreigner and takes possession of the desired articles (and the metalworkers of the foreign country at the same time - an important indication of archaeologically intangible 'exports'!) by force of arms. This example shows how diverse forms of contact must be expected for the 3rd millennium BC. In addition to the forms of exchange of goods and robbery attested here, there is a third that is just as important: the establishment of permanent trading posts in foreign countries, a system that is attested by the Assyrian trading posts (karim) in Anatolia *+. In these well-organized settlements, coordinated by the central karim Kani§ (Kiiltepe), Assyrians lived in a kind of symbiosis with the local population, and were thus always informed about the possibilities and potential threats to trade. Although there are still important questions about this exchange of goods, it is clear from the 'business records' in Kani§-Kiiltepe, among others, that metals also played an important, perhaps central, role in these economic connections. Unlike the examples mentioned above, however, here—at least in one documented case 15—

This raw material was not purchased for import to Mesopotamia, but in
significant

Quantities were exported to the foreign country; the sources speak of a caravan with 11 tons of the precious tin, the origin of which is still a mystery. Incidentally, the Assyrian trading posts seem to have had forward 'representatives' in local cities, because the obstruction of Assyrian merchants in the probably south-west Anatolian city of Purugkhanda ¢ was used by Sargon as an excuse for his campaign in the distant north-west.

The examples mentioned should be sufficient to prove our thesis that in the 3rd millennium BC there were extensive and partly well-organized long-distance connections by land that enabled a regulated exchange of goods. It is equally informative to look at the evidence of long-distance connections by sea.

The crossing of long stretches of open sea was possible, as the early Neolithic settlement of Cyprus, Crete or Skyros shows, at the latest in the 6th millennium BC, and the vehicles must already have been sufficient to transport not only settlers and their families but also

Machine Translated by Google

It is therefore not surprising that in the 3rd millennium BC the
Maritime traffic both in the Arabian Gulf — the “Lower Sea” — and on the
Levantine coast was lively enough to be economically important for Sumer and Egypt
have.

13 In this respect, the temporarily disrupted trade in lapis lazuli from Badakhshan (Afghanistan) to Egypt and Mesopotamia is informative (Helck 1971, 25: Import via Sumer to Egypt; Herrmann 1968, esp. 21 f. 29 f. 37, pp. 53f.; Crowfoot Payne 1968, esp. 58; Maxwell-Hyslop 1977, 86). In Egypt, lapis lazuli appears almost only in graves that also contain other foreign goods (Crowfoot Payne 1968, 59):

Port goods are the privilege of the wealthy; cf. J. Crow- foot Payne, Lapis Lazuli in Early Egypt, in: Iraq 30, 1968, 59.

16 Gadd 1971, 426.

A wealth of source material leaves no doubt that Sumer and Akkad maintained a fairly regular maritime trade with the countries of Dilmun (Bahrain - apparently an international transshipment point, a 'port of trade')1?, Magan (Oman on the Arabian Gulf coast) and above all with Meluhha®, which is seen with good reason as the Indus region. Meluhha is described as Sumer's most important trading partner, although it is about 3000 km away from Mesopotamia!®,

and if the attribution of some ancient Mesopotamian place names to the (unknown)
Language of the Meluhha people20, there may even have been Indian trading posts on the Euphrates and Tigris. Imports from the countries on the "Lower Sea" included gold and silver, tin and copper, precious stones, timber and stone, gypsum and bitumen, as well as agricultural products, animals and textiles2* - an astonishing selection that shows the importance of these connections for the Sumerian economy22. This does not mean that metals, timber and textiles were not also imported from the "Upper Land" (Syria) and from Elam. While metals and precious stones never appear in the records of private trading houses and were therefore probably subject to a monopoly of the state or the king??, other luxury items>*, building materials and textiles were probably available to private trading companies.

Machine Translated by Google

During Sargon's time, the Akkadian Empire reached for the first time as far as the "Upper Sea", the Mediterranean, which was at least touched by Sargon himself on his Anatolian campaign. Tradition even reports - albeit in an ambiguous manner - that he crossed the "Upper Sea". Finds of Akkadian seals in Ugarit could be connected with this, unless, as is considered, they are to be interpreted as an indication of the permanent stationing of Akkadian ships in northern Syrian ports. Even more unusual is the statement in a document from a later period, since the Akkadian Empire also included two countries "beyond the Upper Sea": Kaptaru and An(n)aku. The first of the two is clearly identified: Kaptaru is the Caphthor of the Bible, the island of Crete28.

According to Cretan chronology, Sargon's lifetime falls into the FM 1 stage, which, like the contemporaneous stages FK IT and FHII, is characterized by numerous indications (see below p. 65) as a time of international connections within the Greek region.

The country of An(n)aku is mysterious. Its name clearly refers to 'tin' and may perhaps be generally translated as 'tin country'. Previous localization

Attempts to use lead instead of tin range from Spain3® via Laurion (Attica)3! to the southern Anatolian region west of the Gulf of Issus32.

Another possibility seems to me to be possible. If the word An(n)aku does not refer to lead but to tin, the distribution of objects made of tin or tin-bronze, which was much rarer at that time than the copper-arsenic alloy, could perhaps provide clues to the location of a 'tin country'. In that case, the Troad with the offshore northeastern islands would be the most likely location for An(n)akum. E., an area that had objects made of pure tin 33 and tin-bronze long before Sargon L.; in a broader sense, the whole of Agis could be considered (see below p. 691f).

Regardless of the location of the tin country, it is certain that Sargon I was dependent on the cooperation of the coastal cities in what later became Phoenicia, primarily of Byblos (see below), in his seafaring ventures and that for this reason alone his 'rule' over Kaptaru and An(n)aku was hardly more than a more or less extortionate collection of tributes. It was probably a short episode, not too momentous for these countries, much more ephemeral than the Meluhha and Dilmun voyages of the Sumerian captains.

The nautical achievements of Egypt in the Old Kingdom were not inferior to those of the Sumerians. In the 13th year of the reign of Pharaoh Sahure (around 2474 BC) a sea voyage to Punt is mentioned for the first time35, a country that is usually located in what is now Somalia?¢. The sailors of Sahure had to sail the entire length of the Red Sea, which was not without danger for sailing ships. An additional difficulty was that the area surrounding the port of departure, which was assumed to be near Kosseir37, was and is a treeless desert, so that all building materials for the ships had to be brought from the Nile Valley through the Eastern Desert to the Red SeaBe3®. Despite these problems, regular voyages to Punt seem to have taken place in the 6th Dynasty. The Eastern annals are silent on this.

about this almost entirely3%; but the grave inscription of Khnembhotep reports that he was in Punt eleven times*®. The reason for these trips was the wealth of the "land of God" in

48. The barge is 43.40m long and 5.53m wide, solidly built of planks - proof that lengths of 100 cubits (about 50 m) are not unrealistic for ships of the Old Kingdom. Even a slightly later relief depiction from the mortuary temple of Sahure in Abusir#® 148 leaves no doubt that ocean voyages such as the one to Punt were technically possible. An essential prerequisite for this is the equipment with mast and sail. The additional propulsion power provided by the Nile boats through paddles or oars3® is of no great practical importance under ocean conditions.

But the sailing equipment with (foldable) two-legged mast

and square braced square sail was unwieldy enough and only allowed a sailing

astern wind.

These conditions had to

50 Casson 1971, 17£. Taf. 15.

$1 The draft of the Cheops barque is only about 1.30 m (Landstrom 1974, 30f. Fig. 87-89), but

This was a Nile vessel. For seagoing vessels, a much greater draft is to be expected.

2 Schile 1970, Fig. 1 (land view); Markgraf 1961, maps 13. 20 (wind directions and -
strong); Pilot Chart of the North Atlantic Ocean 1974 (currents, wind directions and -
stéirken). According to these maps our Fig. 9a. b.

53 Landstrom 1974, 51, considered sailing close to the wind to be possible as early as the 6th Dynasty, because the mast was now positioned closer to the middle of the ship than before. However, it was not in the middle of the ship until around 1500 BC (Casson 1971, 19).

4 Wenamun was appointed by Ramses XI (20th Dynasty)

sent to Byblos to procure wood for the construction of a god-ship of Amun. His
report is considered a reliable source. Newer translations: Edel —
Borger 1968, 411f.; Goedicke 1975; Lichtheim 1976, 2241f. On Wenamun's journey also Helck 1971, 493; ibid. 1979, 43.

Machine Translated by Google

5 Edel - Borger 1968, 48; Lichtheim 1976, 229; cf. in this regard also H.-G. Buchholz in this publication, below §. 229f. References in the Odyssey also speak for the importance of these sea routes. Odysseus claims to have sailed from Crete to the mouth of the Nile in five days "before a good north wind" (Od. 14, 254 p.): this presupposes - in this direction - the direct route over the high seas. On the way home from Egypt, however, Menelaus touches the Phoenician city of Sidon (Od. 4, 617: 15, 117: these references seem to me to be more important than the statement in Herodotus I 119, quoted by Helck 1979, 40, that Menelaus "first" went to Libya on his departure). Finally, it is even said that the journey from Phoenicia to Libya took place via Crete (Od. 14, 299f.).

There is no information about this; but it is certain that Wenamun could not have returned to the Levant coast; the Palestinian Turks, insulted by him on his way out, would have arrested him immediately, as they even tried to do in the port of Byblos. Wenamun could only have sailed from Cyprus to Egypt over the high seas. I consider it probable that this was a route whose advantages were known to the Egyptian captains long before Wenamun, and which was regularly followed, regardless of the special conditions that applied to this unfortunate traveller.

If we assume that the Byblos sailors really sailed west past Cyprus on their way home, it is quite likely that they were occasionally carried by wind and current to Crete — or even further west. The Egyptian objects found in Crete and even in Kythera (see below p. 137 f.) are thus explained just as easily as the establishment of regular relations between Egypt and Crete, probably as a result of such chance contacts. From the middle of the 3rd millennium BC onwards, in Egypt, in addition to "Byblos ships", "Keftiu (Crete) ships" are also mentioned56. It is also understandable that wood from Asia Minor was also included in the cargo when transporting wood for the Cheops barque®".

The possible objection that such long journeys over the open sea are not feasible without nautical devices for determining position and course can easily be refuted. On the route along the southern coast of Asia Minor to the west, where CW Bleggen had already seen the 'Royal Bridge' from the Levant to the Aegean from general observation58, in clear weather there is a view of land everywhere (Fig. 9a.b)5, and west of Cyprus the ship was picked up by the wind and current without any help from itself and only needed to stay before the wind to be taken back to Egypt. The compass was

Machine Translated by Google

superfluous. In any case, early sailors would have been able to determine directions using the sun and stars.

The nautical possibilities of the Byblians and the other inhabitants of the Levant coast
cannot be measured on the basis of findings. However, I would like to assume that
hold that they were not inferior to those of the Egyptian visitors. Plank-built ships are likely to be in areas
with suitable long timber - such as Lebanon -
rather than in Egypt, which was originally forced by the nature of the local wood to use a peculiar block construction method
not unlike masonry.

56 Smith 1965, 8; Culican 1966, 19. — Ipuwer's complaint during the turmoil at the end of the Old Kingdom, "Nobody
goes to Byblos anymore," and about the lack of oil from Keftiu (Pritchard 1969, 441; cf. also Helck 1971, 27f.; ibid. 1979, 40)
also suggest that there were frequent trips in earlier times.

57 The Mediterranean expedition of Sahure (Smith 1965, 9£.; Mellaart 1966, 69. 152; Drower —
Bottéro 1971, 351; Spanos 1977, 86) could have served the exploration of the Kicin-Asian coasts, because the sea route to
Syria had been known for long enough to no longer require exploration. The gold sheet with a Sahure cartouche
in the north-west Anatolian 'discovery' of Dorak (Mellaart 1959, the cartouche:

754 Fig. 1; ibid. 1966, esp. 151f. 158S. Pl. 17. 18; for the source value of the 'find' see note 81 below) and the golden
cylinder seal of an official of the 5th dynasty, which belongs to another rich find probably from the western Anatolian Pactolus
region (Vermeule - Vermeule 1970, 25 Fig. 9; Young 1972, 11 Fig. 8); however, it is uncertain whether these objects did
not arrive in Anatolia until long after they were made.

See Helck 1971, 36; ibid. 1979, 16.

58 Blegen 1956, 32S.; Kenna 1968.

The Agiis

in the Frithen Bronze Age

In the Aegean Sea, knowledge of metalworking began as early as the late 4th millennium BC, i.e. in the Late Neolithic,6%, but genuine Early Bronze Age cultures - FH, FK, FM; in the Northeastern lead: Troy and Poliochni - can only be spoken of towards the end of the 4th millennium. Their initial stages emerge continuously from the Late Neolithic cultures without any signs of a population change. Only in Crete is immigration from western Anatolia partly assumed for EMI; but even this certainly did not have the character of a new settlement.

Machine Translated by Google

If one takes into account that the late Neolithic cultures of the Agiis already show some similarities, such as the preference for dark-ground, polished ceramics, often with white stripes or patterns, it is not surprising to find general similarities between the Early Bronze Age cultures of the individual regions. They can be explained largely by the similar substrate.

But in addition, already in the Frith Bronze Age, cross-connections can be expected through contacts which linked the Grotta-Pelos culture (FKI)%® of the Cyclades with northwest and western Asia Minor'® and sporadically with Attica'!. As in later times??, the Cycladic culture was the active part here.

This is certainly due to the Cycladic inhabitants' special familiarity with shipping. The Aegean Sea is more conducive to seafaring than any other region in Europe and, with its high, widely visible mainland coasts and islands, which allow long distances to be covered even by rowing ships such as those of the Early Bronze Age - always within sight of land (Fig. 9a.b), offers ideal opportunities for the development of a sea-related way of life. The widespread distribution of obsidian from the island of Melos?, a raw material that was still in great demand in the Bronze Age, as early as the Stone Age?* suggests that the Cycladic inhabitants of the Early Bronze Age had been familiar with the sea and shipping for thousands of years - together with trade and (at least from FK II onwards) piracy. The models (Fig. 10)76 and depictions from the Keros-Syros culture (FK I1)77 attest to a seaworthy vessel propelled by oars or paddles.

a longboat type?8, which undoubtedly enabled long journeys. According to initial information?, an early Bronze Age shipwreck off the island of Dokos (south-east coast of the Pelo-ponnes) appears to represent this Cycladic type. It was carrying a cargo of clay vessels, which were perhaps used to transport trade goods such as olive oil or wine8,0. Whether the coastal countries on the Greek and Asia Minor mainland also had comparable ships has not yet been proven by reliable finds; the ship depictions on a dagger blade from the 'King's Tombs of Dorak' in northern

Western Anatolia! are as controversial in their scientific value as the Sahure

Cartouche from the same 'find' (see note 57). In Crete, however, ships are depicted on various seals as early as the Frithminoan period 82 and the probability speaks in favour of the assumption that the other parts of the Aegean Sea were also associated with seafaring and
were familiar with trade.

The technical prerequisites for contact between the Agiislinders not only among themselves but also with other parts of the Mediterranean region were therefore present in the Early Bronze Age, whereby the light Cycladic rowing ships were far less dependent on currents and wind than the much larger byblos sailors of the Levant. That the latter probably reached the Agiis from time to time has already been stated. It is not

It is impossible for Digidic vessels to extend their journeys to the Levant.
The

Machine Translated by Google

The question is whether such contacts had an impact on the cultural development of the Agiis

and what kind they were.

In principle, a distinction must be made between two forms of possible connections with the East.

These can be described as 'general' or 'specific similarities'. General similarities are evident - if we ignore the functional forms of stone or copper tools and implements, which have no significance in this respect - above all in ceramics. For example, the technique of coating clay pots with a bright red coating and polishing them to a shine, at a certain stage of development at the transition from the Chalcolithic to the Early Bronze Age of

Palestine to the Lipari Islands (see below p. 90). In the Aegean, vessel handles in the shape of a spool of thread or an hourglass ('trumpet handle') belong to the same stage, which may be pierced narrowly - only to accommodate a cord. Red polished pottery, which should not be confused with Neolithic red-coloured types84, is found in the immediate vicinity of the Mediterranean (usually together with dark polished pottery) for the first time in the area of the northern Levant and Syria, where

it belongs to the 4th millennium BC. From there it spread quickly to the south, where it forms a striking group of finds of the 'proto-urban' culture of Palestine®®, and reached Lower Egypt in the course of the trade links already mentioned?. The design remained
in Palestine also popular in the Early Bronze Age.

Machine Translated by Google

In the Turkish region, bright red polished pottery appeared suddenly at the end of the Neolithic period (corresponding to the Chalcolithic period in Anatolia and the Near East) in Chios and Athens. In FB List it is just as common in south-western Anatolia as in north-eastern Turkey, where it is initially described ('Blue Period' of Poliochni) as a variation of dark, polished ware, perhaps due to the type of kiln used. A little later (Poliochni 'Green' and 'Red', Troy I)2, however, the red colour is undoubtedly used intentionally.

At the same time as Poliochni 'blue', red, polished pottery began to appear on the Greek mainland®? and in Crete®*, and it seems that only the Cyclades in FK1 did not know of such pottery®. Here it is only found in FKIT.

The short time interval between the appearance of the shiny red pottery in the Levant and in the Agiis suggests that there are connections. I consider this assumption to be more likely than the possibility of an auto-

chthonous origin in the Aegean. However, the vessel shapes in the individual areas are too different to suggest that the new pottery technique was spread by wandering potters® or even by migrations of larger groups of people - S. Weinberg explained the emergence of the FM I culture of Crete®" by such a phenomenon. The rapid expansion must have other reasons. I think it is not unlikely that the aim in the east and west was to imitate red-gleaming vessels made of gold or copper®8. In line with this assumption, it would seem that in some places the shapes of the clay vessels (sharp-edged or broadly grooved profiles, strap handles and even rivets) are toreutic.

Metal Objects and Metallurgy

At the beginning, it was possible to outline the central importance of the metal trade on land and at sea for the countries of the Near East. The same is certainly true for the Aegean region %6. Although copper mining has been proven in isolated cases during the Early Bronze Age197, local copper can only be assumed for the Cyclades and Crete. The Greek mainland98 and western Asia Minor were probably largely dependent on imported copper. JD Muhly even reckoned that there was a metal trade between the Aegean and the eastern Mediterranean region as early as the 4th millennium BC1%®. In the Saxon Early Bronze Age, copper was often alloyed with arsenic, either naturally or intentionally. 1 Intentional alloying is a difficult process that has also been demonstrated in the East (for example in objects from the 'proto-urban' find at Nahal MiSmar in Israel). In particular, the danger of serious damage to health when handling arsenic, which could only be avoided by complicated smelting processes, makes it unlikely that the systematic manufacture of arsenic alloys was invented in more than one place. The chronological priority of the Near East supports the assumption that this is the centre from which the difficult smelting techniques, which required a great deal of experience, were passed on to other areas such as the Aegean. 3

As an alloy material for copper, which is difficult to cast and forge in its pure form, tin is superior to arsenic in every respect. Its most important disadvantage is the rarity of deposits4. It has been shown (see above p. 54) that in the Middle East in the 3rd millennium BC, it was precisely the need to supply foreign countries with this metal that stimulated the development of long-distance trade systems and motivated military action.

has. The possibility has already been mentioned above that Sargon's tin country An(n)aku "beyond the Upper Sea" could be located in the area around the northeastern Greeks, where objects made of tin bronze from the early Bronze Age have been found; they have been interpreted by archaeologists as evidence of completely exploited tin placers in the area around the Troad!15. In view of the similarities between the northeastern and northwestern Anatolian cultures (Poliochni-'Blaw', Kum Tepe Ib, but also Trojal and Yortan) on the one hand and the Grotta-Pelos culture of the Cyclades (FKI) on the other, K. Branigan's suggestion that tin exports were the source of the wealth of early Troy makes sense16; for tin bronze (in some cases, as in the Troad, with an unnecessarily high tin content) is also known from the Cyclades17.

These explanations are contradicted by the argument of Muhly and Maddin (see note 15), since according to the written evidence from the Assyrian trading posts in Eastern Anatolia in the later

Machine Translated by Google

3rd millennium BC, large quantities of tin were traded overland to Anatolia, which indeed seems to speak against the autarky of Asia Minor. However, the problem may be of a chronological nature.

The Trojan culture reached its peak in Troy IT. Its most important evidences belong to the final phase of this golden age and were partly buried as 'treasure finds' in connection with the catastrophic destruction of the city, partly covered by falling debris. In the following period, despite some signs of continuity in the development of undemanding material goods, there can no longer be any talk of unusual wealth in Troy.

If we assume that Troy's prosperity before the catastrophe was linked to tin exports, the subsequent decline could reflect the drying up of the sources of this wealth. The general decline in the percentage of tin in bronzes of the early 2nd century.
Jts. is an outstanding fact (analysis tables in: H.-G. Buchholz, Berliner Jb fir Vor-und Frithgeschichte 7, 1967, 189f. and in: U. Esin, Kuantitatif Spektral Analiz . . ., Istanbul, 1969). The robbery of the metal workers of Aratta by Enmerkar (see above p. 541f.) could also provide an explanatory model for this8. The fact that tin bronze was still available for domestic use in the following period11? is no proof of the continuation of exports on an early scale '2°.
The orientation of the Akkadian metal trade in eastern Anatolia does not need to represent an argument against tin exports from Troy in the earlier Frith Bronze Age: the central question concerns the time of the end of Troy11 g.

C. Renfrew2! dated the catastrophe to around 2400—2300 BC based on radiocarbon dates from other sites, and similar estimates have been made based on ar-

115 On tin in northwestern Anatolia: Renfrew 1967, 13; tion. Anders Ross Holloway 1981, 52. 105: he saw in the same 193713;2Bra,nigan1974,64.ThattherehasbeennoearlyTroynotacitybutasanctuary;the

Tin was detected (Muhly 1976, 99), could possibly be explained by the complete exploitation of the deposits in ancient times (Renfrew 1967, 13). In addition, evidence from Sitagroi V (Renfrew 1972, 313) suggests deposits in the vicinity of the Pangaion Mountains.

116 Branigan 1974, 64.

chdological methods suggested by others'?2. J. Mellaart2? and Renfrew124 equated Troy IT with the FB II period in the Cilician city of Tarsus, which is dated to the time of the 4th dynasty of Egypt by imported pieces25. This gives the above-mentioned end date for Troy ITg126.

In contrast, M. Mellink and others127 equate TroyIT with the FB ITI of Tarsus. This gives end dates for Troy II at the earliest in the Akkadian period or (P.
Calmeyer)!28 even later. Let us see connections between the catastrophe in Troy and similarly radical destructions on the Greek mainland1d29 and in Crete'3% and let us consider a radiocarbon date for TroyTV (T-168: 2058 +110 BC)!3" which was confirmed by the discovery of a vessel of the TroyV type in Tell Ta%yinat in the

If the connection with the Amuq J phase is confirmed archaeologically 132, the date of the end of Troy IIg around 2400-2300 BC, i.e. shortly before the Akkad period or in its older part, becomes more likely. The orientation of the East Anatolian tin trade towards Assyria during the entire Akkad period is then no argument against an important position of Troy in the tin trade of the earlier Early Bronze Age. Sargon I's interest in the tin country (An[n]aku "beyond the Upper Sea") may have referred to Troy (or Agiis in general).

Other metals may also have been exported. Copper was present 133, but in quantities that do not compare with those in Cyprus3¢. Western Anatolia supplied gold to Sumer?35; silver from Laurion in Attica and lead from Siphnos have been identified in finds from the Cycladic FBII!®®.

Machine Translated by Google

The deposits were not sufficiently productive. The only important trade seems to have been in Anatolian gold (see below).

luxury goods

The tin trade could explain the appearance of Near Eastern types of daggers37, metal vessels and jewellery in the Agiis; a golden dagger from a princely grave in Montenegro138 is also close to Syrian forms. Although the Agiis had its own types of dagger,' Eastern influences continued until the final phase of the Early Bronze Age and increased in intensity in the following period4. It is conceivable that daggers served as diplomatic gifts to Dagdian princes, like artfully crafted swords41 in Homeric times.

Something similar can be assumed for metal vessels, which were particularly widespread in Anatolia and here (more rarely also in the Cyclades and the mainland) influenced the shapes of clay and marble vessels 142. Close relationships existed especially between the Troad in the Troy phase ITg and the royal tombs of Alaca Hiiyiik '#3; individual vessels from both sites are attributed to the same workshop44. Other metal vessel forms from the Troad can be traced back to Assyria4s, although the chronological situation is unclear146. There are also striking similarities

between jewellery from treasure or grave finds in Anatolia and those in the Royal tombs of Ur!47. WJ Young (see note 135) gave one reason for this:

137 Branigan 1966a; ibid. 1967, esp. 119pp.; ibid. 1968a, 13. 15. 17. 60. On Anatolian forms in the Cyclades also: Renfrew 1967, 10pp.

are also evident in the 'Cycladic pans' and their counterparts in Alaca Hiiyiik, cf. Mellink 1956, 52 pp. pl. 3,3-6.10 (interpretation as a mirror); Renfrew

1972, 336f.; Hockmann 1976b, 162.

143 This is documented by the Knicktillen jugs mentioned in the previous note.

144 Bittel 1959, 31.

135 In graves in Assur and Sippar from the time of the 3rd Dynasty of Ur, three crucibles with rotelle grit of a type common in the Troad were found, cf. Maxwell-Hyslop 1970; Calmeyer 1977, 87. 9093 Pl. 2a—c (for dating, p. 881£.); Spanos 197—7. For vessels from the Troad, cf. Bittel 1959, 1f. Nos. 1-5; 13—22 pass-im, 31. 34. Fig. 1-6. 26. 32; Mellaart 1966, 160 Fig. 50,1. 2; Calmeyer 1977, 90S. Pl. 2d; Spanos

1977, 99. The different chronological approach of the layers in Troy leads to differing chronological conclusions for the crucibles and the knick-knack jugs, cf. Bittel 1959, esp. 15-22; Calmeyer 1977, 95 pp.; Spanos 1977.

146 Spanos denied the connection without giving any reasons. The publication history of the finds may give rise to doubts about their connection.

147 Schmidt 1902, 225S. (Troja); Prausnitz 1955, 27 (Schmuck Troja); Bernabd-Brea 1957b; ders. 1976,

According to his information, the gold in the royal tombs of Ur comes from the Pactolus region around Sardis. According to this, southern Mesopotamia must have known about a metal-rich land in the far northwest long before the Akkad period and had secured the favor of its princes by
rich gifts. Against this background, Sargon I's interest in the "land of tin beyond the sea", which may well be identical with the gold land of the kings of Ur, is hardly surprising.

G. Sakellarakes found similar ivory jewellery in Frithmino graves in Ar-

chanes (Crete)'48. It seems that (for reasons not yet clear) Cretan princes also

Machine Translated by Google

participated in these international relations at courtly level. In the same context, a broken ceremonial axe from the Troy treasure is also of interest, which was probably made of lapis lazuli.14 This assumption has recently been called into question,159 but the description of the material's origins suggests lapis lazuli.2 It is more likely that it was obtained via Mesopotamia than via Egypt (cf. note 13).

Such treasures have so far been lacking in the Cyclades. Here, Eastern influences are primarily evident in stone vessels. Perhaps links to the Levant go back to the Late Neolithic: two pointed cups made of white marble from Kephala!53 are formally largely identical to the clay 'cornets' of the Chalcolithic Ghassul culture of Palestine154. The similarity between Cycladic colour rubbing plates and Egyptian ones is also striking. The evidence of 'Egyptian blaw', a synthetic colour probably of exclusively Egyptian origin, in the Cyclades and in Crete155 proves the export of Egyptian cosmetics for the period of the 4th Dynastic and 148t connections also seem possible in earlier times. Perhaps decorated bone shells'S6 - containers for cosmetics? from Early Bronze Age sites in the Levant, the Cyclades and the Troad

-,

present, should be seen in the same context.

284f. pl. 240p. (Poliochni jewelry); Bittel 1959, 1f. (Troas); Bass 1965, 261f.; ibid. 1970 (Troas); Vermeule — Vermeule 1970; Young 1972, 5p. (Pactolus area); Rudolph 1979, 12p. 19 (Trabzon). A silver skyphos from another find in the Troad deserves special attention (Muscarella 1974, nos. 1-4), which combines a Trojan hollow handle with a Sumerian sphere body and foot (cf. Woolley 1929, 33f. pl. 8 below). A gold chalice from Dorak is similarly heterogeneous (Mellaart 1959, 756 fig. 14; ibid. 1966, 165 fig. 51,10; for the 'find' see note 81 above). While the finds from the Troad, Poliochni and the Pactolus region show common forms, the find from Trabzon stands out from this group.

and Ar-

chanes (see note 148). They allow K. Branigan's opinion

seem a little exaggerated

that these objects are only 'souvenirs' that came to the Agiis in the course of trade with other goods (grain, dates, and possibly gold).

would be 165.It remains uncertain whether the Aegyptiaca came directly from Egypt to the Agiis

or through the mediation of Byblos16¢6,

Siegel

The majority of Egyptian sickles from the Frith Bronze Age belong to the type of stamp seal that was already known in the Neolithic period and was also prevalent in Egypt and Syria. While the cross patterns with spandrel filling by angled lines67 (which were particularly popular in Anatolia in the 3rd century BC) are too widely scattered in space and time to allow a more precise determination of origin, some seals or impressions with more distinctive patterns on clay vessels from northeastern Egyptian18 and Cycladic6® finds of the FB I can be linked to Egypt or Syria. Cretan seals in animal form imitate Syrian models7, the same can be assumed for stamps made of metal1" or ivory72.

Cylinder seals, which (originating in Mesopotamia) were also popular in northern Syria, are known from finds in the FB I1 in Troy'73, Mochlos, Amorgos and Corinth7#. Renfrew's reference to cylinder seals as early as the Macedonian Neolithic75 does not speak against the derivation of the pieces mentioned from Syria, since both their shape (with a small hemingway) and - in the case of the Amorgos seal - the patterns are attested to in northern Syrian imitations of Mesopotamian cylinder seals from the Djemdet Nasr period176. As roll-offs with local patterns show'7?, the type was further developed independently in the Agiis. A special position is given to the golden cylinder seal of an Egyptian official of the 4th Dynasty178, which is considered to be part of the grave find made of Pactolus gold mentioned in note 147. Young assumed that it had been brought to the foreign country by an Egyptian courier. If the seal belongs to the find, it proves direct contacts between the Nile region and Asia Minor around 2500 BC. This would correspond to middle Troy, and there are also some connections between the jewelry from the Pactolus find and that from Troy.

In particular, the more than 100 seal impressions from Lerna, which were used to mark and protect wooden boxes or vessels, indicate the connection between seals and more developed forms of trade. In this respect, the Aegean was obviously not significantly behind the Levant in the FB IT. It is worth noting that a group of stamp seals from Byblos, which belong to the later Frith Bronze Age, can be traced back to Danish models(!) on the basis of their circular patterns*8°.

Machine Translated by Google

elements from the religious sphere

Since the Early Bronze Age cultures of the Agiis had no written language and no elements could be isolated in later Greek religion that could be traced back conclusively to the Early Bronze Age 81, our only sources are finds. All hypotheses regarding the religious ideas of that era are based, apart from pure conjecture, solely on the nature and location of human and (rarely) animal figures, drawings and some special types of buildings, objects and vessels. The uncertainty of attempts at interpretation is shown by the fact that no evidence is available for the most important source type - marble figures from graves.

173 Troy: Schliemann 1881, 463 No. 500.501; 464 No. 502.503 (both from the 'Burnt City', ie Troy I1g; without Osc); 463 No. 499 (clay, with Ose). — Poliochni: Bernabo-Brea 1957a, 208 Fig. 25; Renfrew 1972, 445 Pl. 23,3; Pini 1982, 602 with note 12.

There is a consensus as to whether they can be recognized as religious evidence at all 182. However, it cannot be reliably determined if changes occur in the form of the (probably or presumably) religiously related objects that do not result logically from local development. Only such changes can be investigated here, with Cycladic finds being the focus of the study 183.

The most important one occurred in the later part of FB 1, when the small, abstract, amulet-like "violin figures" were joined for the first time84 by larger, round, sculpted, standing figures of the so-called Plastiras type (Fig. 11¢)!85. A derivation from the violin figures is not possible from a formological point of view. Thematically, it is new that some Plastiras figures depict men. On the other hand, in terms of style, size and motifs, there are such close similarities with copper and bronze statuettes of naked figures from Syria (Fig. 11a.b)% that connections can be assumed.

182 Overview: Hockmann 1976a, 43f. The interpretation of the grave goods as personal possessions of the living person, who had to follow him into the grave, is not least contradicted by the rarity of tools in the graves (Branigan

1969, 7with note 34).

183 See Héckmann 19764, 42. 45; ibid. 1976b, 160pp. 18+ Thimme 1976, 417, also considered Neolithic traditions for standing figures. However, the similarities are minimal, especially since the head and body

The visual appearance of the Plastiras figures differs fundamentally from the molds
Neolithic sculpture.

185 Renfrew 1969a, 6pp.; Thimme 1976, 437 no. 67 cat.-fig. 67 (our fig. 11¢ as a redrawing after a museum photo from East Berlin, Pergamon Museum).

186 Originally (Héckmann 1976b, 160) I had found in metal statuettes from Tell Judeideh (Braidwood 1960, 300 pp. fig. 240245 pl. 56—64) that Braidwood

The drilled eyes of the Plastiras figures, which were probably once mostly inlaid with a different coloured material (Fig. 11d), also point to the Levant and can be traced back to the Chalcolithic Beersheba culture.

Machine Translated by Google

The Plastiras figures, in contrast,

set to the violin figures individually and

personally. I would assume that she

are not only new as a type of image, but

also changed ideas about deities

reflect: Gods' personalities8n8,

as they are characterized by attributes (WaSen) in Tell Judeideh. Such a profound change in the religious world of ideas, as I believe is evident from the Plastiras figures, presupposes a deep familiarity with the Syrian religion, which could not be gained through only sporadic and superficial contacts.

Near Eastern elements are also evident in the so-called canonical '8 marble figures of the FKIT stage. The facial representation on earlier canonical sculpture corresponds to mask-like alabaster heads from the Djemdet Nasr period from Tell Brak (Fig. 12)190. Life-size figures from Amorgos belong to the same period, which are difficult to imagine without the model of Near Eastern or Egyptian large-scale sculpture 9. The motif finds counterparts in seated harp-player figures from the Cyclades (Fig. 13)192.

were dated to the early 3rd millennium BC, were seen as possible models for the Cycladic marble figures. The finds from Tell Judeideh are now re-dated to the early 2nd millennium BC by Negbi 1976, 15. 67. 120, and by Spycket 1981, 80f. 283 pp., in order to be able to compare them with the Syrian statuettes of the Middle Bronze Age. It is assumed that Braidwood did not notice that the statuettes were not deposited together with layer G, but were lying in a pit that was probably only dug into layer G during the time of Judeideh I. If this re-dating is justified, the statuettes from Tell Judeideh would have been created too late to be considered models for the Plastiras type of Cycladic sculpture.

Regardless of how justified the doubts about Braidwood's observations are and how close the statuettes in question are to those of the 2nd millennium (that they differ formally from the majority of them is also acknowledged by Negbi and Spycket), the statuette in the 'Trésor d'Ur' from the pre-Sargon palace of Mari (Parrot 1968, 15 pages with fig. 7.8.12.13.15Tbaf. A. B 1.2 Color plates 4—8; Spycket 1981, plate 52.83; Land of Baal, exhibition catalogue Berlin 1982, 68 No. 57 with color plates, then our Fig. 11a.b), that slim, unclothed, standing metal figures in Syria already before 2300

Machine Translated by Google

BC. The find from Mari is so detailed and vividly modelled that a longer preceding development can be assumed. I consider it quite possible that its beginnings go back to the early 3rd millennium BC and that the models for the Cycladic Plastiras figures are to be sought in this area rather than in a local tradition based on the Neolithic standing Cycladic figures (see note 184), which - not attested by any reliable finds - must have taken place alongside the fundamentally different development of violin figures of the FK I.

Grave Forms and Burial Customs

The predominant grave types of the Early Bronze Age in the Cyclades, as well as partly on the mainland and in Crete, stone boxes or domed graves made of small stones, often with a non-functional false door, are indigenous and can be traced back to the Neolithic period2°6. It is all the more striking that in isolated cases - beginning with a late Neolithic example from Athens2°? - graves have also been attested which are carved into the rock in the form of a vertical shaft with a chamber at the side2°%. In one case, in a grave from the earlier Early Bronze Age from Corinth299, two chambers lie opposite each other. This rock chamber grave only becomes more common in the later Early Bronze Age2'°.

Rock-cut chamber tombs are the predominant burial form in 'proto-urban' Palédstina?‼.

In view of the similarity of Cycladic-Late Neolithic marble pointed beakers with 'proto-urban' Ténernen 'cornets' (see above p. 73 with note 153.154) and other similarities

Palestinian rock chamber tombs cannot be ruled out.

In early Minoan Crete, the—without any recognizable native precursors in FM1

They are therefore traced back to foreign models: round sanctuaries of the (much older) Halaf culture of Mesopotamia, North African round wall graves or even the small dome graves of the Cyclades? 12. None of these comparisons is satisfactory. In contrast, the newly discovered round mortuary houses of Bab ed-Dra in Jordan?'3 represent good parallels.

Round (and square) above-ground or slightly sunken buildings for numerous burial

Machine Translated by Google

The settlements here began at the beginning of the 'urban' phase (around 3000 BC). The similarity in the form of the houses, their use as graves and even the custom of multiple burials in both areas is clear enough to identify the models of the Cretan
Tholoi in the vicinity of Palestine. The custom of multiple burials in Crete had already been linked to Palestine by Branigan214, where it is documented in the 'proto-urban' rock chamber graves, such as were common in Bab ed-Dra both before and after the mortuary. In the Aegean, this custom is first encountered in the Cycladic-Late Neolithic stone cist graves of Kephala2!s.

A unique finding is the 'burial mound of Amphion and Zetos' in Boeotian Thebes, which Th. G. Spyropoulos traces back to the model of Egyptian pyramids.

was?216 The excavator saw in this a sign of the Egyptian colonization of Boeotia, which, according to the finds of shards in the mound, falls into the FH II. Three gold pendants217 in the (looted) burial chamber have, to my knowledge, no parallels in the Agiis. They appear to represent papyrus flowers>1® and perhaps support the connection of the monumental

Machine Translated by Google

Grave complex with the Nile region. However, to prove Egyptian colonization, much more import objects (or, at least, clear influences in the Early Helladic finds) would be required.

Urbanization and Architecture

Similar to Palestine2!® and Syria220, in the Agiis during the Frith Bronze Age - here in Stage II - there was a transition to a way of life that can be described as urban.21 The settlements became larger. At least in some places, social differentiation became apparent, which presumably corresponded to industrial specialization. The resulting concentration of desirable goods in these cities made protection by elaborate fortifications necessary. The labor required for this could only be provided, voluntarily or by force, by the community of all inhabitants. These characteristics allow the fortified settlements of the FBII to be described as cities, although important prerequisites for an efficient administration (especially writing) were still lacking.

Defensive walls (as in the Ostiigiis) are already known from the FB I, but only became more numerous and more elaborate in stage IT222. They reveal four concepts: 1. In Aske-tario (also in Marathon-Plasi and in Aigina?) the curtain wall does not appear through

216 Spyropoulos 1972; ibid. 1981, 102 f. 117{f. — cf. also a copper scimitar of Egyptian type from Eutresis (Goldman 1931,218Fig.286,7). Similar pieces were also found in Spain (Savory 1968, 164

tacts between the Iberian region and the Aegean Sea (see the last section in this text).

217 Spyropoulos 1972, 20 Fig. 4.

218 Whether the papyrus motif can be considered as evidence of links with Egypt is not certain, however; Warren 1976, 89 pp. (in the same sense: Betts 1978, 61 pp.) concluded from the frequency and type of depictions from the Middle and Late Minoan period that the plant also grew on Crete. Evidence from the Frith Bronze Age was not mentioned.

Temple Palace

The wall of Kastri (Fig. 14a)228 is so similar to that of the FB II phase of Arad in Stidpaléstina (Fig. 15)229 in every respect that connections can be assumed230. The wall of the 'Acropolis' of Panormos on Naxos (Fig. 14b)231 shows a related concept; here the curtain walls merge with the bastions to form a curved facade that projects forward and backwards.

Even gate systems with a narrow, long corridor as in Troy or with a bent gate corridor as in Aegina appear to be simpler versions of a type that was highly developed in Palidstina232.

227 References: Demetrias, Kastri, possibly Panormos; see Hockmann 1975, 276f.

232 In R&$ ha-Nigra and Dothan (Helms 1976, 3 Fig. 2; 6 Fig. 3) the task of making the narrow gateway as long as possible in a small area is better solved than in Aigina (see above note 222) or Troy Id-IIb (see ibid. and Dorpfeld 1902, 16. 53f. 5659 Fig. 10.
12 Appendix 3: Goals Fl and FN), but the fortification principle is identical: the attacker is given the opportunity to develop his full attacking power in the goal area for as long as possible.

K

And

"in,

Oh or

The apsidal houses in the Agiis are also likely to have originated from there233. Here the type reaches back to FB I; the oldest building in Troy Ia also belongs to it234. In contrast, in Palestine and Syria it has a tradition that begins long before the Early Bronze Age233,

Similar conditions prevail in the case of round and oval buildings, which in the Levant and Cyprus can be traced back to the Frith Neolithic23¢. In the Aegean they are known both as original buildings2e37 and as models (slate pyxides)?238 mainly from the Frith Bronze Age23°. A round building in Tiryns reaches monumental dimensions, in which the wide stone plinth common in Mesopotamia and Anatolia is evident, as is the use of fired bricks?4°, which also recurs in the megaron-like large 'House of Tiles' in Lerna?#! and the similar 'White House' in Aegina?¢?. A model, a slate pyxis from Melos (Fig. 16a.b)243, attests to the arrangement of several round buildings around a common courtyard enclosed by a facade wall. It is based on a building from the Early Bronze Age in Beth Yerach (formerly Chirbet Kerak) in Galilda (Fig. 17)244

Machine Translated by Google

convincingly similar, which can probably be interpreted as a sanctuary. The model also seems to represent such a sanctuary; the horn sign above the gate corresponds to Anatolian horn altars in a sanctuary in Beycesultan (Fig. 18)245. Here two cellac are arranged in pairs, as is known several times from Palestine246. Perhaps a

House in the centre of Kastri, whose main room is divided into two cellae by a partition wall, can also be interpreted as a sanctuary for a pair of gods247. This assumption finds a certain support in the (admittedly older) Plastiras figures (see above p. 76f.), which depict men as well as women. Similar to the forms and motifs of the Marble sculpture would then also show particularly close similarities between the Cyclades and the Levant in buildings that presumably served the cult.

Fig. 16a and b. Early Cycladic pyxis in the form of a building from Melos, Aegean: oblique view (a), detail of the entrance (b); slate, H 9.5 cm. Munich, State-

historical antiquities collections

Summary

From the end of the Neolithic onwards, elements of the end-Chalcolithic and 'proto-urban' cultures of Palestine and Syria can be recognised in material goods, burial forms and customs, particularly in the Cyclades. In Crete, genuine imports from the Frith Dynastic Egypt began. The nature and motives of possible connections cannot yet be defined.

In FBII, the agreements increased both qualitatively and quantitatively. In

Machine Translated by Google

In the vicinity of Troy they are evident in the form of precious 'courtly' equipment and jewellery, which suggest that the Anatolian princes had been in contact with Middle Eastern rulers long before Sargon. If the Egyptian cylinder seal really belongs to the Pactolus gold find and the gold sheets with the Sahure cartouche were really found in Dorak (see notes 57 and 81), Egypt must also have sent embassies and gifts to Asia Minor in the 4th and 5th dynasties. The less valuable Egyptian imports in Crete and Kythera point in a similar direction. However, these could also have been mediated through Byblos, which was closely linked to Egypt in cultural and commercial terms. The relatively clear relations with Byblos during FM II also provide the only indirect evidence for the correctness of Sargon's claim to have incorporated Kaptaru-Crete into his empire; for without the cooperation of the Byblosian fleet, an attack on the distant island would have been impossible for the land ruler Sargon.

gon would have been impossible. In any case, Crete's dependence on the Akkadian Empire could not have been very close.

The transition to 'proto-urban' forms of life in the Cyclades followed extremely closely the models from the Palestinian-Syrian region. This is particularly surprising in religious matters. Perhaps it helps to understand that both Egyptian and Sumerian deities (such as Inanna/Ishtar and Du-muzi/ Tammuz) were already known in Byblos at this time248. This meant that the local deities, who were probably only vaguely defined, took on the personal characteristics of the foreign gods and became identifiable with them. It seems that the impulses of the new religious ideas were strong enough to be passed on to the Cycladic culture - certainly as a result of frequent contacts. Such contacts, which perhaps went back to the Late Neolithic, may also have influenced the areas of architecture and burial.

directed Jewish development in paths that led to a rapprochement with Palestinian and Syrian forms.

Machine Translated by Google

As the seals, props of the owner and the trader, indicate, the forms of commodity exchange in the Early Bronze Age Agiis seem to have reached a similar level as in the contemporary, also still unwritten city states of the Levant. The eastern Anatolian native princes, who

were the trading partners of the Akkadian karum merchants. Here the intensity of the contacts can only be deduced from the Akkadian written sources, while imported finds are not significantly more frequent than in parts of the Agiis. This example shows that the presence of eastern traders does not need to be ruled out here either.

The central importance of the metal trade, which is evident from the Mesopotamian documents 248 Contenau 1926, esp. 120 pp.

Fig. 18. Reconstruction of an Early Bronze Age cult room from Beycesultan, Turkey

as is evident from the extensive mining operations of the Palestinian

ten.

The Agiis and the Western Mediterranean

In the 3rd millennium BC, the use of metals began in the western Mediterranean region, and in connection with this, other cultural elements appear that were already encountered in the Early Bronze Age of the Agiis. Whether there are any connections has been assessed differently. C.
Renfrew et al. denied this: Radiocarbon dates (see above p. 40) assigned a higher age to the western Mediterranean finds than to the Dicean 'models'. However, in my opinion the time differences are too small for such a conclusion; the range of the dates in the west and east overlap. In addition, the fact that, especially on the Iberian
Peninsula, whole complexes of eastern cultural elements appear, which in the native Development has no precursors, seems to me more for the correctness of the older

Machine Translated by Google

249 Renfrew 1967, 17; ders. 1970, 292f.; ders. 1972, 444f.; ders. 1976, 27; Fleming 1972, 305; Riemann 1974, 425S.; Muhly 1976, 111.

The idea?5° that the transition to the Metal Age culture in the west is connected with influences from the Aegean (and possibly other parts of the Eastern Mediterranean). The fact that in the 3rd millennium cross-connections over long distances become apparent among the local cultures?3? also suggests the conclusion that there were new, efficient forms of maritime transport, for which a connection with Aegean nautical science would at least be a plausible explanation.

In the following, elements with parallels in the Aegean Frith Bronze Age in six parts of the western Mediterranean will be addressed: Malta; Sicily and Aeolian Islands (Lipari); Italian mainland; Sardinia and Corsica; Southern France; Iberian Peninsula.

Malta

The island group is predestined by its location as a stopover on journeys from the eastern to the western Mediterranean and as a port of refuge for eastern Mediterranean sailors who are inevitably driven towards Malta by wind and current. Perhaps, as a Maltese stone figure of the Digean-Neolithic type25? suggests, sporadic contacts began as early as 4000 BC. The fact that around 3200 BC in the Red Skorba phase vessels of local form had a red polished surface and “trumpet-shaped”

handles” can be compared with eastern Mediterranean phenomena (see above p. 68), as can the custom of collective burial in rock chamber grids2s3, which began a little later in the Zebbug phase and which can also be related to an end-Neolithic finding in Athens254. The early date of these phenomena corresponds less to Aegean conditions than particularly to those in “proto-urban” Palestine2%s. In contrast, a clay head with a triangular face from the Red Skorba phase is quite close to Cycladic-late Neolithic finds from Kephala2s®. Collective burial is also known in Kephala.

Much later, in the Chalcolithic Ggantija phase, we first encounter shards from the vicinity of Troy I-Thermi257, huts in the East Mediterranean style of construction made of clay bricks on stone bases?%® and sanctuaries made of apsidal buildings around a courtyard2%°.

be.

Essential elements of the Maltese 'temple culture' (megalithic construction, large stone sculptures) cannot be derived from foreign models265. The astonishing and inexplicable level of culture in Malta during the Chalcolithic period may be the reason why, despite visits by Cycladic and north-west Anatolian ships, Aegean influences were only hesitantly adopted. Perhaps the most important contribution of the Aegean visitors to Maltese cultural development was the progress in shipbuilding and nautical science, as can be deduced from western Mediterranean foreign finds in Malta (see

note 251).

260 See especially the bone humpback from Tarxien (Evans 1971, 223), which is connected with Aegean finds (e.g. Lerna: Caskey 1954, 22; Renfrew — Whitehouse 1974, esp. 360; summarized Ross Holloway 1981, 16 pages). For the distribution of such objects, see also the map in the article by H.-G. Buchholz and P. Wagner, below Fig. 25. Evans 1971, 219, also considered Cycladic influence (FK II) on the

(For this and the following, see the literature on page 116£.)

At about the same time as the Red Skorba phase in Malta, the shiny red monochrome pottery of the Diana culture replaced the Middle Neolithic painted ware on Lipari, in Sicily and southern Italy. The forms of the Diana pottery are in the local tradition, but the design - which is perhaps intended to imitate metal vessels>6¢ - and the "trumpet handles" are new in Italy; they repeat eastern Mediterranean phenomena at the turn of the Frith Bronze Age (see above p. 67). Finds of copper slag on Lipari2¢?, which has no copper ore, indicate the presence of foreign metallurgists. The fact that Egyptian influences can be seen at this time on stone vessels?®® and arrowheads with a retracted base? ®? probably belong in the same context.

B. Blance pointed out the similarity of the Diana ware with the pottery of the oldest colony

Mesas de Asta in Spain (see below p. 98) and highlighted similarities with East Aegean pottery (Samos)27°. Stone cist graves were traced back by L. Bernabo Brea to Cycladic models of the Frith Bronze Age?7!; however, the type is now also attested for the Late Neolithic (Kephala, see above p. 80 with note 206).

In the Aeneolithic, rock chamber graves with collective burials began to appear, which had predecessors in the eastern Mediterranean region, but also in late Neolithic Athens (see above p. 80 with notes 207-211). Shapes and (especially polishing) patterns of ceramics273, stone club heads and small finds7 show similarities from the middle Aeneolithic with phenomena of the earliest Frith Bronze Age in western Asia Minor and the

Machine Translated by Google

Ostigiis. In the Late Neolithic groups of Piano Quartara (Lipari) and Malpasso (Sicily), which now also processed metal themselves, these similarities are quite clear.76 and vessel forms from San Ippolito are close to those of the Frith Bronze Age of Cyprus.77 The spectrum of 'guest-like' phenomena remains narrower than in
it

266 Bernabo-Brea 1957, 51, interpreted the monochrome of the ceramics as a ‘reaction’ to the rich painting in the previous period. The similarity with foreign red ware at the turn of the FB speaks against the explanation as a local phenomenon. On the influence of metal vessels on the forms of Diana ceramics: Ross Holloway 1981, 23.

267 Bernabd-Brea — Cavalier 1956, 31. 35; dies. 1960, XXIV. — Renfrew — Whitehouse 1974, 376, identified further copper objects in the Italic Neolithic, but all of the finds are located far to the north, beyond the Po. See, however, Ross Holloway 1981, 34.

The location of Sicily and the Aeolian Islands suggests that they were used as stopovers on a route that led further into the western Mediterranean, as was the case in the 2nd millennium BC.

Italian mainland

R. Whitehouse used isolated rock chamber graves in a Neolithic context as a reason to assume that this type of grave originated in Italy independently of the Early Bronze Age in the Aegean28°. However, Ross Holloway251 had already pointed out that the rock chamber graves of Palestine and Egypt (Negade II) date back to an earlier period than the Italian (and Maltese) finds. Earlier connections with the Levant were also considered by other sources?®,

Rock chamber graves became the dominant form of burial only in the Aeneolithic, and then only in southern and central Italy?283; they are found in all three regional groups (Laterza, Gaudo and Rinaldone). Metalworking began everywhere at the same time. Daggers partly resemble those from the Greeks and Syrians; they apparently reached Crete in isolated cases?84. In addition to copper28s, silver and antimony28¢ were occasionally processed.

is not certain (Selimkhanov 1975, 50; also

Dayton 1978, 115, did not mention Italy among

the countries with antimony deposits).

The pottery of the Aeneolithic differs so clearly from that of the Neolithic that it has been attributed to immigrants from the Aegean287. Larger immigration is unlikely?#8; however, there is an unmistakable similarity to Aegean pottery of the Frith Bronze Age, not only in the way the pottery is made, but also in the shapes and decorative patterns, which in some cases clearly imitate metal vessels28. Models are known particularly from north-west Anatolia (Troy, Yortan)290, and to a lesser extent from the Cyclades; two conical-neck vessels from Pitigliano2°! are remarkably similar in form and decoration to Cycladic vessels from the Grotta-Pelos or the Kampos group (FK I). Decorative forms also link the region with the East?°2. The simultaneous appearance of these innovations (also with the Aeneolithic of Sicily, Lipari and Malta) 2-3 can be explained by early Bronze Age contacts with the Aegean and Cyprus294. The copper deposits of Tuscany were certainly an attractive target for foreign metallurgists. The presence of foreign teachers would make the rapid blossoming of metallurgy in the Aeneolithic of Italy understandable295. If the daggers found in Crete (see note 284) really come from Italy, they represent valuable evidence of the Aegean's interest in Italian metals.

Sardinia and Corsica

The prehistory of Sardinia in the 3rd millennium BC is still only partially known. Stone cist graves with stone wreaths in Li Muri (Arzachena) have been dated to this period29s, which are not dissimilar to grave forms in Greece, but also in Palestine??7. Among the finds, a steatite bowl29e8, stone beads?®® and club heads made of steatite300 appear to be 'eastern'; however, these indications of foreign influences do not yet provide a clear picture. The Ozieri (San Michele) group is more widespread, which includes red polished earthenware with 'trumpet handles' similar to the Diana pottery (or only that of the Tarxien phase of Malta?)391. It has mostly been dated to the 2nd millennium BC392; however, C!* dates suggest that

for a considerably earlier beginning393, perhaps even before that of the Arzachena group?°%. Still unpublished finds (see note 303) show that the Ozieri group as a whole is indigenous; however, its appearance is influenced by the Aegean
Frith Bronze Age was strongly influenced.

Rock-cut chamber graves with collective burials are more likely to be associated with the Late Neolithic evidence from Athens (see above p. 80 with note 207) than with the Cycladic graves of the later Frith Bronze Age3°5. However, stylized bull horns on a painted false door in the rock-cut chamber grave of Mandra Antine3¢ are strikingly reminiscent of the horn attachment on the gate of the building model from Melos, which can probably be dated to FK I (Fig. 16a.b). Conical horns point to the Greek Late Neolithic or the Grotta Pelos Group (FKT).

neck vessels3e07, while pyxides (Fig. 21 b)*°8 or a stone bowl with spiral reliefs from Orgosolo3% are close to the FKI stage. The Greek models are particularly clearly reflected in Sardinian stone sculpture. Obese statuettes with bulbous head decoration31° are close to a Neolithic type from Greece312. Much more common are figures that are simplified imitations of Cycladic idols from FKII-III stages312. They were also made in the 2nd millennium313, but began earlier. The figure from Senorbi (Fig. 21 c¢)314 stood in a stone bed like non-figurative steles in Li Muri.

In Sardinia, Cycladic influences are more evident than those of north-western Anatolia, which have predominated up to now. However, the latter are not lacking3?5; in particular, a pendant with an 'owl face' (Fig. 21a) is so similar to Trojan idols!¢ that it may be an Anatolian import. Finally, the earth 'pyramid' Monte d'Accoddi?!7 should be mentioned, which was usually associated with Mesopotamian ziggurat temples3!®. The 'burial mound of Amphion and Zetos' now offers itself as an obvious parallel (see above p. 80f.).

These links with the Agiis are contrasted by others that connect Sardinia with the Fontbouisse group of southern France, the Iberian Peninsula and Malta. Some of the rare

drawn325. Otherwise, some types of decorative beads - especially wing beads and three faience beads - can possibly be traced back to the eastern Mediterranean region??º. The relatively active copper processing in the Fontbouisse group can hardly be traced back to direct contact with foreign sailors, since it began earlier inland than on the coast327. Other 'foreign' phenomena include stone wreath graves similar to those of Li Muri (see above p. 93 with note 296) and some tholos graves*?®, oval and round huts in the suddenly emerging stone construction style?2° and the 'fortress' of Lébous (Fig. 22b)33°, whose architecture is reminiscent of eastern Mediterranean

Elements: The round building B 4 of Lébous about 148t belongs to the early Helladic period as well as the of Tiryns (see above p. 84 with note 240). Lébous was previously associated with the colonies on the Iberian Peninsula (for these see below p. 98). However, X. Gutherz33! now questioned both the fortress character of the complex and its Chalcolithic date.

Machine Translated by Google

A special problem applies to the particularly numerous figural steles ('statues-menhirs')332 in southern France, on which figures that can be identified as male with a triangular dagger or axe or other figures that are certainly female with multiple necklaces are depicted. They are also attested in Corsica and Sardinia, Italy33® and large parts of Western Europe and Switzerland, but are less common there with a similar shape and theme. T-shaped stylized faces only make a loose connection to the stele from Troy I (see note 257), and the dagger shape is quite unobtrusive for a derivation from the Dacian Frith Bronze Age334. A similarity of the

'Women-

Stele' of the West with an isolated figural stele from Souphli in Thessaly33%. This is, however, dated Neolithic; possible connections in the West must also be evident in Neolithic contexts. Loose connections in this direction do not seem to be completely excluded336.

325 Renfrew 1972, 444, thought that these pieces had only come there recently.

Since the other foreign elements may have reached southern France from the Iberian Peninsula337 or from Sardinia, with which already in the Neolithic

Although connections existed in 338, the Cycladic jugs from Marseille and, uncertainly enough, the faience beads remain the most important evidence of connections to the eastern Mediterranean region. They are hardly sufficient to prove close connections with the Early Bronze Age of the Agiis33?

Iberian Peninsula

In the parts of the western Mediterranean region that have been discussed so far, individual elements could be identified that appeared in the 3rd millennium BC without any indigenous precursors and that show more or less close parallels in the eastern Mediterranean region; however, their selection was almost always so inconsistent that it was difficult to draw conclusions about the nature of the connections.

The Iberian Peninsula offers a different picture.

Finds indicate connections not only with the Neolithic cultures of Italy34° and the Balkan Peninsula3#!, but also with the Neo- and Aeneolithic of the Levant and Egypt?%. Particularly striking are schematic stone figures of the type El Garcel#3, which

"Violin idols" of the Levant 344 and the Agiis 34; less clearly, relationships with the East are also evident in other types of idols346.

Copper slag from El Garcel also dates from around 3000 BC. 347 This gives a similarly early start to metalworking as in Lipari (see above p. 901); it is hardly a coincidence that the 'late Neolithic' - rather Aeneolithic -

Almerfa culture concentrated on areas with copper ore deposits348. It deserves attention,

that this culture includes, among other things, red polished earthenware®*? and (rarely) red-painted pottery*°° with simple geometric patterns, for which connections to the Aeneolithic of Sicily have been assumed351.

At about the same time, in the first half of the 3rd millennium BC352, simple round graves (tholoi) with collective burials began to be used in south-eastern Spain, the area of the Almeria culture. These continued to exist alongside the local megalithic graves (see below), which also featured collective burials, and developed further, with occasional influences in both directions. The fact that the flat idols (as well as stalked arrowheads; see
Note 342) only occur in the round graves?334, can be understood as an indication that the tholos grave also belongs to a 'foreign' component in the Almeria culture355, parallels can be found in the Early Bronze Age of the Aegean as well as before

the Levant (see above p. 80)356. In addition, the early Almerfa culture—as well as its contemporaneous neighbouring groups, particularly in southwest Portugal®>7 and Murcia?8—knew the type of rock chamber grave with a round chamber and vertical shaft

Machine Translated by Google

or horizontal passage (dromos)3°, which could also be traced back via Malta and Italy to the Agiis and ultimately to the Levant.

It therefore seems that the early Almerfa culture was influenced by the Eastern Mediterranean which could be explained by the signs of copper processing. These influences are clear, but were not strong enough to characterize this culture (as well as the neighboring ones)3°? in its entirety as 'Eastern Mediterranean', but rather stand out from a native component. The megalithic graves belong to the present, whose derivation from the Early Bronze Age of the Aegean is based on chronological and

other reasons can no longer be maintained361. Of course, it seems to me Is it not justified to conclude that all East Mediterranean influences were based only on coincidences?®? After all, even the original origin of megalithic tomb architecture in the Levant remains a matter of debate.

Around the middle of the millennium (or frither), a new development emerged in southeastern Spain, at the mouth of the Guadalquivir and in southern and central Portugal near the coast. Pottery and small finds show forms that did not result from the previous development, and fortified settlements emerged shortly afterwards, which

in their architecture and in the finds so clearly from the neighboring native cultures that they are interpreted and described — as I think rightly363 — as foreign colonies364,

The location of these colonies on the coast or on rivers that were once navigable shows that their founders were seafarers for whom shipping was the most important means of transport.5 The motive for these colonies is equally clear: they are all conveniently located near important copper deposits, and the comparatively abundant finds of copper slag and casting molds36 - in the colony, which is unusually deep inland

Cerro de la Virgen near Orce even found ore samples?7 - together with the clear increase in the number of finds of metal objects and equipment 368 leave no doubt that the colonists came to the country because of the deposits of copper and probably also silver?°?. They not only exploited the naturally arsenic-containing, perhaps partly additionally arsenic-containing

Machine Translated by Google

They not only used the alloyed ?7° copper of the Iberian Peninsula to a far greater extent than can be proven for the previous period?'!, but also introduced advanced processing techniques. The difficulties and dangers of the 'hot' processing of arsenic copper have already been mentioned (see note 112). Just as remarkable as the mastery of this technology is the fact that the colonists were the first to produce larger objects using the casting process372. The sheer extent of these technical innovations alone suggests that processes developed elsewhere were transferred to the Iberian Peninsula.

were transmitted.

All the new features of the colonies have analogues in the Early Bronze Age of the Aegean or other countries in the eastern Mediterranean. This is particularly evident in the form of settlement in the colonies. The round huts, for which at least some domes can be assumed, have their best parallels in Orchomenos (Boeotia)37¢. The construction in mud bricks?75 on a stone base corresponds to the eastern Mediterranean construction, as does the whitewashing of the interior walls37¢, which is about

at the 'White House' in Aegina (see note 242). The same direction is indicated by the design and construction of the fortification walls, which is now uniformly known from a number of colonies377. In the normal case - the best example is Los Millares at

Almeria (Fig. 23)378 — a compact wall made of unworked stones, following the contours of the terrain, surrounds the settlement area; straight walls are rare?79, This curtain wall is flanked by semicircular bastions at moderate, rarely at greater distances38° (Fig. 22a)381, as is known from Lerna, Kastri (Fig. 14a) or Arad in Palestine (Fig. 15; see above p. 83). Massive, later hollow round towers can be considered a variant of this type3%3. In Vila Nova de Säo Pedro in central Portugal, the bastions merge with the curtain wall to form a curved, projecting and receding facade (Fig. 22¢)384, as was found in Panormos (Fig. 14b). Small round 'castles' without bastions, such as the 'forts' in Los Millares, are unusual; they correspond to the early Helladic round building in Tiryns (note 240). The gates are narrow passages38, as in Kastri or Arad; a long gateway38¢ corresponds in concept to the gate systems in Troy 1d-1Ib (see note 232). It is particularly noteworthy that the so-called herringbone masonry made of alternating slanted layers of stones has been demonstrated several times3%7.

Machine Translated by Google

This type of construction is widespread in the Aegean as well as in the Levant (see note 240). An open water pipe at the Cerro de la Virgen3#8, however, can only be compared with the waterworks of the Old

Orient or Egypt.

The colonists did not introduce any new types of graves, but used rock chamber and round graves, which were merely refined architecturally3%°. However, a number of individual forms and special burial forms, such as the construction of stone circles around the grave or the deposit of grave goods outside the grave, show parallels in the Early Bronze Age Agdis area3?1. It is worth noting that the tholoi of Pai Mogo and Praia das Magas in Portugal do not seem to have been originally built as graves, but as sanctuaries392. They would be found in the round buildings of Beth Yerach/Chirbet Kerak in Palestine (Fig. 17) and the building model of Melos

(Fig. 16a) correspond to this (see above p. 85). In the same context it may be that occasionally round rock chamber graves are arranged in symmetrical groups3?3 like the above-ground round structures of the two eastern Mediterranean examples.

These relationships to the eastern Mediterranean region are also clearly evident in the pottery of the colonies. The grey or red pottery decorated with polished patterns of the early — probably still unfortified — colony of Mesas de Asta?°* tends towards the Late Chalcolithic of the Eastern Aegean, and the relationships of the so-called symbol pottery of southeast Spain point in a similar direction — to the area around Troy1 —, whose eye patterns find their best equivalents in the FB I of the northeast Aegean395. Stone vessels can also perhaps be linked to those of the Cyclades and Crete, despite some differences39¢.

Particularly striking are the relationships to the FB I pottery of the Cyclades, which are evident in the zigzag-decorated pyxides from central Portugal, the so-called 'Copas' (Fig. 24b)397.

Machine Translated by Google

They were clearly made in Portugal itself, but in such a close resemblance to the cylinder pyxides of the Grotta Pelos group (FK 1) that it is difficult to understand that they were made by chance. For the rare painted vessels of the colonies, connections with the Aegean are less clear, but suggestions can be made.
from the area of the Anatolian or Cretan FBT or III3%°.

(proof of local production); Savory 1968, 1324f.; Spindler 1969, 78f. (both against import; the pottery of the colonies only imitated foreign models); Blance 1971, 92f.; Savory 1972, 33 f. — See also the conical neck vessels (such as FK I) in Leisner's 'Level 7' in south-eastern Spain (Leisner 1943, pl. 161, B 7,3; C7,6; E 7,9;

K 7,21). — Metal vessels are not yet known from the colonies, but may have been present.

This is supported by the similarity of a silver cup from St. Adrien (Briard 1978, 13 pages, fig. 2,1-3; similar gold cup from Brittany, lost: fig. 2,4) with a silver cup from the Troad (Muscarella 1974, no. 4): the form can only have been brought to Western Europe via the colonies. The cup from St. Adrien was originally considered to be neolithic (according to information when it was delivered to the restoration workshop of the RGZM Mainz); it is now dated to around 1700 BC (Briard 1978, 19).

398 Blance 1959, 460pp. In this respect, the excessively large pottery kiln at Vila Nova de São Pedro deserves attention (Savory 1968, 159 Fig. 52,1.2).

Machine Translated by Google

It should be mentioned that similar ceramics to those of the colonies have also been found in Morocco was 400,

The stone and bone sculpture of the colonies is almost always stylized to the point of non-figurativeness and, unlike the flat 'plaquettes' of the previous period (see notes 342 and 346), is round-sculpted***. Particularly characteristic are baityloi and cylindrical idols, which only partially, like the 'symbol pottery', have large eye patterns°2. Some of the types have parallels in the Levant and Agiis43, while others are indigenous4.
Very rarely do we come across figures that are more close to nature. Of these, an ivory statuette from Almizaraque with an incised pubic triangle filled with dots *5 is more closely associated with Cretan imitations of Cycladic sculpture *°° due to both the material and the way the triangle is reproduced*'".
On the whole, however, the sculpture of the colonies is closer to Anatolian than to Cycladic or Cretan4%8.
In addition, a component with parallels in predynastic Egypt can be seen; cylinder idols with the head laid back, ‘sandals’ made of stone or ivory and ‘crosiers’ made of stone4%? belong to this group.

An Egyptian component is also evident among the other small finds. Sharpened and finely retouched flint daggers have parallels in predynastic Egypt, as do arrowheads with a concave base, the dominant type of the colonies.19 The latter, however, do not necessarily have to be traced back directly to Egyptian models, as they are also widespread in the Aegean and on Lipari.11 Ivory combs, boxes and beads2, the material of which probably comes from North Africa, point in the same direction.12 Given the distance not only in space but also in time between the colonies and prehistoric Egypt and the almost complete lack of connecting finds, it is difficult to reconstruct the type of transmission.

(Fig.242)422 from the megalithic tomb Monte do Cabego, which is similar to a Frithhelladic steatite seal from Eutresis auSallend 423,

Regardless of the fact that the Portuguese seal is probably made of Iberian copper*24, it indicates forms of trade as evidenced by seals and impressions for the Early Bronze Age of the Aegean, and makes direct connections seem possible. The most important, although perhaps not the only, reason for the presence of Aegean colonists and traders in the far west was certainly the unusually rich deposits of copper on the Iberian Peninsula, which is characterized by a high natural content of arsenic*?5. This makes it easier to cast than pure copper and may have been particularly sought after.

E. Sangmeister has assumed (see previous note) that the Agiis initially only obtained arsenical copper from the west. Even if this were true, Aegean metallurgists soon processed arsenical-copper alloys that differ from Iberian material by containing traces of other metals. In this respect, some objects made of 'Dgdian' arsenical copper are gaining importance on the Iberian Peninsula, particularly Sangmeister's material group C 6426; they underline the probability that Aegean metallurgists worked in Spain and Portugal or that Aegean metal objects occasionally reached the colonies. These are not the only clues: some curved knives (see note 368) - an east Mediterranean type anyway, whose colonial date is confirmed by a stratified find in Zambujal*? 7 - are made of tin bronze. Since this material can be regarded as typical for the Early Bronze Age of northwestern Anatolia and the Aegean (see above p. 691f.), the eastern origin not only of the type but also of the objects themselves can be considered. These knives can perhaps claim to be recognized as genuine Aegean imports alongside the Cycladic jugs from Menorca and Marseille (see above p. 95), and they surpass those of scientific interest.

414 Blance, on the one hand, assumed (1971, 100) direct connections along the North African coast, but on the other hand only considered indirect connections (ibid. 49).

scientific importance, since their archaeological context is clearly established.

In this respect, the finds of 'Aegean' arsenic copper and 'Aegean' tin bronze represent a final link in our argument that the numerous eastern elements in the colonies cannot be dismissed as convergence phenomena, but are linked to close and probably direct contacts between the Iberian Peninsula
and the Eastern Mediterranean.

It is difficult to say exactly how these contacts took place. There are no Aegean written sources from this period, and the Oriental and Egyptian ones are silent - as was to be expected. The mixture of cultural elements from different parts of the eastern Mediterranean region that characterizes the colonies42 speaks more for 'joint ventures' of small groups of people brought together by common interests and the same courage than for organized enterprises at state level in defined spheres of interest. This is even more likely for the period before the founding of the colonies, which may have been necessary for economic reasons. Unlike on the Sinai Peninsula and perhaps even in Punt, the indigenous population of the Iberian Peninsula was probably not able to mine and extract copper on their own, at least initially, so that eastern Mediterranean specialists had to be brought in for this purpose. For the early period (El

Machine Translated by Google

However, temporary visits by foreign prospectors, such as those who left their mark on Lipari, can be expected. Perhaps these first expeditions can be imagined as being similar to those of the “Venediger”, who from the late Middle Ages onwards roamed Europe in search of the minerals and earths that the workshops of Murano needed to colour glass*?? The first metal prospectors in Spain and Portugal seem to have come mainly from Palestine and Egypt. It seems that the Aegean only began to take part in ventures in the far west somewhat later, but before the establishment of fortified colonies *3°. As the East Aegean-looking finds on the Guadalquivir and the 'Cycladic' copas in Portugal show, the Strait of Gibraltar did not represent an obstacle. It remains to be seen whether this expansion to the Atlantic coast was solely due to the greater daring of the Egyptian sailors or the better suitability of their ships for the nautical conditions in the Atlantic, or was caused by the greater pressure of the Syrian or Egyptian 'competition' in the more easily accessible southeastern Spain.

The development of Vila Nova de Säo Pedro (see previous note) and other settlements into heavily fortified city-like colonies represents the next phase and the high point of the relations between the Iberian Peninsula and the Eastern Mediterranean. HN Savory's interpretation of the fortifications as the seats of a newly established foreign ruling class, which may have already found Eastern Mediterranean settler groups, does not seem impossible; but it remains to be seen whether a Syrian-Levantine sphere of interest in Almeria can really be separated from a Cycladic one in Portugal, or whether, as B. Blance believed (see note 428), at this time on the Iberian Peninsula in all

'Colonial zones' Aegean influences (Trojan-Anatolian alongside Cycladic) and those from Syria and Egypt penetrated each other in a way that was almost inseparable*32, without there being any ethnic-sociological differentiation.

Machine Translated by Google

The complexity of the situation is shown by the Serraferlicchio elements in Spain and Portugal, which are believed to have reached the West in the wake of foreign sailors.

In any case, it must be assumed that not only experienced builders were needed to build the fortifications, but also a large number of workers; small foreign ship crews were hardly sufficient for this. It is more likely that local workers (voluntarily or involuntarily) helped to build the colonies' defensive, residential and water structures under the guidance of foreign builders and using East Mediterranean techniques (herringbone masonry, mud brick and dome construction). Similar conditions can be assumed for ore extraction in the mining areas, while the smelting and processing of copper was apparently carried out in the colonies themselves by foreign specialists. This model of an economic (and probably also ethnic) symbiosis between the local and foreign population explains the cultural influence of the colonies better than the assumption that the two groups lived strictly separate from one another. It could also explain why the finds from the colonies differ from those of the 'mother-land' in that they are less artistically made and have different details. These differences are less pronounced in the case of tools, water and equipment that sailors had to take with them, and which are most likely to be genuine imports from the East, than in the case of luxury items and jewelry, which were probably made entirely in the colonies themselves. A special case is the production of 'Copas' and other ceramics in Portugal, which surpassed their Danish counterparts in terms of craftsmanship. As the unusual size of the pottery kiln in Vila Nova de Säo Pedro shows, pottery was probably made commercially here. Such products may have been intended in part for the local population, whose labor and supplies such as food and firewood the colonists probably had to rely on on a permanent basis.

These contacts seem to have led to tensions: the colonies were destroyed in the late 3rd millennium BC. In the following strata, finds of the Bell Beaker culture appear for the first time, and the conquerors can be seen as the bearers of this culture433.

The origin and spread of this culture cannot be discussed here; it must suffice to indicate that its bearers belonged to the indigenous population of the Iberian Peninsula, but were evidently culturally influenced by the colonists 434. A certain knowledge of the way of life in the colonies is also indicated by the fact that at least some of them were still inhabited by the conquerors. They also strengthened the fortifications, but in a primitive way and by abandoning the bastions 435. A lack of familiarity with the technical achievements of the colonists is also shown by the following:

Machine Translated by Google

the deterioration of the aquiduct in Cerro de la Virgen43¢ and the mostly backward methods of copper processing (see note 372). Nevertheless, the bell

Beaker culture provided important impetus for the spread of metallurgy in many parts of Europe. It also seems significant that its bearers - probably also based on the experiences of the colonists - worked as seafarers in the western Mediterranean and reached Sicily in an eastward expansion.

To sum up: The similarities between the Iberian Peninsula and the Eastern Mediterranean

The findings in the Mediterranean region appear too numerous and too clear to be convincing as convergent phenomena. They suggest connections between the two areas; and this also explains the less clear eastern Mediterranean phenomena, particularly in Italy: in the case of contacts, as suggested by the graves of Cycladic and perhaps Egyptian ships in Malta, the coasts and islands of the Tyrrhenian Sea and probably also the African coast must have been touched by eastern Mediterranean sailors. That the ships of the Levant and the Aegean were able to reach the western Mediterranean is not only evident from the depictions in Malta, but also from the frequent voyages of Egyptian ships to Punt, as attested by the grave inscription of Khnemhotep.

It is worth noting that these great nautical exploits were not mentioned in the Eastern sources of the time. The lack of literary references to long-distance voyages in the Mediterranean is therefore no proof that such voyages did not take place. The voyages to Punt also show that there must have been voyages of discovery during the Old Kingdom. It does not take much imagination to imagine that the reports of the course of drifting Byblos sailors across distant countries and islands in the "Great Green", the Mediterranean, triggered planned voyages of exploration that may have led to the rich copper country in the far west. The Egyptian predynastic

Machine Translated by Google

Elements already present in the Almeria culture make it probable that the first explorers were Egyptians and (probably as their partners) residents of the Levant coast, whose influences can also be felt early on in the Aegean. Western Anatolia and the Aegean

seem to have taken part in such ventures only later; but their influences (and those of the Levant) are more evident in Italy and Malta than Egyptian ones, which probably made their way more along the North African coast.

The motive for such long-distance journeys is derived from the literary evidence of the great importance of the metal trade, which also played a role for punt sailors, as well as from the archaeological evidence of copper smelting in El Gärcel and Lipari, to name only the earliest. Presumably the copper cargoes brought home from the far west in the 3rd millennium BC represented no less wealth in their time than the fabulous profits of Kolaios from his chance journey to Tartessos much later. I would like to assume that the lure of Iberian copper was strong enough to trigger the contacts between East and West which culminated in the establishment of colonies, the archaeologically tangible effects of which could be summarized here.

CHAPTER XLVI

JEW TRADERS IN BORDEAUX.

Slave trade by Jews in Aquitaine. — Accusation brought against the Jews of Bordeaux of having delivered this city to the Normans. — Legislative provisions concerning Jews of Poitou and Gascony in the 11th century. — Mentions of those of Bordeaux in the Gascon roles, the acts of Rymer and elsewhere; pepper tax imposed on the Jews of Bordeaux as on those of Aix en Provence. — Spanish and Portuguese Jews established early in our city. — Portuguese merchant who died at the Chapeau-Rouge home, in 1546. — Emigration of Jews from Spain and Portugal driven out by the Inquisition; they take refuge in Bordeaux and Gascony. — Activity imparted to Bordeaux commerce by these foreigners; jealousy they inspire. — Retirement of some of them; edicts issued in favor of tres by Henri II and Henri III, in 1550 and 1574. — Persistence of the envy which the Jews p tugais are the object; order from Marshal d'Ornano intended to protect them. — Crowd Spanish Jews in Bordeaux, especially at the time of the fairs; postmaster's affair Ponteil. — Denunciation brought against all Portuguese Offices; it has no consequences. — Rigorous measures taken in 1625 against the Portuguese of Guienne; intervene tions of the jurates in their favor. — Rigorous prosecution of the tax authorities against them. — Notable Jewish merchants of Bordeaux at the beginning of the 16th century; factories founded by some of them. — Denunciation of the Jews of Bordeaux by the Sieur de Pressigny. — Request from the Jews of Bordeaux to extend their trade. — Opposition of the merchants of Dijon — Lawsuits brought against the Medina family — Arrival of the Avignon Jews. Germans in Guienne; judgment of the Council pronouncing the expulsion of the newcomers; sixteen families are forced to leave Bordeaux. — Place of two Jews from Avignon to be restored to their trade; opposition of the House. — Complaints against Jews and fairground inarchands; the Chamber persists in its ideas, and only responds to observations Mr. de Tourny. — Return of a certain number of Jews from Avignon; they turn their industry towards banking and armaments. — Their petition to be relieved of the judgment of 1734 is a crown of success. — New petitions from Avignon Jews; those are rejected by the jurats and the Commerce Council; trading permissions granted to these Jews were patents obtained in 1759 by six families of theirs. — Arrival of new Jews in Bordeaux; they are still expelled. — Limitation of antagonism between Portuguese and Avignon Jews. — Travel of three Jews from Bordeaux to Paris to trade there.

The Jews show up early in Bordeaux; we see them there, as in ancient Rome, trading in slaves. This industry, all the more productive as the cruel wars of which Aquitaine was then the scene must constantly fuel it, was exercised by the Jews of our southern provinces in

Machine Translated by Google

virtue of an imperial privilege which allowed them to buy captives from conquered countries, take them to Spain and sell them to the Muslims. The clergy finally spoke out against this infamous traffic; He spoke, through the mouth of Agobard, to Louis the Débonnaire!, and had the rescript which authorized this trade revoked, in a council held in Toulouse in the year 829. Adalelme, metropolitan bishop of Bordeaux, attended the synodal assembly to represent Vasconia, whose interests were at stake, because of the neighborhood of this province with the Peninsula?.

We do not know if the Jews of Bordeaux continued the slave trade; but we can believe it if we add credence to the accusation brought against these Jews of having, in 848, delivered the city to the Normans. They already inhabited this Mont-Judaïqüe which the Bordeaux Chronicle speaks of in the year 1273, and which is mentioned in the act of

1, "We commanded the Christians not to sell Christian slaves to them (the Jews), so that they would not allow the Jews themselves to sell the Christians to Spain," etc. (Saint Agobard, archbishop of Luydun, Opera, ed. AND NAVIGATION IN BORDEAUX. has

Machine Translated by Google

donation and foundation of the priory of Saint-Martin by Geoffrey, Duke of Guienne, under the date of 10771.

From this time on, there is no longer any question of the Jews of Bordeaux before the 11th century; yet contemporary documents are not always explicit on their account.

In 1182, Philippe-Auguste had issued an order by which his subjects were relieved of the sums they might owe to the Jews: this order must have affected those of Guienne, although subject to English domination, by reason that having debtors everywhere, they could not escape the effects of such a law. The ecclesiastical authority indicated the means for the future. In 1214, Cardinal Robert of Cork, legate of the Samnt-See, wrote to John Sans-Terre to inform him that he had convened a council in Bordeaux.

In this assembly, it was ordered that the lords would repress the usury of the Jews, under penalty, for the latter, of seeing all commerce move away from them, and, for the merchants as for the barons, of being struck with 'excommunication?., In 1219, following a general measure, which extended to the Jews of Poitou and Gascogne, those of Bordeaux were forbidden to buy or sell any kind of objects, except the provisions of the Day, otherwise than in the sight of Christian prudential men.

1 Discourse on the antiquilez found near the Saint-Martin lès Bour-deaux priory in July 1594, following the Chronique bordeloise, edict. by m.ncoui., folio 45 reclo. Cf. Darnal, Suppl. chronicles, etc., p. 11; and Detcheverry, History of the Israelites of Bordeaux, p. 16, 17. |

They were also forbidden to receive wet or bloodstained linen as pledge, or anything that belonged to Holy Church and could give rise to the slightest suspicion.
“Thus,” adds the king in his letter to G. de Neville, his seneschal, “that this took place in the time of King Hénry, our ancestor, and in the time of King Richard, our uncle. »
It is to be regretted that the sentence presents too much obscurity for it to be possible to decide whether the king means to speak of legislation in use in England, or only

in Poitou and Gascony.

On June 3, 1265, Edward, eldest son of the King of England, gave Bernard Macoynis, citizen of Bordeaux, his Jew from Lesparre, Bernard Bénédict, to own it during his life, as well as all the income he could earn from it. . It seems that this Jew from Lesparre was very well known; because Bréquigny has preserved for us a donation, dated October 21, 1283, in which another Jew is designated by the quality of brother of this Bénédict *.

On May 23, 1275, Edward E wrote to the Constable of Bordeaux that he had learned that the community of Jews, already prey to the scarcity which was being felt this year, was still burdened with taxes. He therefore forbids this officer from oppressing the Jews or imposing them without his order. In a second letter, this time addressed to the seneschal of Gascony at the same time as the constable of Bordeaux, Edward announced to them that he was in-

formed that the community of Jews of Gascony, at the instigation of certain of their competitors, finds itself overburdened with enormous taxes levied under the most futile pretexts, and that we crack down with the greatest rigor against those who cannot pay them; that he does not intend for the Jews to be persecuted in this way, and that, when justice has to deal with them, they will be judged by prudent and loyal Christians.

The community of Jews of Gascony having remonstrated with the king that most of them were emigrating to escape the intolerable restrictions with which they were burdened, this prince returned to the charge to order them to be reduced. On the other hand, in 1291, Philip the Fair issued an order to enjoin all Jews coming from Guienne and England to leave the kingdom before mid-Lent.

Machine Translated by Google

In the Gason roles, there is still frequent mention of the Jews of Bordeaux, namely Aaron of London #, and of Elie, son of Bénédict, of the same city#, who, undoubtedly, had left England for get closer to Spain, with a view to seeking asylum there, in case they are disturbed in the English possessions. A disastrous fate was reserved for them in this new homeland. Towards the end of the 13th century, they were expelled from Guienne, and again in 1318-1956. At this

At the time, they fell under the attacks of the peasants, King Edward II took account of their property, and ordered an investigation into the murders committed against them. Other documents published by Rymer shed light on the condition of the Jews of Bordeaux and Gascony under the Plantagenets. Under the terms of a burrow of the archbishopric. from the year 1356, the Jews of Bordeaux were required to pay an annual royalty of eight pounds of pepper to the archbishop, payable at Christmas #. When we see, in 1143, an archbishop of Aix giving to the Jews of this city permission to have a synagogue and a cemetery, on condition that they would pay him and his successors, in perpetuity, two pounds of the best pepper, and in 1383, another archbishop granted the same award a similar privilege to all the Jews of his diocese*, we are led to think, with Father Bougerelf, that in Bordeaux as in Aix, the majority

were grocers, perhaps even in commercial relations with the Levant and Spain, since pepper constituted the tribute that was most usually imposed on them.

It is certain that, very anciently, there were Spanish and Portuguese Jews in Bor-deaux only designated as coming from one or the other kingdom of the Peninsula. Speaking only of the Portuguese, they exported from their country, into the British possessions, oil, wine, osey!, wax, cochineal, figs, grapes, honey, cordovan, that is to say morocco, dates, salt, skins and other commodities; but it is doubtful that all those which have just been listed, for example wine, wax and honey, came from Portugal to compete, on our market, with the productions of Guienne.

In 1546, we find a mention of a Portuguese merchant in Bordeaux: it was a certain Lope Diaz, whose name is still carried with honor in this city by an Israelite family; but we cannot say that this Lope Diaz was established there. The inventory after death, at the Chapeau-Rouge home, of his papers and effects Ÿ, seems to indicate that this foreigner did not have his residence in Bor-deaux, either that he was only a fairground merchant, or that the jurats would have refused him permission to settle in our city, by virtue of articles 7 and 8 of the statutes, the title of the merchants, which conferred on them this right.

+

In his will, received by Denhors on July 19, 1561, noble Arnauld de Ferron, advisor to the parliament of Bordeaux, mentions a house, rue Bouquière, "where the Portuguese stays in louaige." » Some time later, we see in our city Jean Gonsalves, native of Oporto *; but this information is too incomplete for any light to be drawn from it.

If, at that time, the number of Portuguese Jews was not considerable among us, it soon increased in a notable proportion. On a date that we cannot specify, but which cannot go beyond the end of the 16th century, a French agent wrote from the Spanish border: “We have nothing new here, except Jewish forces fleeing the Spanish Inquisition... They all go to Bordeaux and other districts of Gascony, where they hope to find retirement. These are, strictly speaking, Ma-rannes, which, under the name of Christians, retain several Mosaic ceremonies and observacions. The worst thing I see about their exile from Spain and Portugal is that several good people are surrounded there to catch, and even those who are considered to have some feeling for religion. So much so that this persecution brings a great reduction in trade in that country, and many of our merchants withdraw from it.

1 Liasse 184-2, leaves vexxxj recto and xxxiii verso.

2 Minutes of Castaigne, bundle 87-14, folio ïïij:xij verso; act of January 28, 1572. — We will say nothing about the Spanish merchants established in Bordeaux, such as Adam Francesco and “Louppes Domayne,” while leading us to believe that they were Christians. The first purchased, by deed from Denhors, dated March 47, 1561 (bundle 184-2, fo:io miiijc xlvj recto), all the cabosse nails that a master keymaker was to make during the year; and the other sold wheat

Machine Translated by Google

to a plowman from Saint-Morillon. (Minuts of Themer, last day of February 1577, bundle 488-16.)

from day to day. Moreover, money is very rare in Spain!" etc.

The Jews had brought many with them to Bor-deaux. Spaniards and Portuguese, they engaged in trade and gave a new activity to that place. Taxed like the other regnicoles, they were, at least some of them, naturalized and thereby authorized to remain and trade in the kingdom; but the jealousy of their new compatriots did not take long to awaken, "slanderously and falsely imposing on them several crimes, to give them the opportunity to abandon the said city and retire to their country", etc.

Several took this course. Those who remained having addressed a request to Henri IT, this prince granted it by letters patent dated from Lyon, November 12, 1574, which the parliament of Bordeaux registered on April 19, 1580, at the request of Diego Mendès Dias, Simon Meira and other Portuguese merchants living in Bordeaux 5. There we find a reminder of other letters patent issued in 1550 by Henri IT, and designed in the same direction.

1 Manuscript from the Cottonian Library, Caligula, E.

8 Privileges, which Portuguese Jews have enjoyed in France since 1550. In Paris, from the Stoupe printing house, x. nec. Lxxvn., in-12, p. 41-16. — Instead of Meira, we suggest reading Lameira. The Meira named in the registration of the Bordeaux parliament was probably one of the ancestors of Antoine Lomeyre, whom we will see again, with the quality of merchant-banker, at the beginning of the 18th century, and of Abraham Lameyÿre, who lived in the middle. See below, p. 424, note 3, and p. 498. |

"As the merchants and other Portuguese, called new Christians, said the king, have sent to us by people on purpose that they were sent from here, made it understood that having known, having for some time trafficked in this in our kingdom, the great and good justice which is exercised in it... so that this

Machine Translated by Google

The envy inspired by the Jewish merchants of Bordeaux nonetheless persisted, despite the services they had rendered. This feeling was still so strong at the beginning of the 16th century that Marshal d'Or-nano issued, on January 2, 1604, an order which forbade all inhabitants from harming Portuguese merchants and others by word or action. foreigners who would like to retire to Bordeaux to live and trade there?.

fact that the course of the merchandise is carried out and conducted in such freedom, that without any suspicion of insults, the merchants can go, trade and frequent in such places of our said kingdom, countries, lands and lords of our obedience that as they please, and in all security exercise their arts and manufactures; considering also that to have at all times our predecessors and We have singularly favored the merchants of our said kingdom, We have, in many cities of it, benefited them with beautiful and great privileges, by means of which they make great gains and increase their traffic day by day; and that for the convenience of the situation of our said kingdom, by which (besides that it is very fertile and abundant in corn, wines and other amenities required for human life, which is a great means to the merchants of that of 'save, being those of other countries forced to make great expenses for the food of their families, people, factors, servants and go-betweens) flow and pass several beautiful and large rivers and navigable rivers, on which a great deal of traffic takes place, and Furthermore, it is for the most part surrounded by both the Levant and Ponant seas, on which the neighboring foreigners of our said kingdom (who more than any other in all of Europe carry goods) ordinarily frequent and trade, so that the means of living well is open to everyone who wants to be employed in any way whatsoever, said Portuguese. has come a singular desire, which grows in them day by day, to come and reside in this our kingdom, and bring their wives and families there, bring their money and furniture... provided that we are pleased to grant them letters of nature -lity," etc. (Privileges enjoyed by Portuguese Jews in France, etc., p. 1-5.)

1 Grains ran out in 1599, and the shortage was so great that the city of Bordeaux was filled with poor people who were dying of hunger. It was decided that they would be distributed to all individuals, without regard to anyone. The Portuguese nation distinguished itself, on this occasion, by a humanity which excited universal admiration. See the Bourdeloise Chronicle, 2nd part, p. 11.

2 Detcheverry, History of the Israelites of Bordeaux, p. 51, 52.

Machine Translated by Google

Such protection could only encourage the Jews of Spain to visit Bordeaux: we also frequently saw them within our walls, especially at the time of the fairs. A troop of Israelite merchants, who went to this city , had an affair which almost had serious consequences for all the Jews who lived there. These travelers had stopped on the way to Bayonne and stayed with the postmaster named Ponteil; They went to bed after having opened all their bundles, either to see them again, or to arrange them differently. The next morning, they made the house resound with their cries, claiming that someone had robbed them and pointing to a half-open window as the path by which someone had entered their home; according to them, their loss amounted to five or six thousand crowns in rings, jewels, pearls and precious stones.

Arriving in Bordeaux, they informed and obtained a decree against the said Ponteil. The unfortunate man was arrested and questioned; but no confession could be drawn from it, and, for lack of proof, he was acquitted, "half ruined in body and expense!"

Some time later, a compatriot, perhaps even a relative of this same Ponteil and his namesake, wanting to take revenge on the conduct of the Portuguese in this affair, came forward as a denouncer of all those in the city of Bordeaux, who formed about fifty or sixty families. Supported by twenty-four witnesses, he accused them of Judaism and the most execrable crimes. Whether these allegations appeared to be false to the justice system or whether it had been circumvented by the credit which

1 P. de Lancre, Incredulity and miscreance of spell, etc., p. 470.

then enjoyed at the court Philotee Elian de Montalto, a Portuguese doctor and Jewish by race, the parliament had Ponteil taken prisoner, while there was only ever a personal adjournment against his adversaries!.

King Dusaut's lawyer supported the accusation as best he could; but as the Jews had long been established in Bordeaux and had entered into an infinity of good houses where they went to sell their goods, they found a way to have their case pleaded by a very good lawyer. "The strongest of his plea," says de Lancre, "was on the slander that was put against them: that they had been in the city for sixty years, leaving

Machine Translated by Google

that they had prescribed their domicile and accommodation; that they are greatly useful there, leaving their goods at a much better price than other merchants," etc.

For his part, Ponteil entrusted his cause to a famous lawyer of the time, named La Roche, whose terrible advisor reproduced the plea in its entirety. This lawyer gave his all to the Portuguese; but he was dealing with a strong party. They did so well that they obtained a ban on the Bordeaux parliament and managed to suppress the consequences of the action brought against them.

Reassured in this respect, the Portuguese Jews of Bordeaux did not remain long without experiencing new apprehensions. War was declared between France and Spain. The Catholic king having placed an embargo on vessels, goods and furniture belonging to the French who were in Portugal and other places in his kingdom, the king of France, using reprisals, or-

1 Incredulity and disbelief of the spell, ctc., p. 488.

gave that an inventory would be made of all the furniture and goods belonging to the Portuguese of Guienne, and to this effect, on May 14, 1625, M. de Gourgue, first president!. To ward off the blow that threatened them, they addressed the municipal administration, and the jurats took, on June 4, 1625, a resolution to the effect that a certificate of good life and morals would be sent to the king and to the members of its Council in favor of these merchants. It is recorded there "that in this city they are useful because of their trade, selling and selling their goods without question to people, trading with all loyalty and fidelity?," etc.

In January 1630, peace between the two crowns having been proclaimed and trade re-established between the French and the English, the bourgeois of Bordeaux complained "of the fact that there are in this city a large number of foreign commission agents who the biggest af-

1 Detcheverry, History of the Israelis of Bordeaux, p. 56, 57. — There were then in the Peninsula a large number of French people, called Gavaches, who had come from Guienne and other provinces. See the Memoirs of Gourville, in the year 1669. (Petitot Collection, 2nd series, vol. LIL, p. 412.)

? Detcheverry, p. 57. — We do not have to speak of the Portuguese merchants of Bayonne; we will say, however, that the names of those who lived in this town, or rather the Faubourg de Saint-Esprit, in 1625, are recorded in the Conterrolle de la recepte of the customs office of Bayonne of that year. (Archives of the department of Gironde, C. Finance Office.) It includes Jacob Luis, Daniel Henriquez, Diego Dacosta, Alfonso Nuñez, Fernando Rodrigo living in Biarrits, Melchior Albernos, Simon Baya, Coello, Ascenso Nuñez, etc. (Folios 3 ro, 5 r°, 8 ro, 10 ro, 14 vo, 12 vo, 20 re, 91 vo, 25 vo, 34 ro, 58 ro, 72 vo, 92 ro, 402 vo, 106 vo, 140 r °, co.) One of them, Bento Luis, did business with Bordeaux, from where he obtained, undoubtedly for Spain, large leather aiguillettes, azure, serges of Saint-Maixent, canvases from Holland and others, and coarse goods. (Folios 52 r°, 77 vo. Cf. folios 51 vo, 57 ro, 59 r°, 78 ro.)

3 Continue to the Chronique bourdeloise, p. 52, ann. 1629,

actions, and, although various ordinances had ordered the Portuguese to empty the city in three months, the number increases every day. They have the most beautiful boutiques and stores there for all kinds of goods!. »

This declaration is joined by those of the ju-rats in their correspondence with Secretary of State Châteauneuf, on the occasion of a sedition whose repression had caused the greatest disorder in Bordeaux: "The Portuguese, who hold entire streets and do a considerable trade, write these magistrates, have asked for their passports... The Portuguese and foreigners, who do the biggest business, are looking for ways to withdraw from here. Gaspard Gonsallès and Alvarez have recently left, who were among the most notable among them. We realize that trade ceases? »

This consideration did not stop the tax authorities. The king, by a declaration of January 22, 1697, renewed by three others, one of January 26, 1637, the second of January 1646, the third of May 1656, had ordered that foreigners established in France since 1600 would pay the sums to which they would have been taxed by the rolls decided in Council; Damour, responsible for recovering it, carried out the most rigorous prosecutions against the Spanish and Portuguese merchants established in Bordeaux. They explained to the Council that they were not in the case of the declaration, since they had been naturalized French since 1550; but the be-

care of the State made the government forget commitments that it should have respected. At the request of the Portuguese, a decision of the Council was issued, by which His Majesty reduced to 20,000 pounds, with 2 sous for the pound, all taxes made and to be made on the Portuguese, in execution of the declaration of July 22, 16971 .

With peace the fugitives returned, and other Spanish merchants of the same religion later increased the little colony*. In 1636, the number of its members did not exceed two hundred and sixty Ÿ. In 1648, Coste Furtado, a Portuguese banker, pleaded against Thomas Craf, an English merchant-commissioner. Around the same time, Jacques Castaigne, a Portuguese merchant and bourgeois from Bordeaux, traded in olive oils, and generally in colonial goods, such as almonds and soap, and had as a principal, in Dax, a certain Pierre Gomez* . In 1664-65, David Lopès was a shipowner and loaded wines and spirits on the Plume-Couronnée. In 1684, the nation consisted of twenty families; at least this is the figure which comes back to Bordeaux in the number of expulsions pronounced by the judgment of the Council of State, dated November 20 of the same year?. We do not see the Despi families appearing there.

2 [bid., t. V, no. 79, p. 4. — Isaac Lacam, with his father-in-law Jacob Ratier, “bourgeois and merchant of Bordeaux,” named above, p. 505, appears in a receipt received by the notary Grégoire, dated February 6, 1700. In another later act, he is described as a squire, advisor, secretary to the king, of the court of aids and finances of Guienne, resident Saint-Siméon parish.

(Minutes of Michellet, December 1, 1711.)

8] There were also, in Amsterdam, Pintos, esteemed to the point of being honored by the visit of the Prince of Orange and his family.

In a document received by Couthures, on December 8, 1666, Joseph Mirande, merchant from Toulouse, is presented as the son of the merchant from Bordeaux. — In 1732, two Portuguese Jews from our town, Mr. Nonès and Mr. Pinto, giving up their family and their fortune, which was considerable, went to their aunt, superior of the convent of N.-D. du Refuge, in Toulouse, were instructed in the Christian religion and asked for baptism. It was conferred on them with great pomp by the archbishop on April 12, 1732, and the two neophytes had the capitouls as godfathers, in the name of the city. (Beau-fleury, Hist. of the establishment of the Jews in Bordeaux and Bayonne, p. 40, 41.)

— Two years previously, the three daughters of an Israelite merchant whom we already know having taken the veil, the family had requested from the authority, and Louis XV issued an order, dated July 15, 4728. “Bicn, it is said, that His Majesty, for good considerations, approves that the three daughters of Alexandre Mezes remain in the Ursuline convent of the city

from Bordeaux, where they are voluntarily entered, and from where their mother strove to remove them by a means of surprise which would have brought upon her an exemplary punishment if His Majesty did not prefer clemency to severity, His Majesty makes very express inhibitions and prohibitions to all superiors, religious men and women, convents and communities, from receiving in the future in their houses the children of Jews, under the pretext of religion, before the age of twelve. »

(Privileges enjoyed by Portuguese Jews in France, etc., p. A1.)

Machine Translated by Google

enter Bordeaux with goods from India! : these Portuguese, like those who were forbidden to broker bills of exchange?, were surely Jews.

The following year, a sieur de Pressigny came to join the crusade undertaken against the Jews of Guienne. He . showed that their establishment in Bordeaux, Bayonne and elsewhere could have dangerous consequences, in that such a considerable number came from Spain and Portugal, that they would soon equal, he added, the number Christians in this province. By decree of the Council, dated February 21, 1722, the king ordered that the intendanis and commissioners dispatched for the execution of his orders in the generalities of Bordeaux and Auch would set up, in pursuit and diligence of the sieur de Pressigny , statements of all the Jews who were established and domiciled there, with circumstantial details, notably on the main business in which they were involved; but these having invoked the declaration of Henri IE, of August 1550, confirmed by letters patent of Henri II, of November 11, 1574 and April 19, 1580, and by others of Louis XIV, of December 1656 , obtained from his great-grandson a new confirmation, for the sum of one hundred thousand livres and two sous per pound more, in favor of the joyful accession of the king to the crown. His letters patent, given in Meudon in June 1723, were provisionally

recorded at the Bordeaux parliament, then on vacation, on September 11th!

* The same year, some Jews from Bordeaux addressed a request to the Comptroller General requesting that they be allowed to sell, within the scope of the jurisdiction of the Parliament of Paris and other parliaments of the kingdom, goods which they bought at the fairs, and, for this purpose, to stay there for a month of each season. The commissioners to whom this

Machine Translated by Google

request had been returned were of the opinion to reject it?.
Two years later, the Jews of Dijon also presented a request to the authority.
After recalling that, by letters patent of June 1723, the king had granted to Jews
domiciled in France the privilege of selling and trafficking for one month of each
season, in all the cities, towns and villages of the kingdom, they explained that
three Jews from Bordeaux, having gone to Dijon, had asked the parliament of
Burgundy for authorization to sell in the jurisdiction, by virtue of these letters, of which
they had obtained confirmation by means of the payment of a sum of 100,000 livres
for the joyful accession of the king to the crown; they also relied on a
consistent decree rendered by the parliament of Bordeaux on June 22, 1724. They
added that having come to Dijon with goods to trade there, and having learned that the
merchants of this city had intended to make them, of the opposition, they
had been obliged to resort to parliament to obtain that

1 Privileges, which Portuguese Jews enjoy in France, etc., p. 25-32.
2? Register of the Commercial Council F, 42. 75, p. 1.038; session of December 30, 1728.

the judgment cited above was executed according to its form and content, with the
prohibition of causing any disturbance or impediment to their trade.

For their part, the merchants of Dijon presented a request by which they
asked that before deciding on that of the Jews, they be ordered to communicate
to their adversaries the letters on which the children of Israel based their privilege, and
to justify that they were really of Jewish nation; but without stopping at the request of
the merchants, the parliament of Dijon issued, on July 24, 1730, a ruling in accordance
with the conclusions of the Jews. Strengthened by this decision, our three Bordelais
sold in Dijon, during the month of August, and sold with such advantage that
their competitors saw themselves on the verge of ruin.

In their efforts to ward off it, they represented that Burgundy's trade was extremely
limited; They then pointed out the inconveniences which, in their
opinion, the trade of the Israelites entailed; they spoke of the large number of buyers
that the Jews attracted by the false appearance of cheapness,

Machine Translated by Google

conduct which they maintained with the merchants pressed by their creditors, the fraudulent bankruptcies which they occasioned and which they were always ready to favor; finally, the damage which resulted from it for commerce in general; but despite all these allegations, more or less founded, the three Bordeaux Jews were upheld their rights! by two judgments of the

1 Register of the Commercial Council F. 12. 77, p. 127-131; session of December 21, 1750. Cf. F. 12. 78, p. 100; February 8, 1731. — In December 1727, Mr. Desforts. then controller general, had sent to Mr. Boucher,

parliament of Dijon, dated June 22, 1724 and July 29, 1730. Joseph de Lezia and other Jewish merchants established in Bordeaux were also allowed to trade, sell and negotiate, for one month each season of the year, in all cities, towns and places within the jurisdiction of this parliament. These judgments, having been referred to the Council of State, were overturned on February 20, 1731, and Jews were prohibited from selling and selling goods in any city or place in the kingdom other than those where they were domiciled.

Two lawsuits filed. to one of the notable merchants of the Jewish nation came to alarm the Portuguese Israelites about the solidity of their privileges, and to give new force to the animosity of which they were the object. A Mr. Gaubert, who had great obligations to the family of a certain Medina, had made, on September 16, 1729, in favor of the widow of this merchant, a donation inter vivos of the majority of his property, reserving the enjoyment during his life, and also reserving a small sum to dispose of at his death. After his death, a very distant relative brought suit against the widow Medina to have this donation annulled, claiming that, as a Jew, she could not inherit from a Christian, and that the privileges granted to Jews

intendant in Guienne, a memorandum from the merchants in detail of Bordeaux, requesting permission to establish themselves in Jurande; and the latter, after having communicated it to the jurats and directors of the Chamber of Commerce and having ensured their consent, had sent, on April 9, 1728, to Mr. Desforts a favorable opinion: in his session of February 98, 1732, the Commerce Council resolved to postpone the draft statutes sent to Mr. Boucher, until it had been seen whether some measures could be taken regarding Jewish commerce. (Reg. F. 12. 79, p. 212, 213.)

only understood each other about the faculty they enjoyed of inheriting from each other.

The case was judged at the seneschal of Guierine, in favor of the widow Medina. Call to parliament. During the course of this appeal, the chancellor requested that the judgment be stayed and that the matter be reported to him, which was done. Since then, the king issued a decree in which he referred the trial to him and his Council, prohibiting knowledge of it to the parliament of Bordeaux!.

The facts of the other trial are thus set out in a request to the Keeper of the Seals by the widow of a lawyer at the same parliament, dated June 17, 1733. On October 7 of the previous year, the husband had made a will by which he established Joseph Médina, "Judaizing Jew, of Bordeaux," his universal legatee and his executor, leaving his wife only a small property located in the parish of Bègles, "to hold for him all his rights and claims. » After the death of the test-. tator, Medina took possession of this inheritance, with a value of more than 50,000 crowns and an annual income of 7,150 livres; at the same time, if we refer to | the request, he aroused the widow's creditors who sued her against the seneschal of Guienne. Deprived of the enjoyment of the small farm which had been bequeathed to her, reduced to alms, she addressed the Keeper of the Seals, but only after having waited a long time for the outcome of the affair, in the hope that His Majesty would make known his intentions regarding the Jews tolerated in Bordeaux, and would decide whether they could extend their privileges until

with the hope of the same success. At first they were hardly noticed except by their discords; but, having become rich, the Langes, the Astrucs, the Dalpugets, the Cas-sins, the Petits, the Boyers*, gave umbrage to the other merchants, both Bordeaux and Portuguese. They were denounced, and, following complaints, on January 21, 1734, a decision was issued by the Council of State ordering the expulsion of all Avignon Jews, Tudescans or Germans, established in Guienne*. Under this judgment,

3 Judgment which refers to Mr. Lamavoine de Courson, intendant in Guienne, the disputes between Mr. Lange Mossé, Joseph Dalpuget and Joseph Petit, Jewish merchants established in Bordeaux, and the Jewish community of Avignon. (Reg. of the Commercial Council, December 30, 17147.) — In 1720, the first of these Israelites, domiciled rue des Augustins, having purchased in participation with the sirs Sema Dalpuget, Joseph Dalpuget father and his son, associates , a small box of lace, complained of their bad faith. (Minutes of Banchereau, November 28, 1727.)

3 See the count of these families in the stewardship papers, (Archives of the department of Gironde, C, portfolio 372. Cf. Recueil 3,076, vol. III, folio 28 verso, and vol. V1, nos. 45, 37 , 57, 64.)

Intendance, C, portfolio 372. (Petition signed by Joseph Vidal and Lange Mossé, to the intendant, concerning the Jews of Avignon, of whom they give the count, with details of their affairs (April 20, 1722). — Reg . C of the Chamber of Commerce, folios 190 verso, 192 recto (Dec. 30 and 31, 1733), 195 recto (January 21, 1734), 198 verso (February 48), 200 recto (March 4), and 202 recto (4th). April). — Like Lange Mossé, Joseph Vidal and Blanche Rabel, his wife, lived on rue des Augustins (Minutes de Banchereau, Feb. 18, 1727.) — At the end of the century, we find an Abraham Vidal, Portuguese Jew, merchant. in Paris, whose succession gave rise to a memoir, which was printed in 1784, in-é°, and to a decree of parliament, dated February 18 of the same year.

5 This judgment, which was printed in a placard, is found in the volume of

sixteen Jewish families were taken out of Bordeaux, among which was that of the Dalpugets, whom the drapery and silk merchants, promoters of the decision, had mainly had in mind, because it was a big trade in these goods, which, rivaling theirs, necessarily harmed it!. These Dalpugets, and some other Avignon Jews established in Bordeaux, twelve in number, made the greatest efforts to have the judgment revoked and obtain the benefit

Machine Translated by Google

of the king's declaration of June 1723.

In a memoir published for this purpose, they explained the reasons for the jealousy and incessant attacks to which they were subject from the merchants of Bordeaux: “The remonstrants go shopping; they carefully follow the time of the fairs; they do their business by themselves, and live thriftily; they do without clerks and waiters; the smallest dwelling is good for them, provided that they find there enough to make a store and store their goods; they make no expenditure, neither outside nor inside; occupy yourself with the sole object of their commerce, all pleasures are forbidden to them; and content with a small profit, they are able to sell cheaply: hence the sale of their goods, hence the assistance of buyers, hence the

Archives of the Ministry of Foreign Affairs, Guyenne, vol. CLXIV, folio 221. 11 gave rise to an order from the intendant, dated May 19, 1734, following which an inventory was made among the Jews of Avignon, the official report of which is preserved in the archives of the prefecture of Gironde, under code C, portfolio 372.

preference over other merchants, who, brought up and accustomed to a totally different life, are obliged to hold their merchandise on too high a foot. »

Coming then to the reproaches addressed to the Jews, of publishing defective articles, the editor of the memoir speaks out against this accusation and declares that "when the case was found (which we almost never saw, and which nevertheless can reach the most accurate merchant), the remonstrants immediately took back their goods, "

Neither the reasons they put forward, nor the length of their residence, nor the good certificates they brought back of their commercial probity, nor even the promise to swell the ranks of Christians *, swayed the persecutors; all these Jews had to leave Bordeaux, with the exception of nine families, who obtained a reprieve of nine

get, father and son; Joseph and David Petit, father and son; Ange Mossé; Nathan Ace-trick; Solon d'Alpuget; Joseph Casting; Leon Petit; Léon de Carcassonne and Manuel d'Alpuget. [Paris.] From the printing house of the widow Knapen, rue de la Hu-chette, 1734, folio, p. 6, 7. (Archives of the Ministry of Foreign Affairs, Guyenne, vol. CLXIV, folio 324 verso and 393 recto.) Cf. Certificates reported by Srs Dalpuget, father-in-law and son-in-law, proof of their former residence in Bordeaux, of the regularity and probity of their trade, of the accuracy of their payments and commitments, of the satisfaction of the Lords, Communities and individuals who have provided themselves with different clothes and merchandise; and finally of the advantage that it would be for the province and inhabitants of Bordeaux if they were re-established there. Printed with 6 folio leaves. (Gironde departmental archives, Intendance, C, portfolio 372.)

2? The prioress of the Carmelite convent of Bordeaux had requested that the widow Lange be allowed to trade in this city, and this in consideration of the fact that this Jewess had a daughter whom she offered, at this price, to endow to enter religion. The commissioners of the Council of Commerce were of the opinion not to deviate from the decision that had been taken not to allow any Avignon Jew in Bordeaux. (Register F. 12. 88, p. 46; session of February 16, 1741.)

months to put their affairs in order!. They withdrew to the generality of La Rochelle, despite the decree of parliament, of August 22, 1729, which prohibited Jews from settling there in perpetuity or for a time?, and, treated better than in Bordeaux , they obtained a sentence from the police judge of Saintes, which allowed them to open shop; but this sentence was overturned by a decision of the Council, dated May 31, 1735, stating that the Jews established in the towns of Saintes, Rochefort, Cognac and others in the generality of La Rochelle and the country of Au-nis, would be required to leave without delay. They are in no hurry to comply with all the rigor of the order: while leaving the towns where they had withdrawn, they had left there the goods that they claimed to have taken with them during their expulsion of Bordeaux, and this with the aim of creating a pretext for asking for a period of six months in order to sell them. Informed of this, the Council of Commerce, in its meeting of August 30, 1736, decided to propose to the controller general to inform Mr. Bignon, intendant at La Rochelle, of the reluctance of the assembly to grant the Avignon Jews -but this grace, with the request to issue an order which, recalling the provisions of the judgment of 1735, would enjoin them to justify, in two months, the sale and removal outside the kingdom of their goods, under penalty confiscation and without further delay 5.

2 The judgment specifies "Joseph and Jacob Dalpuget, father and son, and other Jewish merchants in company, calling themselves merchants of silk sheets in company, from the city of Bordeaux. » It was printed in Paris, by Pierre Simon, in four pages in-4°.

at Register F. 12. 83, p. 525, 526.

This decision had barely been taken when Jews from Avignon, Joseph-Jacob and Emmanuel Dalpuget, father-in-law and son-in-law, presented a petition to the Comptroller General to ask to be reinstated in the drapery and silk trade that they made in Bordeaux before the judgment of January 21, 1734. The Chamber was responsible for verifying the facts put forward by the petitioners and giving its opinion on their request; she concluded that it was necessary to stick to the execution of the said judgment, and a memorandum was given to the intendant to serve as a response to the petition.

Summoned to this magistrate, the jurats and directors of the Chamber persisted in asking for the contested regulation to be maintained! |

A few years later, on the complaints brought to the controller by the merchants of the various towns of the kingdom, among others against the Jews, the intendant asked the Chamber: 1° if in relation to what was practiced in this department, There would be some inconvenience in giving them the freedom to attend fairs, which are generally open to everyone; 2° if we were to take away the freedom of fairground pedlars to spend and stay for a certain time in the towns. and villages, outside the time of fairs; 3° if assuming this freedom left to each, the precaution of having their goods carefully inspected, upon their arrival, by the merchants' guards would not be sufficient to prevent contraventions of the regulations, which were the only reason for the exclusion requested against them. The Chamber responded with a brief still imbued with the same

ideas', and persisted there, when, in 1744, two Jews from Avignon, Rogé and Abraham, addressed a request to the intendant of Guienne, to ask permission to sell wholesale and retail draperies, silks, gilding and other items, during the Bordeaux free trade fairs. More liberal, it must be said, Mr. de Tourny replied that the spirit of the 1734 judgment was quite severe in itself without extending it further, that it had no other aim than to to prevent Avignon and German Jews from establishing themselves in Bordeaux, but not from coming to fairs there, and that, in his opinion, the general interest should prevail over the particular interest, being well understood moreover that the goods of the said Jews would be subject to visits by the guards and jurors of the corporation ©.

The separation of the Avignon Jews from Bordeaux only lasted a short time, mainly that of Jacob-Joseph and Emmanuel Dalpuget. Well seen in this city, where their only enemies were the merchants of draperies and silks, they returned at first as if in passing, and, after various interrupted stays, they returned home and were left in peace when saw them turn all their business towards banking and armaments. But, fearing to be disturbed at any moment, they asked, in August 1748, to be exempted from the prohibition of the judgment of January 21, 1734.

Minister Saint-Florentin sent their brochure to Mr. de Tourny, who communicated it to the jurats of Bordeaux and to the Chamber of Commerce, issuing a favorable opinion.

recto (February 27 and March 5, 1744.

It must be believed that this opinion carried the weight of others!; because on April 22, 1749, a patent from the king was sent to Jacob and Emmanuel Dal-puget, father-in-law and son-in-law, by which they were assimilated to the Portuguese Jews and relieved of the rigor of the Council's decision of January 21 1734, on the condition nevertheless that they could not carry out, either through themselves or through intermediaries, directly or indirectly, the trade in draperies or silks wholesale or in bulk.

Machine Translated by Google

detail, under whatever pretext; and on the condition that they would confine themselves to the trade of the bank and the islands of America, in which they had been engaged for some time, all on pain of nullity of the patent °.

This patent opened the way for other Jews from Avignon, such as Nathan, Salon Astruc and Moïse Lange, who similarly obtained permission to reside in Bordeaux to engage in maritime commerce and banking. Success

1 See in register E of the deliberations, folio 58 verso, that of the Chamber of Commerce, dated February 11, 1759.

2? The patent, dated July 12, 4750, is in the Departmental Archives, Intendance, C, portfolio 372.

3 Detcheverry, History of the Israelites of Bordeaux, p. 75-71. — A decree of the Council, registered in Bordeaux, on July 21, 4667, ordered that no bourgeois would be received any more, who, in addition to the qualities required by the statute, did not have 1,000 livres on a ship, and that no one should be admitted to the offices of jurat and judge of the Stock Exchange, if he did not have a share in a building up to the sum of 2,000 livres, and the consuls of 1,000. (Conf. Chron. bourd., etc., p. 100. Cf. p. 102, 105.) At that time, such a figure was quite considerable. A lawyer, having just said that a bourgeois had, from 1654, more than 40,000 crowns of property, part in houses and farms, part in cash and merchandise, adds: “He was one of the richest and more accredited merchants from the city of Bordeaux. He had, to remain in rest, 6,000 pounds of income; by working, his funds and his intelligence produced him a considerable profit in trading,” etc. (Factum on the call for young ladies Marie and Françoise Valloux, summer. Bibl. publ. of the city of Bordeaux, Ju-rispr. n° 3,078, 2nd collection.)

of their request, which has been preserved to us, inspired other Jews to send a similar one. The petition of Lyon Petit, the David Petit brothers and Salon Dalpuget, followed the same path; but the jurats, consulted, concluded that the request was rejected, and the opinion of the business directors was found to be in conformity with that of the jurats?. This state of affairs lasted until 1753; At this time, some of these Avignon-born Jews were granted temporary permissions or patents to trade in the city; but they wanted more, and in 1757, they presented a petition to the king to obtain the right of citizenship and freedom of trade equal to the Portuguese Jews. They encountered the same opposition in the Chamber of Commerce. Finally in 1759, they obtained letters patent which admitted six families of theirs to

* Letters patent in favor of Jews or New Christians from Avignon, established in Bordeaux. Given at Versailles in May 1759. Registered in parliament on July 14, 1759. (In Bordeaux, at J.-B. Lacornée, etc.; 4 pages in-4.) — Detcheverry, History of the Israelites of Bordeaux, p . 78, T9.

a decree to expel them, and the newcomers, numbering approximately one hundred and fifty-two, had to move away. There was only an exception for a German Jew named Ephraim, to whom the marshal, by a second order of September 28, allowed to remain temporarily in Bordeaux, to fulfill commitments contracted with several foreign and local correspondents. , relative to a considerable supply of broken wine!. |

If Beaufleury is to be believed, Ephraïm, a German Jew, established for a long time in Bordeaux, had requested, for himself and his family, letters patent of naturalness conforming to those which had been given in favor of the six Avignon families. They were granted to him, with this restriction, however, that he and his family would enjoy them throughout his life, but that their effect would cease for his children after his death. It does not appear that these stipulations were observed; because, even before the end of the year 1761, Ephraim was informed that he would have to take the path of exile.

staying “with Sieur D’. Astruc, rue Bouhaut, in Bordeaux. »

Before this time, we see a well-known name appear today in finance. In July 1760, Jews from Bordeaux, preparing to travel to Paris, requested passports: they were David Lopes, Samuel Pereire and Abraham Astruc; in the three certificates presented to the jurats and transmitted to the Count of Saint-Florentin, they announced that they wanted to stay for a while in the capital to trade in silk and jewelry!. All Jews, in general, who came to Paris, could only stay there by means of the limited passports which were granted to them, and they were subject to a very special policy.

More comfortable in Bordeaux than elsewhere, the Israelites preferred to stay in a city where they were on an equal footing with the most notable citizens, and turned more readily to the side of Spain and the colonies.

They continued the same type of business as their ancestors, especially banking and armaments; and their capacity, as much as the success of their enterprises, ensured them a distinguished place in the world whose annals we have attempted to trace.

water level, at any tide. [In Bordeaux, at the widow Calamy, etc., 1776.] 17 pages in-4°.

CHAPTER XLVII

THE TREATY OF METHUEN; CONCLUSION.

Omission of the Memorandum drawn up by the Chamber of Commerce of Guienne in 1730; the Treaty of Methuen presented as having ruined Portugal; Was it so disastrous for Bordeaux, and were its effects immediate? — Bordeaux trade statistics at the beginning of the 18th century; state of imports of wines from France to the English customs, from 1686 to 1786. — Importance of the first two ten-year periods. — Time of the introduction of Portuguese wines into the British Isles; disastrous effects of ideas

prohibitives of Colbert and the revocation of the Edict of Nantes; propagation of vitic in Portugal. — In the first years of the 18th century, the export of French wines in England there is no diminution; it is even increasing; treaty concluded with this country under the influence of Turgot's ideas. — Happy effect of this treaty for the pr

Machine Translated by Google

Bordeaux perity; new economic ideas, renewed by Colbert, inaugurated by the French Revolution. — Montesquieu and Turgot long unknown in their country.

We have exposed in the greatest detail the vicissitudes of the Bordeaux trade, from the first century AD until the year 1730, the date of a remarkable work, which presents a faithful image of this trade at that time. ; but the Memoir of 1730 is silent on a most serious event, which was to have unfortunate consequences for the prosperity of Bordeaux, whose wines form the main wealth. We want to talk about the famous treaty of offensive and defensive alliance concluded on December 27, 1703, with Great Britain, by the care of its ambassador Paul Methuen!, treaty

1 This treatise has been published many times, notably by Martens, Collection of principal treaties of alliance, etc., 1st edition, supplement, vol. 1, p. #1; by Hertslet, Complete Collection of the Treaties and Conventions and reciprocal Re-gulations at present subsisting between Great Britain and foreign Powers, etc., vol. IE, p. 24; and by Jose Ferreira Borges de Castro, Colleccdo de tratados, etc, Lisboa, na Imprensa Nacional, 1856-1858, in-8°, t. II, p. 1953.

which brought Portugal into the great alliance against France, and which is represented as having paralyzed, for half a century, the industry, agriculture, commerce and navigation of a country formerly more flourishing than ours'. Was the blow that this treaty brought to the commerce of Bordeaux so disastrous and was it felt immediately?

edge? This is what we intend to seek.

Among the statistics, some of which are provided to us by the registers of the Chamber of Commerce?, we choose the reports of imports of wines from France to the customs of England during a century, from 1686 to 1786, in order not to concern ourselves only ten ten-year periods which alone fall within our subject.

The first two, that is to say those from 1686 to 1696, and from the latter date to 1706, have great importance, because, on the one hand, the revocation of the edict of Nantes, on the other hand, the maneuvers of Louis XIV and his wars undertaken to save James II, to whom he later gave asylum in Saint-Germain and the title of

Machine Translated by Google

King of England, determined the British government to come to an understanding with Portugal and to conclude the Treaty of Methuen with it.

1 Adrien Balbi, Statistical essay on the kingdom of Portugal and the Algarve, etc. Paris, 4829, in-8o, t. I, p. 24. — This assertion by the author is refuted at length in a publication of the Bordeaux Chamber of Commerce, entitled: Memoir on the possibility of concluding a commercial treaty between France and England. Bordeaux, Suwerinck printing house, June 1844, large in-8; see p. 94100.

? State of the prices of various goods arriving from foreign countries in the port of Bordeaux, in the year 1715. (Second register of the memories of the Chamber of Commerce, folios 33 verso and following.) — Summary of the price of goods leaving Bordeaux in the year 1717 and those who entered there. (Ibid., folio 78 recto.)

It was from this time that Portugal was able to introduce, to our great detriment, its wines into the British Isles. The prohibitive ideas of Colbert and the emigration of five hundred thousand Protestant industrialists combined, moreover, to give superiority over our manufactures of all kinds to goods of English manufacture. This is how privileges were granted to Portugal and trade took place for the benefit of manufacturers across the Channel, while our sheets and silks, always admitted to the Peninsula!, were excluded from the markets of Lisbon and Oporto, and that the cultivation of vines spread rapidly, especially along the Douro.

1 See the Treaty of Madrid (January 14, 14595), art. 24, in Isambert's General Collection of Ancient French Laws, vol. XII, p. 266. — At the beginning of the last century, our sheets were in favor in Spain, especially because of the disposition of the Spaniards to dress in the French style: at least this is what two manufacturers from Sedan, the sirs Poupart and Catel, who requested the restitution of the exit duties collected at the offices of Poitou, and those of contablie collected in Bordeaux, on seven bales of cloth which they had sent to Spain, and this to the prejudice of the exemptions enjoyed by privilege for those interested in the Sedan factory. (Register of the Conseil de commerce F. 12.53, folio 205 recto; December 2, 1707. Cf. folio 213 verso: 23 of the same month.) A decision of the Council of State, dated March 3, 1739, granted the sheets of this provenance the possibility of duty-free transit, which did not exist even before for sheets from the South sent to Bordeaux merchants. (Register F. 12. 87, p. 129, April 7, 1740; and register B of the deliberations of the Chamber of Commerce, folio 81 verso, March 23

Machine Translated by Google

1719. Cf. folios 85 and 86 recto.) At that time, the biggest deals of this kind took place in Bordeaux during the fair, and the factory inspectors resident in this city reported to the general controller on the contracts concluded. in March or October. (Register F. 12. 81, p. 668-670; August 26, 1754.) It is surely to facilitate transactions, already well hampered by obstacles of more than one kind, that at the approach of the one of these fairs, the Commercial Council deliberated on issuing a decree establishing, in Bordeaux, an office, for the purpose of inspecting all the woolen fabrics, etc., and of affixing the lead of the control. (Register F. 12. 81, p. 42; January 18, 4734.)

II. 99

It should, however, be noted that in these two periods from 1696 to 1706, there was no decrease in our wine shipments. Similarly, after the Treaty of Methuen, from 1706 to 1726, for example, we see no noticeable slowdown in these kinds of affairs, despite the calamities of 1709! and the considerable increase in the consumption of wines from the

Peninsula among our neighbors? ; a few years even

1 The parliament of Bordeaux wrote to Louis the misery of your people, it is the duty of your parliament to present it at the feet of your throne and to request from your justice relief proportionate to their needs. Wines form the main income of this province; the ease or ruin of the owners depends on their facilitated or suspended export; the cultivation of vines requires very considerable advances, and the sale of wines, always uncertain, is necessarily linked to the state of trade.

“What immense losses this trade suffered in the last war! and despite the embarrassment, the constraint and the poverty of your subjects, what patriotic efforts have they not made to pay the subsidies! Your parliament, Sire, cannot hide from you that the return of peace has not brought back the comforts: the commerce of this capital is still without activity, several vessels are in this port exposed for sale; their returns, for several years, have only brought shipowners a statement of their loss; construction has stopped; the opportunities are no longer the same; the colonies that remain are open to the greed of foreigners; the foodstuffs no longer sell, or the price obtained from them does not compensate for the costs. However, taxes are excessive, and your people are exhausted.

“The bad weather of the seasons in this province further aggravates the public calamity. All the fruits of the earth have been successively destroyed or altered; the winter of 1766 can be compared, in its effects, to that of 1709; half

Machine Translated by Google

vines were uprooted as a natural result of the decline of commerce; the scarcity of wines has not even been able to procure sales, and, as an added misfortune, the frosts have just taken away the hopes of the next harvest. »

? “Portugal and Spain supply twenty thousand barrels of wine to England, France does not supply a thousand; however I am sure that the English prefer French wines to all others: the reason for this difference

show an increase, and, in fact, until 1786, French wines seem, throughout the century which ended around this date, to have continued to be in demand in Great Britain and in Ireland, contrary to the apprehensions of an administrator well able to judge things. It even seems that, since then, the export has only increased, and the determining cause of this progression can obviously be no other than the treaty concluded under the influence of the ideas of which Turgot had been the most glorious representative.

This treaty, so much reviled, so much slandered by the prohibitionists or protectionists of today (because there are still many of them), was a source of wealth for Bordeaux. It was this treaty, even more liberal than that of 1860, which strengthened our navy, already so flourishing during and following the American War.

The Constituent Assembly was faithful to this liberal policy in the tariff of 1791; but the war shattered his plans. The Convention, in hatred of England, hey- .

Ferent consumption is caught up in what we touched on above about exit rights and delay. There is another reason, which is the lack of trade regulations: our wines pay fifty pounds sterling, or four hundred crowns, per barrel, to enter England, while those of Por-tugal and Spain only pay twenty-one pounds sterling. » (Memory on wines in relation to land cultivation and trade, preserved in the Archives of the Gironde department, box 533.)

1 a The vines, said Mr. de Tourny, when he asked the Defense Council to plant them, the vines will soon ruin the whole of Guienne. This commodity is not an absolute necessity: the brandies that are made from these wines will never have a well-regulated course; and yet the taste for agriculture is lost, the population decreases. » (Historical essay on the administration of Monsieur le Marquis de Tourni, etc., by M. Marie de Saint-GeoYgez. In Brussels, M. Dcc. Lxxx11., in-8°, p. 16, 17. Cf. Bernadau, Le Viographe bordelais.

Bordeaux, 1844, in-8, p. 52.)

Machine Translated by Google

ruined our trade in probitions; the old ideas of Colbert regained favor, and the revolutionaries seemed to take on the task of restricting commercial relations, instead of extending them, for the greater good of the nation, as Turgot had attempted and as the had demonstrated so clearly by Adam Smith.

In short, we cannot help but groan when considering Montesquieu and Turgot in the middle of the century which saw them born, and when thinking of the fate reserved for their ideas. One found in his meditations and his genius the truest notion of political freedom; the other, striking from . faced the prejudices received, applied with sagacity the doctrines which make nations prosperous today; and yet they were first misunderstood in their own homeland', to the point that it took nearly seventy years

t Intendant Boucher wrote, on April 18, 1727, to the controller general: “I received, with the letter that you did me the honor of writing to me on the 7th of this month, the petition presented by the sieur de Montesquieu, to request permission to plant thirty moor logs in vines that he purchased on December 24, and the memorandum by which he claims to justify that the decision of the Council, of February 27, 1725, which prohibits making new vineyard plantations in the generality of Guienne, is contrary to the good of this province and the kingdom.

“As Sieur de Montesquieu has a lot of intelligence, he does not bother to deal with paradoxes, and he flatters himself that with the help of a few brilliant reasons, it will be easy for him to prove the most absurd things. I beg you to excuse me from responding to his memorial and from entering into battle with him; he has no other occupation than to seek opportunities to exercise his mind.

For my part, I have more serious things that must occupy me, and I will content myself with telling you that before he had made this acquisition, and even before the judgment which prohibited the new planting of vines had been returned, it was the common feeling of the whole province that not only should we not allow new vines to be planted, but that it would have been desirable that we had uprooted at least a third of those which have been planted since 1709.

His personal interest today makes him change his language, and not his feelings, because I am convinced that he still adheres to the same principles, and that

to form a majority of followers in France. On the contrary, and immediately, many disciples grouped themselves around their name, as around

Machine Translated by Google

a flag; they brought their ideas to fruition and became great men themselves, drawing inspiration from these great minds.

the memoir he presented to you is a mind game whose falsity he knows better than anyone. But he must not be listened to, and there is much less reason to grant him the permission he requests than to an infinity of people who would like to plant vines on land that they have owned for a long time; and as long as we deviate from the execution of the judgment of the Council to which you ordered me to hold hands by your letter of March 2, the little arable land or meadows which remain in this province, at least around this city, would soon be converted into vineyards.

"The Sieur de Montesquieu only purchased the land he wants to put into vines last December. If in fact they were only suitable for vines, he should not have acquired them, since he was not unaware of the provision of the judgment of February 27, 1725, which prohibits these types of plantations. He can put them in wood or put them to any other use that he finds more suitable, without being able to complain about the little income he will get from them, since this entire acquisition only costs him 60 pounds once paid. , and 2 export deniers and 4 sol de rente per newspaper. He also acquired seventy other newspapers in the same place, which he had also asked me to be able to plant in vines, and he only restricted himself to the thirty newspapers for which he is asking your permission today, only because that he recognized that the demand for a hundred newspapers would appear exorbitant; but he flatters himself that if he was allowed to plant thirty of them first, he could obtain the same permission for the rest, because it would no longer be appropriate to force him to plant beis in the surplus, because of the harm that his vineyard could receive. I have the honor," etc. (Archives of the department of Gironde, box 522. In the following are two memoirs, one of which seems to be that of Montesquieu.)

END OF VOLUME SECOND,

ADDITIONS ET CORRECTIONS

Volume 1, preface, p. 1v, at the end.

In a Discourse on the antiquities found near the priory of S. Martin lès Bourdeaux, in July 1594, p. 42 verso, there is mention of the sieur de Donzeau, private lieutenant, the same year, in the seneschal of Guienne. The name of the notary is therefore indeed Donzeau, like that of Alexandre and Jean Donzeau, who appear in acts received by their namesake, on February 21, April 2 and 18, and June 27, 1517. However, we will continue to write Douzeau.

The growth of the Mediterranean economy in the early first millennium BC

Susan and Andrew Sherratt

Downloaded by [Iowa State University] at 05:26 19 October 2014

One of the most crucial but poorly understood phases in the development of the Mediterranean economy is the transition from the Bronze Age to the Iron Age. During this period of fundamental social transformation, the command economies of the second millennium gave way to less centralized forms of economic organization which were to characterize a new period of accelerating growth that lasted for the whole of the first millennium BC (Hicks 1969: chs 2–4). The development of early Iron Age trading systems is vital to an understanding of the nature of the Ancient Economy, with its attendant controversies (Finley 1985; Lombard 1971).

The new pattern had already begun to take shape in the centuries before 1000 BC, in the processes which underlay the disappearance of the Bronze Age palace centres and the new social forces which were released by their dissolution (Sherratt and Sherratt 1991). Fundamental to this new pattern was the dissociation of trading activity in high value materials from the control of the state. While the Bronze Age coastal cities of Cyprus and the Levant had achieved a considerable degree of commercial autonomy within contemporary political power blocs, the continuing differentiation of commercial and political structures now came to characterize the internal organization of individual states themselves. This had important consequences for the nature of the documentary record, since trading activity was no longer reflected in state records and the literature of the ruling class, so that the economic history of the first millennium has been systematically distorted both by the nature of the evidence and the theories which have grown up to rationalize it (cf. Rowlands 1984). It is here that the evidence of archaeology can offer an important contribution to understanding the processes leading to the civilizations which European scholarship has canonized as 'classical' but which must themselves be situated in a wider matrix of contemporary economic and political activity.

The developments which differentiate the first millennium from that which preceded it were social, political and technological; yet these elements must not be seen as coincidental features with separate origins, but rather as complementary aspects of an unfolding pattern with its own internal logic. Before considering the chronological sequence of their appearance, it is worth noting the basic elements of the new pattern. In abstract form, these can be summarized as follows:

(1) In place of the bureaucratic and palace-centred diplomatic and trading networks of

World Archaeology *Volume 24 No. 3* *Ancient Trade: New Perspectives*
© Routledge 1993 0043–8243/93/2403/361 $3.00/1

Bronze Age internationalism, mercantile city-states became the building blocks in a new economic framework. Temples, rather than palaces, became the symbols of communal consciousness and economic success; merchant enterprise, rather than state-controlled exchange, became the dominant mode of trading activity.

(2) The production of iron as a useful metal – first of all in Cyprus as early as the twelfth century BC – appears to have been part of the process of progressive commercialization in the east Mediterranean, and developed (like glass) in the competitive search for new added-value products in the later second millennium; but its effects on the nature of trade were to be far-reaching. The spread of iron-working inevitably subverted systems based on the acquisition and circulation of bronze; and since control of this system was fundamental to the character of Bronze Age polities, this alteration was an irrevocable step in preventing the re-emergence of these kinds of centralized economies. It also made control of precious metals even more important. This social aspect of iron-using was at least as important as its growing technological significance.

(3) New forms of political power gradually emerged in response to the erosion of direct control of economic activity. Territorial definition became important both at the level of the boundaries of city states and of larger entities, giving rise to new forms of empires based on direct politico-military control and involving new forms of regional surplus extraction and tribute.

(4) Tensions between land-rooted and commercial interests became more explicit. On a larger scale, this might be manifested in a complementary relationship between territorial empires and mercantile city states on their boundaries – and especially on coasts – through which foreign trade was channelled. This differentiation also occurred, however, within independent states and individual cities, where mercantile activity was often confined or separated from the main arenas of political power.

(5) As in the Bronze Age, overseas trading stations concerned with the acquisition of raw materials were established in less developed areas on the periphery of the urban world and now along the whole length of the Mediterranean, but even here initially independent trading posts ('pre-colonial movements') were often converted into formal colonies by the mother-cities which attempted to introduce elements of overt political presence. Their formal territorial definition allowed some of these colonies to evolve into autonomous polities.

(6) The general concern for political control within well-defined territorial boundaries affected the nature of warfare, both on land and sea. The defence of frontiers required new forms of military organization and technology, whether in the drilled citizen armies of small states or the large standing armies of empires. It was reflected in the increasing differentiation of warships from merchantmen, use of cavalry rather than chariots, and synchronized mass-infantry tactics. These required a growing volume of *matériel*. At sea, the need to counteract pirates preying on a growing volume of maritime traffic was a further incentive to maintain naval power.

(7) The more explicit definition of territorial polities created a new consciousness of ethnic differences, which was sharpened both by the increasing scale of commercial competition and by rival movements of colonization or imperial expansion – in some cases involving the forced movement or exile of populations. The spread of literacy (both within and between societies) helped to define and harden linguistic units and contributed to a self-conscious identification of ethnicity with language.

Downloaded by [Iowa State University] at 05:26 19 October 2014

(8) These developments altered the nature of slavery, which increasingly took the form of chattel slavery alongside the forms of household ('patriarchal') slavery practised earlier. Slaves became a commodity traded in large numbers and were applied to large-scale construction and industrial works, including agricultural work and mining. Slave populations might now be ethnically distinctive, often brought from considerable distances.

(9) The requirements of tribute, commerce and military expenditure (e.g. mercenaries) increased the need for stocks of bullion, which were acquired both by overseas exploration and the intensification of mining enterprises. The economic and strategic importance of supplies of precious metals led to intervention by the state and attempts to authenticate, regulate and control them through the formalization of coinages – standardized, guaranteed units of composition and weight, with the identifiable stamp of the state (cf. Hart 1986). This practice began in areas where silver production took place within the territory of the state (like Lydia and Greece), rather than in areas (like the commercially more advanced Phoenicia) where silver had to be imported. The importance of coins as opposed to the use of precious metal in conventional units of weight probably has as much to do with this latter aspect as with the needs of commerce, and too sharp a line cannot be drawn between 'monetary' and 'pre-monetary' usages.

(10) Although these features appeared only gradually during the early first millennium, and took different forms in different sections of the Mediterranean (though generally earlier in the east), they formed part of a progressive increase in scale which surpassed anything achieved in the Bronze Age. This can be seen not only from the speed of first millennium developments, the size of the units involved, and the appearance of capital cities (with populations in the range 30–100,000). These imply the movement of hitherto unparalleled volumes of material. In geographic terms, the expansion of activity throughout the Mediterranean opened up a new hinterland, especially in southern temperate Europe, which now began to take on the functions of a periphery. This enhanced the importance of Italy as a junction between Mediterranean maritime routes and land routes into Europe, leading ultimately to the emergence of Rome.

As in the second millennium, the process of expansion was by no means the simple progressive extension of a 'developed' economy; rather it had the character of a long-distance intervention, linking existing cycles of exchange along the length of the Mediterranean and initially concerned with a few, high-value products. As each area responded to the opportunities presented to it, however, the local differentiation of economic activity created complementary zones of different types of production to a much greater extent than in earlier times, with the emergence of new centres and supply chains. A complex series of competitive manoeuvres, involving bypass routes and shifting political alliances or imperial conquests, kept the pattern constantly fluid and mobile.

The following sections attempt to summarize the complexities of this process in the first half of the millennium, divided somewhat crudely into centuries, primarily in terms of its economic logic. This description is not intended to exclude other aspects of the process, such as religious and ideological ones, which relate to the wider problem of the contact of cultures. The fact that it is necessary to describe it in this way at all, however, is a result of the compartmentalization of scholarship which has often treated individual parts of the Mediterranean region as if they had developed in isolation (Wolf 1982: 3–19). This account is intended to redress the balance.

The Levantine initiative: tenth and ninth centuries (Fig. 1a)

Although several of the features which were to be characteristic of the first millennium had emerged in the brief period of post-palatial trading activity centred on Cyprus in the twelfth century BC (Sherratt and Sherratt 1991: 373–5), the effective (though not total) collapse of inter-regional trade for part of the eleventh century marks the subsequent revival as a new phase. The speed with which this revival took place, however, indicates its dependence on what had gone before, and especially in the areas associated with maritime trade. Both Egypt and Assyria, while benefitting from the elimination of rivals, were hard hit by the collapse of centralized power, which brief military revivals did not reverse. The area which recovered most rapidly was the southern Levant (Philistia and Phoenicia), linked both to Cyprus and now also to the incense-producing areas of southern Arabia, via the west Arabian coast route. This southern Levantine focus was the core region of expansion at the start of the first millennium.

Its success lay in the combination of external connections with its own agricultural and manufacturing resources. Its manufacturing capacity (apparent already in the twelfth century, when it was closely connected with Cyprus) is evident in Philistia in the industrial production of textiles and olive oil at large installations such as those at Tell Miqne; their products included fine dyed cloth (Tyrian purple and royal blue) and the perfumed oil represented by small pottery and faience flasks. Transport amphorae reappeared at southern towns like Ashkelon and Lachish in the tenth century (Zemer 1977). Inland, the growth of the Kingdom of Israel was closely connected with overland trade on the north–south caravan routes to Arabia, whose importance is indicated in the Biblical account of the visit of the Queen of Sheba (Saba'). The linkage of inland and coastal resources (between Israel and Phoenicia) is indicated by the agreement between Solomon and Hiram King of Tyre (I Kings 6) for cedar-wood to build the temple in exchange for annual supplies of wheat and oil, and Phoenician ports gave access to Mediterranean sources of precious metals for which Solomon and Hiram maintained a joint fleet. Southwards sea traffic in the Red Sea was also potentially important, and an attempt to bypass the west Arabian land route is recorded in the account of the joint maritime expedition which Solomon and Hiram undertook down the Red Sea for the gold of Ophir (I Kings 9; Chronicles 8; Liverani 1987: 72–3).

The principal focus of Tyrian and other Phoenician traders, however, was the Mediterranean, and especially the main highway of east–west maritime traffic from Cyprus along the south Anatolian coast to the Aegean, and to Crete and the central Mediterranean – the artery of trade from the Bronze Age to the Medieval period (cf. Pryor 1988: figs 2 and 27). Cyprus was a key staging point in the westward contacts which it had pioneered in the closing centuries of the Late Bronze Age, and may again in the tenth century have added its own products in characteristic lentoid flasks. From here the links led to Crete, which was a stepping-stone to the west Mediterranean at least as far as Sardinia, where a ninth-century Phoenician inscription includes the word *tarshish*, refinery. The interest in the high value metals of this area (silver, and perhaps tin) represent a revival – or even a continuation – of the long-distance routes of the late second millennium pioneered by Cypriots. Cypro-Phoenician fine bronzework in both Crete and Sardinia demonstrates the sophistication of the exports now reintroduced to these areas.

Downloaded by [Iowa State University] at 05:26 19 October 2014

Trading stations in Sardinia gave access to the indigenous exchange cycles of the coastal west Mediterranean, linking peninsular Italy, north-west Africa, southern Iberia (and thus the tin of the Atlantic route), which could provide a variety of raw materials; activity of this kind could lie behind the high traditional dates for the 'founding' of Cadiz and Utica. Contacts with the proto-urban communities of Villanovan Italy, with their strong central European links, seem mostly to have been indirect and mediated through Sardinia.

Another route led by Rhodes to the Aegean, with a nodal point in the sheltered Straits of Euripos, between Euboea and mainland Greece. Here, below the tidal race of Chalkis, was a natural stopping-point for ships waiting to travel further up the east coast of Greece into the north Aegean, or to make contact with existing networks of exchange; its importance is indicated by the rich tombs at Lefkandi with their gold jewellery, fine cloth, Cypro-Levantine figured bronzework and perfume flasks and Egyptianizing faience trinkets. This community was apparently growing rich on passing traffic in search of high value materials like the silver of nearby Lavrion, acquiring foreign goods and metalworking techniques; and, as in the west Mediterranean, later traditional histories refer to Phoenician activity on Aegean islands such as gold-bearing Thasos.

The ninth century saw an intensification of this pattern, with the construction of artificial harbours at towns on the Levantine littoral like Tabat-el Hamman – a sign that larger cargo ships were once again coming into use. The northern Levant now became more important, as the revival of Assyria revitalized the coastal towns supplying goods from Phoenicia over the Syrian saddle and perhaps attracted Phoenician commercial settlement (Kestemont 1985); this area, too, joined the westwards seaborne trading ventures. Typically north Syrian metalwork appears at Lefkandi, while Euboean pottery cups and Attic kraters found in Cyprus indicate that some manufactured goods were now being brought back in return, in addition to valuable materials from the wider hinterland. By the end of the century Euboean cups could be found along with Cypriot wares in port towns in Cilicia and the Gulf of Iskenderun such as Al Mina. The Aegean may now have supplied other materials as well, such as iron which could have been produced in Euboea in exportable quantities (Bakhuizen 1976), and although direct evidence is lacking it is not improbable that its early production was concentrated in such centres of technical expertise. Greek textiles, too, are hinted at by geometric patterns in the pottery (Barber 1991).

The increasing volume of traffic on the east/west Mediterranean axis led to the growth of strategic points along the route. In Cyprus this intensification is manifested in the politicization of Phoenician links, through the foundation of a formal colony at the port-town of Kition, marked by impressive temples and perhaps associated with the exploitation of the copper mines at Tamassos. Other coastal towns like Amathus also prospered. Cypro-Phoenician flasks appeared in some numbers on Rhodes and Kos and also in Crete, and were soon followed by local versions (for rebottling unguents imported in bulk?), while the Phoenician inscribed bowl and gold jewellery from graves in the Tekke cemetery near Knossos have been held to demonstrate the presence there of eastern specialist craftsmen (Coldstream 1982). By the end of the century the port town of Kommos in southern Crete, with its finds of Levantine bulk-transport amphorae, had acquired a Phoenician shrine (Shaw 1989).

This stage of tenth- and ninth-century contacts – Niemeyer's (1984; Gehrig and Niemeyer 1990) '1. historische Stratum' – was characterized by a marked disparity

Downloaded by [Iowa State University] at 05:26 19 October 2014

between the renascent city-states of the east Mediterranean littoral and their maritime contact zone, even though growing local centres (like those at Lefkandi and Athens) seem to have been stimulated by the long-distance contacts of Levantine traders. Such contact points were typically established on islands, perhaps themselves on the edges of indigenous exchange systems. These mercantile movements belong to a pre-colonial phase of activity, which seems to have been a relatively fluid search for high-value materials with only the beginnings of a more formalized pattern. Piracy and the adventitious capture of cargoes and slaves is likely to have been part of the picture in the early days, as revealed in Homer's portrayal of the Phoenicians encountered by Odysseus. Nevertheless in the eastern half of the Mediterranean this was gradually beginning to give way to some renewed absorption of Near Eastern religious and cultural values, expressed in shrines and temples, the use of unguents in purification rituals and the syncretizing nature of Levantine artistic motifs (Rowlands n.p.): and perhaps also to some regional specialization in production – for instance in iron and copper – which was to be a characteristic of the following phase. However, the formalization of trading contacts through colonies and the growth of larger political units, and the consequent definition of ethnic labels, was largely a feature of the succeeding centuries.

Downloaded by [Iowa State University] at 05:26 19 October 2014

The joint venture: the eighth century (Fig. 1b)

The maritime network established in the first two centuries of the first millennium now grew in importance as the surrounding land areas were increasingly drawn into it: the continuing growth of Assyria drew trade and tribute from the Levantine cities, intensifying their quest for high-value materials further west; the emergence of city-states in the Aegean added new centres of production and demand for raw materials; indigenous foci in Villanovan Italy and southern Spain developed under strong external contacts (Frankenstein 1979). Long-distance traders now began to penetrate closer to the sources of their supplies, rather than simply contacting the edges of indigenous exchange cycles. The 'developed' area within which advanced manufacturing activities (textiles, perfumes) took place now extended as far as the Aegean, which could export its own manufactured products westwards; and both Aegeans and Levantines participated in trading missions and colonial foundations in the central Mediterranean, with Phoenicians leading the way further west. The complexity of the pattern increased as new players joined the game.

The growing importance of the Assyrian Empire led to the formation of secondary states on its immediate periphery: as well as the older competitor of Urartu and the Aramaean kingdoms of north Syria, the appearance of spectacular 'royal' burials at Gordion in Phrygia and Salamis in Cyprus (Rupp 1987) indicate the emergence of new polities whose dynastic rulers asserted their political presence with ostentatious items of Assyrian and Levantine elite culture: chariots, bronze and ivory thrones, and Urartian or north Syrian metal drinking equipment. From the later part of the century onwards, individual items from as far afield as the Caucasus, west Persia ('Luristan') and Babylon might now be found in the tombs and sanctuaries of the eastern Mediterranean.

This infilling of the political map of the east Mediterranean is symptomatic of the increasing density of east/west trade, which it must be emphasized was a *north*

Mediterranean phenomenon: the north African coastal route westward from Egypt to Tunisia, sometimes attributed to the Phoenicians (e.g. Schauer 1983: Abb. 2), is anachronistic for this period and was not regularly used before the later seventh century. Westward maritime traffic followed the south Anatolian coast from Cyprus to Rhodes, and then could either cycle anti-clockwise around the Aegean or continue westwards in two streams: either along the southern margin, through Crete and up the west coast of Greece to cross to southern Italy and Sicily, or through the Cyclades to Euboea and Attica. Here an alternative westward route was possible for small ships using the isthmus of Corinth to avoid the dangerous circuit of Cape Malea in the southern Peloponnese. The Cretan route was supplied by Phoenician installations such as Kommos; the latter route depended on a measure of co-operation with the native Greek communities. It may be that these routes were operated by merchants from different Levantine cities: the links between Euboea and northern Syria suggest the possibility that a chain of trading-partnerships had already been established, perhaps paralleled by a more metropolitan Phoenician involvement (via Kition, amongst others) on the south Aegean route (Winter 1979; cf. Boardman 1990: fig. 2). These complementary (though necessarily overlapping) spheres of activity were equally significant further west.

The Aegean must have seen a considerable density of traffic, in which both indigenous and eastern seamen participated without apparent rivalry. Indeed it is precisely in these circumstances that the transmission of aspects of oriental culture (ideas of ritual purification, mythology and its accompanying iconography, the use of alphabetic writing: Sourvinou-Inwood 1981; Morris 1992) took place, and were adapted to the needs of emerging political ideologies. The core area of Greek territorial state formation was the eastward-looking region of Euboea and the Saronic Gulf with its important trans-isthmian link (Chalcis, Eretria, Athens, Corinth, Argos); but equally striking are the 'international' sanctuaries at nodal points on the maritime routes (Lindos, Samos, Delos, Delphi, Pherai, Perachora, Olympia, amongst others: Kilian-Dirlmeier 1985). These combined the functions of establishments for the needs of sailors and travellers (some even including temple prostitutes) with foci of regional and supra-regional identity. The intimate relationship between religion and trade, noted already in connection with purely Phoenician installations like Kition and Kommos, here takes on a new dimension as part of a process of acculturation, by which Greeks first absorbed and then transformed these oriental elements into part of a growing pan-Hellenic consciousness – in which the religious centres of Delos, Delphi and Olympia played an especially important part.

The westward routes converged along the west coast of Greece to skirt the Ionian sea and avoid the long crossing to Italy; if Phoenician boats were larger, as seems probable, they may have been able to strike a more direct route towards Sicily than smaller craft suitable for hauling across the Corinthian isthmus – a practice well known in the history of long-distance trade (and used by the Varangian Vikings to move between Russian rivers on the route to the Black Sea). The Phoenician centres in the west Mediterranean clustered in the triangle formed by western Sicily, southern Sardinia and the Gulf of Tunis, their node at Utica/Carthage. Some of these had now acquired the status of formal colonies, but their interest was in trade rather than in the acquisition of territory. They provided access to the growing indigenous trading network – itself stimulated by earlier Phoenician intervention – which joined the Atlantic Late Bronze Age contacts through

southern Spain and the Balearics to northern Sardinia and the Tyrrhenian cycle (Ruíz Gálvez Priego 1986; Harrison 1988). Atlantic tin and the copper of the Rio Tinto sources fuelled this expansion (Rothenberg and Blanco-Freijeiro 1981). Phoenician trading posts (but not yet colonies) were established on the Andalusian coast itself, at Toscanos, Chorreras and Morro de Mezquitilla (Niemeyer 1984), and ironworking begins in the area at this time. An equally important element of new technology would have been cupellation for the extraction of silver.

Staging posts for Phoenician, Greek and north Syrian trade with Italy have not yet been recognized, though scattered imports, geographical logic and the siting of later Greek colonies would suggest their existence in Calabria (e.g. Francavilla Marittima) or eastern Sicily. The character of their activity within the Tyrrhenian area, however, has been illuminated by the settlement and cemeteries at Pithecusae on the island of Ischia in the bay of Naples (Buchner 1982; Ridgway 1971). These show a polyethnic trading community including north-west Syrians, Euboeans and elements of the native population. Imported objects include Levantine amphorae and unguent-flasks, numerous seals of steatite and

faience, together with Levantine Red Slip bowls and Greek (mostly Corinthian and Euboean) painted cups. Locally made wares include some with Aramaic inscriptions; the bronze dress ornaments are of local (Villanovan) types. Bellows-nozzles and slag testify to the local working of iron, possibly obtained from the rich sources on Elba in northern Etruria, and (as in Euboea itself at an earlier period) the introduction of this technology was an integral part of early trading activity. A scatter of imported pottery and seals occurs in tombs within Campania, Latium and Etruria; and the role of this typical offshore trading community was primarily to make contact with indigenous exchange systems. The position of this trading-station in Campania, far south of the focus of indigenous prosperity in Etruria (with its plentiful bronzework and close links both to central Europe and Sardinia), suggests that such activity was still being kept at a distance by powerful local interests. By the end of the century, dynastic rich tombs in southern Etruria testify to the growth of political power there, while the infrastructure of Aegean and eastern contacts had been strengthened by the foundation of Euboean settlements on good harbours in north-east Sicily and on the coast opposite Ischia at Cumae (just as Euboeans were also expanding in the Aegean, to the northern peninsula of Chalcidice). Soon other communities joined the western trail, infilling and leapfrogging along the route: Corinthians, Rhodians, Megarians and Cretans, with Achaeans perhaps exploring overland routes across Calabria; some of the Sicilian sites, with a temple and agora, can now be described as formal colonies (Boardman 1980).

The eighth century thus saw imperial expansion in the Levant, and economic expansion leading to state formation in the Aegean. Both Levantines and Aegeans tapped the resources of the central Mediterranean, using the advantages of capital concentration and technological expertise in long-distance sailing vessels to make contact with local trading systems, where the sail was probably not widely in use. The introduction to this area of new technologies of metal extraction and manufacture (especially silver and iron), together with supplies of novel mass-produced and bulk products (faience and glass, textiles, oil and wine) and the ideologies which they symbolized, gave traders access to supplies of rare materials such as silver or tin in demand for consumption in the more sophisticated economies of the east. This overseas trading activity retained some of its earlier informal character, with competition probably taking the form of rival trading partnerships rather than the conscious exclusion of whole ethnic groups. Nevertheless, a broad division is evident between metropolitan Phoenician (principally Tyrian) and other groupings, and the extension of political control through the foundation of formal colonies indicates a growing differentiation of interests and exclusive definition of routes. The constraints of geography now began to give particular opportunities to communities on constriction points, of which the Gulf of Corinth was to be particularly important.

The great bifurcation: the seventh century (Fig. 1c)

As the Assyrian Empire reached its height, the process of orientalization and the genesis of new states moved westward, to Italy and Spain: but in each case not simply to the south-eastern coasts where Phoenician and Greek contacts were strongest but to the indigenous centres of power which had independent links to a European hinterland. As

the frontier of urbanization moved west, so a new perhiphery began to be created and ironworking took hold in central Europe, with radical effects on societies still organized around the circulation of bronze. The demands of the Assyrian Empire for tribute from the Levantine cities continued to intensify their western enterprise, while struggles for territorial definition among the network of Greek city-states ensured a growing demand for bronze and iron.

In the maritime traffic which these core areas generated, a new element of competition now emerged. Distribution maps of eighth-century oriental bronzework such as Cypro-Phoenician bowls (Markoe 1985), candelabra with *blattüberfall* ornament (Matthäus 1992: fig. 10), or lyre-player seals show a continuous swath from the Levant to Italy, on the routes discussed above (and often in Aegean sanctuaries); seventh-century Phoenician bronze jugs, or bowls in the later orientalizing style (now more often of silver or gold), show an extended distribution in the west, separated from east Mediterranean finds by a large, Greece-shaped hole (Markoe 1985; Matthäus 1992: figs 11, 14). These patterns suggest that local production now replaced many previously exotic goods, and that Phoenicians were now perhaps being effectively excluded from trade routes across the Aegean, with territorially based ethnic consciousness taking a harder edge.

The seventh century also saw a growing integration of maritime and inland areas, and especially an articulation between Anatolia and the eastern Aegean seaboard reflected in the growth of Ionia and Lydia with their links along the Maeander and Hermus – the latter with a rich electrum source on its tributary the Pactolus. The Greek communities on the eastern side of the Aegean, in Ionia and Rhodes, expanded their role in the production of oriental types of metalwork, perfumes and textiles – and also in painted pottery, which was both a commodity in its own right as drinking sets (ornamented with figured textile patterns!) and a decorative container for organic products. Links with north Syria were not lost, and Ionian pottery was exported there in quantity to the exclusion of Cypriot wares. Equally important was the westwards trade, both to mainland Greece and – funnelled through the isthmus of Corinth – to consumers in Italy. The volume of traffic on this major

artery from the east Aegean provided an opportunity for the addition of value-added manufactures: either the relatively bulky products represented by amphorae with painted SOS decoration, or the labour-intensive perfumed oils and containers made in Corinth, which now rose to special prominence as a result of its unique position in this network of trading contacts. Corinth is likely to have developed metalworking and textile production, though it is pottery which is the most visible archaeological evidence of its industrial production and trade – especially the decorated alabastra and aryballoi used as perfume containers but also the less intensively studied amphorae (Salmon 1984). This area led the process of capital formation and advanced technological production on the mainland, following the lead of the eastern Aegean.

The Phoenician sphere in the western Mediterranean developed greater diversity, both through bulk production of commodities such as dyestuffs and fish preserves at coastal factories in Iberia and through the growth of the native state of Tartessos in the lower Guadalquivir valley (Harrison 1988). A similar process of growth occurred around Carthage, which became the advanced manufacturing node of an area which now developed an increasing economic autonomy. In Italy, states developed around the major cities in the core area of southern Etruria, and their indigenous shipping plied the Tyrrhenian routes both to exploit their own hinterland in Sardinia and Liguria and to interface with Phoenician and Greek colonial traffic. Northwards, their periphery was constituted by the Po valley and Slovenia, by which European high-value materials such as amber reached Etruria and the Mediterranean. A further area of penetration, this time by Greeks alone, was the Black Sea – a natural extension of the interest in the gold and silver sources of the northern Aegean, and perhaps with a phase of pre-colonial activity before the formal settlements by East Greeks on the metal-rich northern shore of Anatolia, with their links to the interior. This area was to become important in the next century, with the rise of the Iranian world and the further development of overland routes.

Intensification and outflanking: the sixth century (Fig. 1d)

The pattern of the following century can be briefly sketched. As in earlier periods, the increasing scale of the Near Eastern economy was a powerful motor of growth throughout the contemporary world-system: the temporary dominance of Babylon and the rapid growth of the Median and Persian Empires brought a new scale of integration from the east Aegean to the Indus. Specialization in production at this time is graphically illustrated by Ezekiel's (Ezekiel 27: 12–23) description of the commerce of Tyre, 'merchant of the people for many isles', with its zonation of agricultural and animal products from a large Levantine hinterland (grain, oil, honey, resin, wine, wool, sheep, goats, horses, mules), bronzework and slaves from Anatolia and the Aegean, metals from the far west and exotica from the Red Sea (Liverani 1988: fig. 129). The new centres in the central and west Mediterranean were by this time producing and exporting their own commodities in bulk: Etruscan amphorae occur from Sicily to the Golfe du Lion (Cristofani 1986: pl. 11). In this century, too, an extensive central European hinterland appeared in the Hallstatt D period. The Aegean area passed an important threshold, in which cities were no longer agriculturally self-sustaining and had to be supported by imports of grain – paid for, in

part, by exports of silver. The larger vessels needed for such a scale of transport altered the nature of the maritime network.

The growing differentiation of the east Mediterranean economy as a whole required an increase in liquidity to balance the complexity of inter-regional exchanges; silver, now available in quantity, became not just an important high-value consumable but also a commodity in regulating flows of produce and accounting payments of tribute. Flows of bullion and the use of weighed units had been a feature of the expansion of urban economies from the beginning, and inscribed castings in unitary weights are known from the eighth century in north Syria (Balmuth 1971). Punched units of locally produced electrum (and soon afterwards gold and silver separately) were struck at Sardis in Lydia in the early sixth century, and comparable issues soon appeared on both sides of the Aegean in silver-producing areas; coins were also struck in Sicily, southern Italy and Cyrenaica by the end of the century. East Greeks, with access to north Aegean silver sources, could tap the breadbasket of Egypt, where the trading community at Naucratis (occupied from the late seventh century) could acquire surplus grain for cities with limited agricultural resources of their own. Further supplies could be obtained from agricultural colonies established in Cyrenaica and from comparable settlements now established on the Black Sea coasts. Athens, with the advantage of an indigenous source of silver (Lavrion/ Thorikos), could make use of the Sicilian colonies, which increasingly specialized in grain production.

The large vessels suitable for grain transport could no longer pass across the Corinthian isthmus and the westward passage now perforce used the route round Cape Malea. The effect of this new pattern of bulk transport is reflected in the striking shift in pottery exported to Italy in the mid-sixth century, from Corinthian and East Greek wares to Attic (Martelli 1985; Cristofani 1986: fig. 13), as economies of scale (rather than aesthetic criteria!) favoured these complementary manufactured cargoes. A further and equally significant twist to this topic is given by Herodotus' account of the Phocaean intervention in the west Mediterranean, which he says involved the use of warships (pentekonters) to penetrate around established interests and reach the Adriatic, Tyrrhenia, Iberia and Tartessos directly (Herodotus I: 163; Shefton 1982). Now, where necessary, overcoming opposition in naval battles, this movement outflanked Etruscan Italy by reaching the main outlets of central European trade directly, at the head of the Adriatic (Spina) and the mouth of the Rhone (Massalia), as well as contacting the Atlantic world in the far west. The chain of long-distance contacts ran continuously from the borders of Media to the Celts (Kimmig 1983; Nash 1985).

Conclusion: patterns of development

In 1000 BC most of the Mediterranean was effectively prehistoric; by 500 BC it formed a series of well differentiated zones within a world-system. The transformation did not take place by the passive diffusion of 'civilization', but by active intervention and response. Local maritime exchange cycles and routes of long-distance trade were already in existence, and the centres of future growth were already evident; but what articulated them into a single interacting system was the input of capital from the east. Large sailing

Downloaded by [Iowa State University] at 05:26 19 October 2014

vessels, and the economic organization which made them possible, drew together the fortunes of communities throughout the Mediterranean.

This maritime expertise and capital concentration came initially from Phoenicia, and Phoenician vessels were probably the largest ships plying Mediterranean routes until the later seventh century. Phoenicia was also characterized by other features of advanced urban economies: the use of silver as a medium of exchange, slavery and the labour-intensive manufacture of textiles and perfumes. The Phoenician trading diaspora created contacts with societies at very different levels of social and economic organization; temples and sanctuaries formed important meeting points between the different economic systems of Phoenician and indigenous groups. In the Aegean, close trading-partnerships along the main artery of contact with north Syria led to the adoption and cultural transformation of this pattern; in north-west Africa and Iberia, a colonial culture was established. Two areas of indigenous culture resisted this process and participated on their own terms: Etruria and Tartessos. Both were important termini of routes into the European hinterland, in central Europe and the Atlantic respectively. The Aegean area, too, established trading and colonial links with the west and increasingly in competition with the Levant; from the sixth century onwards it became increasingly concerned with grain supplies, using local sources of silver and a new pattern of colonial interests to support urban growth.

The geographical pattern which emerged was a primary zone of capital- and labour-intensive manufacturing, from the Levant to the southern Aegean, surrounded first by a zone of higher value agricultural products (oil, wine – especially in the north Aegean, e.g. Chios, Thasos) and then by a grain-growing belt in Cyrenaica, Sicily/ southern Italy and the Black Sea. Beyond this, separate centres of manufacturing, with their own supply zones, came into existence in Etruria and Tunisia, again with a complex pattern of competition as the more heavily capitalized areas of the east Mediterranean tried to outflank their control of the rich hinterland of temperate Europe.

Neither diffusion nor autonomy can adequately describe the nature of this process of growth; rather, the pattern of development can best be described as co-evolution within the extending limits and zonation of a growing world-system.

Abstract

Sherratt, Susan and Sherratt, Andrew

The growth of the Mediterranean economy in the early first millennium BC

This article surveys the development of Iron Age trading systems in the Mediterranean. It contrasts the social organization of first millennium trade with that of the preceding Bronze Age, but also points to continuities in the patterns of expansion. Using archaeological and historical evidence, it outlines the growing scale of production and extension of the area where advanced technologies were employed. The routes of maritime trade are related both to factors of competition and to the size of shipping.

The Role of Harbour Towns in the Re-Urbanization of the Levant in the Middle Bronze Age (1800-1600 BC). Perspectives from Eastern Cilicia and the Amuq Plain of Hatay

Murat Akar

(PhD candidate, Università degli Studi di Firenze
email: muratakr@gmail.com)

This paper focuses on route networks and their impact on the development of Middle Bronze Age urbanization in the Levant, concentrating particularly on Cilicia and the Amuq Plain around the Gulf of Iskender in the southeastern corner of Turkey. It looks at socioeconomic developments in coastal and inland settlements that seem to have evolved progressively in such a way as to suggest that their distinctive relationships may have played an important part in the re-urbanization of the Levant in the Middle Bronze Age. This is a phenomenon that manifests itself in the revival of political and economic structures, and in the archaeological evidence for large-scale public buildings and fortification systems as indicators of complex and organized Middle Bronze Age settlements (Akkermans and Schwartz 2003, 223; Dever 1987, 28; Klengel 1992; Matthiae 1997, 379) (FIG. 1).

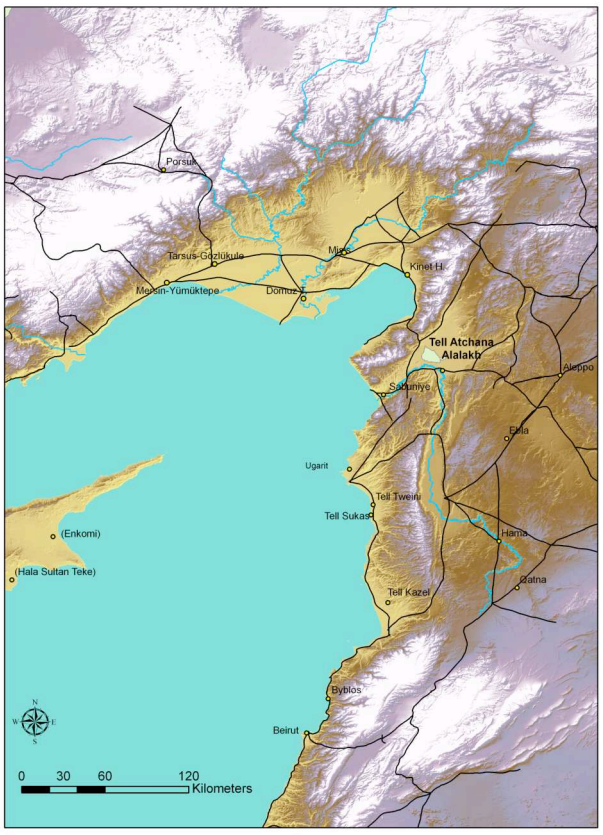

FIG. 1: SRTM map of the Northern Levant with major trade routes digitized from *Barrington Atlas of the Roman World*. Courtesy of Murat Akar & Ekin Demirci.

Throughout this paper, I will explore the often-neglected role of harbour towns in the development of re-urbanized cities in the interior. The model presented here stresses external relationships at different micro- and macro-regional scales, dependent on the successful exploitation of routes for economic and social purposes, which in turn led to the formation of connected, semi-dependent kingdoms. I shall limit myself to the Middle Bronze Age, which is a formative period for the connections between Late Bronze Age polities in the 16th-14th centuries BC, in which the overall nature of the economy can

be seen as a product of collective collaboration between symbiotic micro-zones, characterized by sociopolitical and economic interaction, flows of resources and ideas, and creation of identities. This, I would emphasize, is the final outcome, but its origins must be sought in the social complexity of the Middle Bronze Age.

Re-urbanization is characteristic of almost all Middle Bronze Age sites in the Levant. The factors that provoked the collapse of the Early Bronze Age centres, followed by the revival in the Middle Bronze Age of economically strong city-states, are still debated (Schwartz and Nichols 2006). The collapse is evident in depopulation and abandonment levels at the end of the Early Bronze Age, particularly at major centres in western and inland Syria, as well as in eastern Cilicia (Akkermans and Schwartz 2003, 223).

The regeneration of Middle Bronze Age societies is indicated by large fortified cities and palace complexes in the Middle Bronze II levels of various sites (Kempinski 1992a; Burke 2004). These large-scale constructions undoubtedly indicate highly stratified societies with administrative systems, which required the successful use of resources to support their urban economies (Dever 1987, 152). In this respect, regeneration following disruption and collapse can be seen as part of a regular cycle of social evolution, often discernible in the archaeological evidence. The traces of these cycles can be seen in alternations between contexts rich in luxury materials and characterized by standardized production systems, and strata which lack central organization and are typified by small-scale units of production (Faust 2005). The reasons behind this sort of cycle were varied (Yoffee 1979), reflecting political and economic processes which, particularly in the case of Cilicia and the Amuq, were sensitive to ebbs and flows in external relationships.

The Mediterranean, with an area of 2.5 million square kilometres, is the largest inland sea in the world. As such, it is impossible to regard it as having any sort of homogenous cultural identity, despite the fact that the sea itself expedited the development of close connections that eventually developed into a dynamic set of interlinked systems.

> "The sea is also the foundation of our case for the distinctiveness of Mediterranean history: deeply implicated in the unpredictability of conditions of life, it is also of course the principal agent of connectivity." (Horden and Purcell 2000, 133)

In this respect, it is impossible to formulate any sort of progressive stadial pattern of social development that characterizes the development of regional and interregional interaction. Cultural and geographical boundaries were defined or transcended at various times by systems

of maritime and overland networks, which had resulting effects on the rise and fall of political entities and their exploitation of associated territories. In this sea-dominated landscape, Mediterranean economies and their political structures were based on continuity of supplies. The system was never exclusively orientated around production and economic self-sufficiency (Falconer 1994, 122); but instead the circulation and trade of goods and materials on different scales is the key to understanding this Mediterranean economy (Hayden 1994, 198). Exchange systems between and within the micro-regions of the Mediterranean (Horden and Purcell 2000, 123) played an important role in transforming communities in certain places into dynamic and complex economic centres, which at the same time were dependent on the existence of one another.

To start with, the main attributes of an urban centre need to be addressed from the point of view of the economic implications of the development of complex sites. As far as archaeologists are concerned, the commonly accepted criteria for the distinction of urban settlements are mostly physical: the size and estimated population, combined with the excavated evidence - despite the fact that in no region has anyone yet drawn up satisfactory criteria for establishing a threshold (Trigger 1972, 577; Grove 1972, 559). A second attribute, site function, depends on the existence of social institutions distinguishable in material and textual sources, and dealing especially with intra-site social and economic activities. The role of commercial contacts in the formation of urban centres in the Middle Bronze Age, on the other hand, does not yet appear to have been fully explained. Various models have suggested that the increased populations and sizes of urban centres depended upon the agricultural surpluses of their hinterlands, thus emphasizing the centrality of rural-urban relationships to urban survival, but no one has really placed much emphasis on the functional and symbolic roles of exchange systems. As for migration models (Kenyon 1962, 76), these can hardly be regarded as providing answers in themselves to questions concerning the formation of new political powers and identities, in the absence of any consideration of their economic underpinnings.

> "Trade implies an organization, a special administration, which regulates human activities both in terms of procurement and social relations. The degree of organization and its evolution may be understood in the light of these exchanges." (Renfrew 1975, 4)

Large quantities of non-local supplies were introduced into their economic and exchange systems to satisfy the material and symbolic requirements of these interactive communities.

We can briefly list some obvious examples. The rise in large-scale construction projects is directly related to the importation of timber supplies, especially when it comes to the extensive use of long wooden planks in the roofing and framing of mudbrick architecture (FIGS. 2-3). This heavy demand for timber in the more treeless regions of the east would have made cities dependent on the acquisition of these raw materials and would have led to the formation of specialized ports, Spezialhafen. These owed their existence to the handling of such special supplies from their hinterlands (Rühl 1920; Treumann 1997). The dependence on essential metal resources provides another example. These two particularly desired raw materials - timber and metal - were shipped by harbour towns on the Levantine coast, lying between Cilicia and the Amuq Plain in the Hatay, with their access to the rich sources of the mountain ranges of the Amanus and Taurus. Such interactions are well documented in the Egyptian records of the Early and Middle Kingdom, for instance in the case of Byblos (Jidejian 1968, 25). However, it was not only Egypt that witnessed such large-scale projects. Palace and temple complexes in inland Syria, with their massive courts, also testify to the importance of the trade in raw materials.

With regard to the more specifically symbolic and political value of trade, the exchange of luxury goods and materials had special significance for conspicuous consumption among the elite, and acted as an important stimulus to the development of commercial contacts and the exploration of routes (Sherratt and Sherratt 1991). Even though much Bronze Age trade was conducted at palatial level, this in itself can also be seen as being responsible for a rise in individual enterprise, as well as for creating inducements to what would appear to be a 'black market' economy. The appearance of local variations in imported items in residential sectors might well be seen as a result of the acquisition of products not subject to egalitarian distribution. Archival sources from Middle Bronze Age Kültepe indicate the penalties for

trading forbidden materials, such as iron (*amūtu* and *aši'u*) (Larsen 1976). Such laws were, in all probability, introduced to prevent transactions that were already taking place, thus highlighting inequalities resulting from attempts to maintain the exclusivity of certain goods. Inequality, in fact, can be seen as an indirect motivator, a key incentive for the development of alternative strategies to secure supplies to satisfy demands.

In other words, trade was fundamentally linked to the development of social institutions which were oriented around the exclusivist aspirations of the elite classes, but at the same time it was also significant in the rise of individual enterprise, with consequent effects on society as a whole.

Located in close proximity to one another, the urban centres of the Levant were dependent on continuity of supplies through their economic and cultural connections. The rise in the number of harbour towns along the Levantine coast at the beginning of the Middle Bronze Age must have resulted from, or been related to, the meeting of regional and interregional demands (Marcus 2002, 250; Raban 1988, 185). Both the palatial and private sectors were party to this, at a time when technological advances in sailing and shipbuilding would have been exploited in a highly competitive environment. In these circumstances, one can hope that further deep-water research, combined with luck, will eventually lead to the discovery of a well-preserved Middle Bronze Age shipwreck (Bass 1976; Margariti 1998),[1] which can contribute to our understanding of maritime trade in this period (FIG. 4) (Cohen 2002).

FIG. 4: Uluburun II, Replica of the Uluburun LBA shipwreck. http://www.360derece.info/. Photo by Murat Akar.

[1] The Şeytan Deresi shipwreck, found in Gökova Bay near Bodrum, is dated to the late Middle Bronze Age based on ceramics collected from the wreck.

The urban expansion of city-states in the Middle Bronze Age has frequently been linked with the arrival of new ethnic groups.[2] Somehow, the economic reasons behind these political changes in the Levantine context were neglected, and the arrival of new 'peoples' was seen as a sufficient explanation in itself for the brilliance of the new discoveries associated with this period. The question of ethnicities in this part of the world, of course, plugs into modern political sensitivities. Although from a long historical perspective the eastern Mediterranean has always been a highly interactive and cosmopolitan region, we have tended to interpret this outcome of the routes along which economic and cultural values passed, and were constantly defined and redefined, in terms of our modern preoccupations and preconceptions.

A particularly well-known phenomenon of this Middle Bronze Age period - which must have a bearing, directly or indirectly, on maritime activity in the northern Levant - is the foundation of one of the oldest textually documented trading centres at Kültepe, ancient Kanesh, where a colony of Assyrian merchants was active. Yet the implications of this for contemporary Mediterranean trade are rarely explored.

There is ample evidence that Kültepe had commercial relations with towns in northwest Syria, such as Ebla, whose interest in Anatolian copper is documented in the texts.[3] This connection may have been direct or indirect, depending on the choice of routes and intermediate transshipment points. From the written sources, we also know that tin and silver were exchanged along with copper, and the existence of sources of these in the Taurus Mountains would have given an important advantage to Cilician towns situated near the interfaces of coastal and inland routes in this commercial network (Yener 2007, 153, figs. 9-10). This reached its height in the late Middle Bronze Age, when the rise of major powers began to result in the appropriation of such micro-regional trade to the benefit of their own larger economic systems.

The excavations of the Kestel mine and the small Early Bronze Age miners' village at Göltepe in the Taurus Mountains in the 1980s initiated a lively debate concerning Bronze Age tin sources; and the claims of Kestel, versus Afghanistan, to have supplied tin in these early periods is still an ongoing issue (Yener 1989; Muhly 1993). Advances in scientific analysis,

[2] For a discussion of migration models, see Tubb 1998.

[3] The tablet Ktn/K 794 (published in Bilgiç 1992) is a letter sent from Ebla to Kanesh. It indicates that Ebla and Kanesh maintained good economic relations. Cf. also Kienast 1960, no. 342, 17: "Copper is available. Many Eblaites have come here, a huge amount of copper is weighed out for them in the palace...", which clearly indicates travelling Eblaites acquiring raw materials in Anatolia. See also Yener 2007, 153.

however, are now beginning to provide more information on this subject. The analysis of some tin ingots from the Late Bronze Age Uluburun shipwreck points to the source of the tin being in the Taurus Mountains (Pulak 2000). In addition, isotopic analyses of crucibles from the recent excavations in the workshop district of Tell Atchana/Alalakh again indicate a source within the Taurus range, thus emphasizing the importance of connections between the plain of Amuq and Cilicia (Yener 2007).[4] Strikingly, specimens of silver ore from Middle Bronze Age Kültepe and Assur fit into the Taurus range, thus pointing to the exploitation of Taurus metal resources in the Middle as well as Late Bronze Age, and their active role in providing metals for long-distance exchange (Yener 2007). The evidence of distinctive Amuq-Cilician ware (Özgüç 1955, 460, fig. 29) and Cypriot White Painted Pendent Line juglets (Åström 1989, 16, fig. 1, pl. 3:1, from Kültepe IB) in Kültepe contexts reinforces this. Whether it is a question of bulk or luxury commodities, Cilicia and the Amuq Plain seem to have played an important part in this Middle Bronze Age network.

Finds from Late Bronze Age contexts at Palestinian, Syrian, Cypriot, Egyptian, Aegean and Anatolian sites demonstrate a wide range of intensive mercantile interactions, which are visible mainly in pottery but can also be seen in the technologies, weaponry and ornaments that formed the aesthetic fashions of the era. Going back to the Middle Bronze Age, this material evidence, though still evident, is proportionately smaller in quantity. Various factors can account for this. There are still very few excavated Middle Bronze Age sites, and most of the major harbour towns have substantial overlying Late Bronze Age strata, leaving Middle Bronze Age occupational levels still in need of investigation. The recent excavations at sites like Tell el-Dab'a (ancient Avaris) in the Nile delta, Tell Kabri in northern Galilee, Arqa in northern Lebanon, and many others do, however, provide valuable evidence for the international outlook of late Middle Bronze Age levels. The substantial amount of Cypriot White Painted Ware from the southern Levantine coast testifies to regular connections with Cyprus (Maguire 1995, 54), while fragments of Aegean Kamares pottery have also been found at a number of sites along the Levantine coast (Merrillees 2003), indicating that exchange was already taking place on an international scale (Akar 2006). The appearance of late Middle

[4] A crucible found in the eastern part of the tell in the Late Bronze I workshop district was analysed by Seppi Lehner.

Bronze Age wall paintings at Avaris (Bietak et al. 2007) and Tell Kabri (Niemeier and Niemeier 1991) are clear examples of the products of this cultural interaction.

The large body of data acquired from the Southern Levantine coast is growing steadily with new excavations in Syria, the Amuq valley and Cilicia. Recent interest in coastal and trading settlements has provided crucial information for understanding this lively period and the commercial connections that seem to have played a major role in the appearance of the northern Levantine urban centres.

Starting with Cilicia, which is nothing if not seaward-facing, the role of this interface zone has long been associated with commercial centres like Tarsus at the western end of the plain, while the role of the eastern Cilician settlements around the Iskenderun Gulf has rarely been investigated or has simply been ignored.

After 18 years of archaeological investigation under the direction of Marie-Henriette Gates as part of a Bilkent University project, the site of Kinet Höyük on the shores of the Iskenderun Gulf is now providing extremely valuable information about the character and function of the site and region during the Middle Bronze Age. Due to the accumulation of later levels, the Middle Bronze Age remains were excavated only in the eastern terrace of the site. A burnt Middle Bronze Age stratum was excavated directly beneath mediaeval and Hellenistic levels, and its entire assemblage uncovered *in situ* (FIG. 5) (Gates 2000a; see also Gates 1998; 1999a; 2000b; 2002; 2004; 2005).

The exposure of the storage sections of an administrative complex, which is oriented north-south, indicates the mercantile role of the site. This complex was reinforced by a stone tower at its northern extremity; and, through several soundings excavated at 10 m intervals from the outer wall of the complex, we have now confirmed that the building itself was located on the eastern slope of the Middle Bronze Age citadel, and functioned as part of the city's fortification system (Akar 2006).

In the Middle Bronze Age, the palaces of the Levant as well as of Anatolia were embedded in the fortification systems and located in close proximity to the city gates. As embodiments of power, their location was visually strategic, as being the first large-scale monuments one would encounter on entering the city (Ussishkin 1986, 485). They also seem to have a direct relationship with the control of goods going in and out of the city.

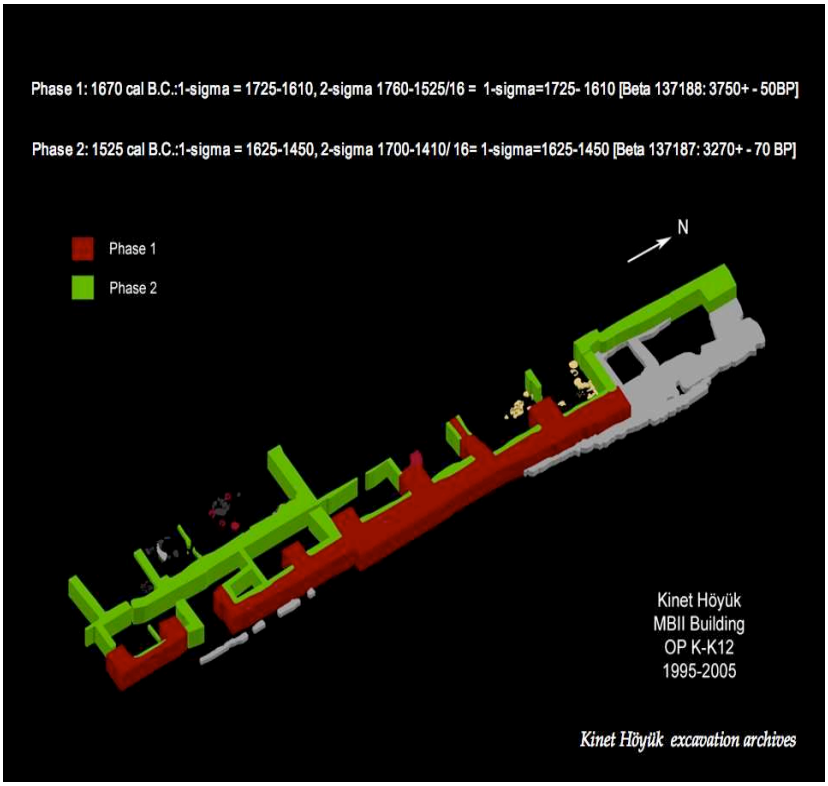

FIG. 5: Kinet Höyük MBII building. Modelled by Akar & Kocabryik.

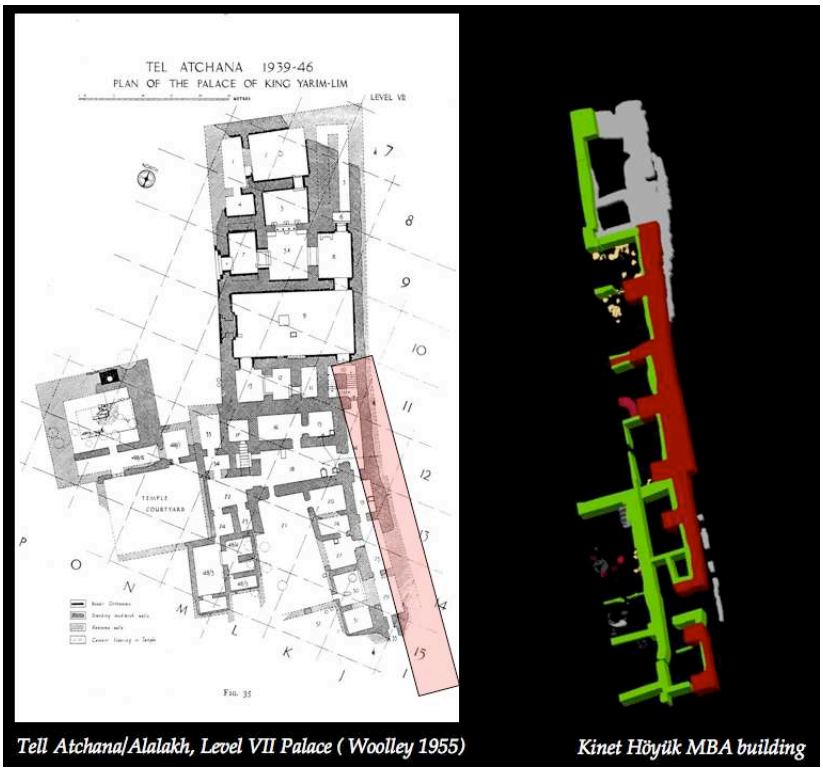

FIG. 6: Kinet Höyük MBA building and Alalakh Level VII Palace.

This layout is strikingly comparable to those of the well-known palatial complexes at Middle Bronze Age Levantine sites such as Ebla (Matthiae 1997), Alalakh (Woolley 1955) and many others (FIG. 6). To judge by its architectural design and its use of space, the extent of the Kinet building, which is over 50 m in length, exceeds that of some of these well-known palace complexes. Its symbolic significance is evident in its monumentality, and its commercial role in the large-scale storage facilities divided into separate narrow units.

Geographically speaking, the Amanus Mountains create a natural boundary between the Anatolian and Syrian cultural zones, with Kinet, according to its location, lying in the Anatolian zone. This cultural division is still evident today, when one can clearly observe the differences between the two sides of this mountain range. However, based on the variety of pottery and other objects recovered from the building, it is possible to suggest that Levantine fashions were adopted in the Middle Bronze Age culture of Kinet Höyük.[5] Most of the ceramic assemblage is of local production. However, to take the most common types, the ovoid storage jars, for instance, share elements of style with examples from Tell Mardikh/Ebla IIIA-B and Alalakh level X (Gates 2000a, 84), in much the same way as the architecture does. Even the Cilician Painted, otherwise known as Amuq-Cilician or Syro-Cilician ware, shares similarities with Levantine or Habur wares (Bagh 2003). The close similarities between these regional wares clearly indicate the amount of interaction, even though this is reflected through regional variations. Looking at other objects, the existence at Kinet of a duckbill axe mould (Gates 2005, 172, fig. 10)[6] and an example of a Syrian style mother-goddess figurine (Gates 2000a, 98-9, pl. 7, fig. 8) may show that interaction between the Syrian and Anatolian zones was not limited only to trade and exchange, but that foreign cultural elements were also integrated into the existing culture of this small harbour town in eastern Cilicia. Pottery and other artefacts can often be misleading in encouraging conclusions of this sort, since these are essentially portable. However, with the architectural evidence we are on a firmer footing in contextualizing this process of acculturation (Gates 1999b).

According to Arab geographers, mediaeval Kinet Höyük (Hisn-al Tinat, on the southeast corner of the Cilician littoral) was used for the shipment of timber from the Amanus

[5] See Stager 2001, 629, where he defines the role of harbours in socioeconomic terms as places where cultural and ethnic diversity can be minimized: "The effectiveness of the port power accrued from the capability of the economic systems to penetrate diverse ethnic, cultural and political boundaries and to interconnect them with a minimal use of force."

[6] For the distribution of this axe type, see Philip 1989

Mountains for export to Egypt, southern Syria and Tarsus (Gates 1999b). There is no reason to suppose that the site's strategic importance during the Middle Bronze Age was much different, when the expanding Levantine settlements required large amounts of timber for their large-scale construction projects. The Braudelian approach stresses the importance of harbour towns along the Mediterranean coast as transit points along a coastal highway to provide supplies to inland interiors (Braudel 1993[1966], ch. 5). This also explains the small number of imported materials in comparison with local resources at Kinet, since the primary reason for its existence was not trade as such, but the business of shipping goods (Gates 1999b, 309). Expanding cities were demanding raw materials, and this is why ancient builders tried to develop means to establish harbours even in the most inaccessible places, in order to ensure a continuous supply of merchandise (Raban 1988, 185). The increase in harbour towns in the southern Levant in Middle Bronze IIA-B adds weight to this statement, and above all stresses the importance of maritime traffic (Marcus 2002, 250; Broshi and Gophna 1986, 88; Gophna 1984, 24). This pattern of development is particularly clear in the northern Levant and coastal Cilicia, where the geographical boundary – the Amanus Mountains – restricted access between the Syrian plain and Cilicia. The mountain passes are difficult to cross and open to possible attacks, and this made sea trade more practical and less dangerous. In this context, Kinet's architectural evidence (in the form of the administrative building) and its functional attribution (a harbour town) give satisfactory criteria for defining the urban nature of the settlement. Even a small site such as Kinet in the 'marginal' zone of eastern Cilicia can and does demonstrate the urban patterns of Middle Bronze II in the eastern Mediterranean. And I think it owes its urbanization to commercial and predominantly external interactions.

The Cilician Survey carried out by Seton Williams in the 1950s provided a glimpse of the nature of settlement in the region (Seton Williams 1954). More refined surveys in the separate zones of Cilicia are now providing more scientific and accurate information about the settlement distribution patterns.[7] Although the available data are still problematic, some observations can be made from the accompanying maps (FIGS. 7-8). As part of a Master's thesis in the Department of Settlement Archaeology at the Middle East Technical University, Ekin Demirci has studied the changes in settlement pattern from the Middle to Late Bronze

[7] The improvements in computer-based applications provide a better understanding of the settlement patterns within micro-regions of Cilicia. For a new analysis of the Göksu valley, see Newhard et al. 2008.

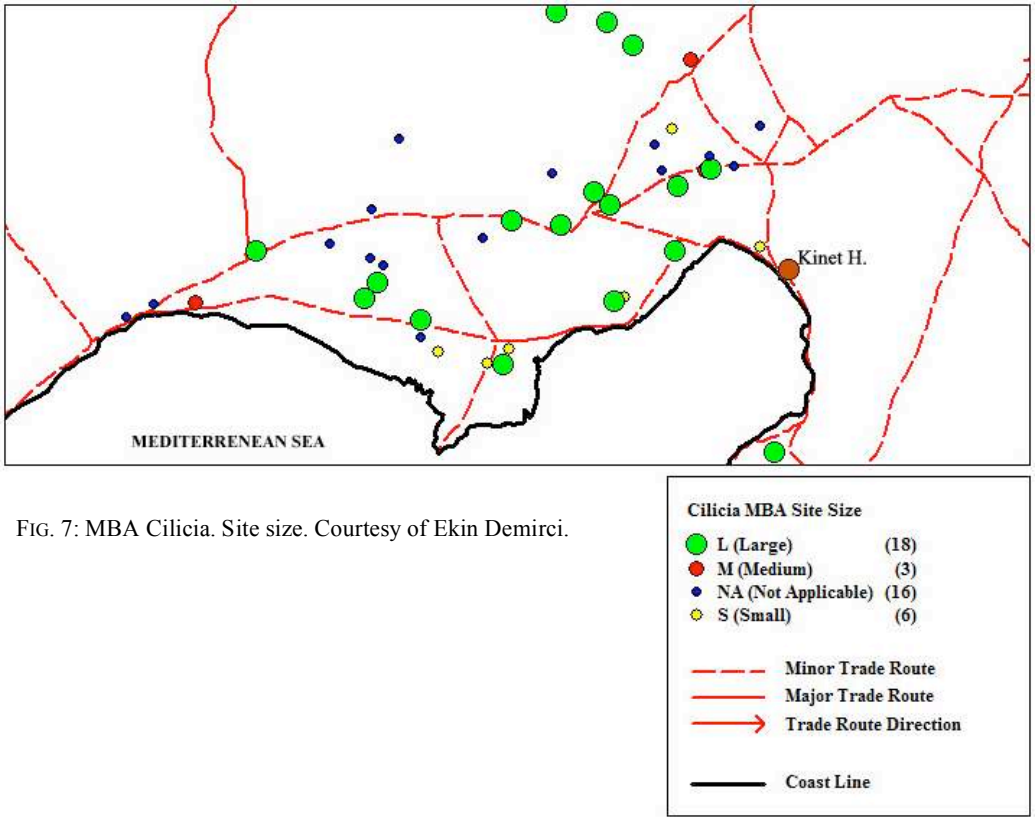

FIG. 7: MBA Cilicia. Site size. Courtesy of Ekin Demirci.

Ages in Cilicia (Demirci 2009).[8] Based on the results of this work several observations can be made:

1. There was clear continuity throughout the Bronze Age in Cilicia. The majority of the settlements were concentrated around the trade routes. There were no major changes in the passage from Early Bronze Age to Middle Bronze Age. The Late Bronze Age centres again followed the main trade route axis, but the settlements increased in number to almost double (from 43 to 80). This settlement pattern seems to underline the mercantile nature of Cilicia throughout the Bronze Age, with roadways following the coastline and passing through the mountain ranges, connecting it with central Anatolia and Syria.

2. Unfortunately, the alluvial accumulations of the Seyhan and Ceyhan rivers in the low Çukurova (Cilician plain) have buried a majority of the coastal settlements.[9] The significant change in the coastline is visible in the maps (FIGS. 7-8). This points up the necessity of geoarchaeological work in order to clarify the problems of geomorphological changes in this area. With sufficient evidence, as Aviva Taffet (2001, 133) has suggested, the Cilician coastal settlements may well be understood through predictive modelling, using the coastal southern Levant settlement distribution patterns as a model. A majority of the river estuaries will have provided likely locations for ports, linking the sea with inland centres (Blue 1997, 41).

Turning to the Amuq, the settlement patterns and distribution maps presented here (FIGS. 9-10) have been created from the Amuq Valley Regional Survey Database, and illustrate a completely different type of organizational system. This difference partly arises from the history of data collection. The pioneering work of Robert Braidwood (1937) has been further advanced by the new Amuq Valley Regional Project team under the directorship of K. Aslıhan Yener (2005). Geoarchaeological research carried out by Tony Wilkinson (Yener et al. 2000) has defined the tremendous impact the environment has had on settlement pattern changes in the valley.

[8] I am grateful to Ekin Demirci for sharing her database and GIS analyses with me. Her detailed study will be published elsewhere. In these thematic maps, the settlement locations and streams were digitized and embedded into 90m SRTM raster images (Shuttle Radar Topography Mission: http://edcsns17.cr.usgs.gov/EarthExplorer/). The Barrington Atlas of the Roman World (Talbert (ed.) 2000) was used to locate the ancient trade routes and the coastline.

[9] Geoarchaeological research carried out at such sites as Kinet Höyük (Beach 2006) and Tell Tweini (Al Maqdissi et al. 2007) indicates high aggradation levels along the Cilician and northern Levantine coasts during and after the Bronze Age.

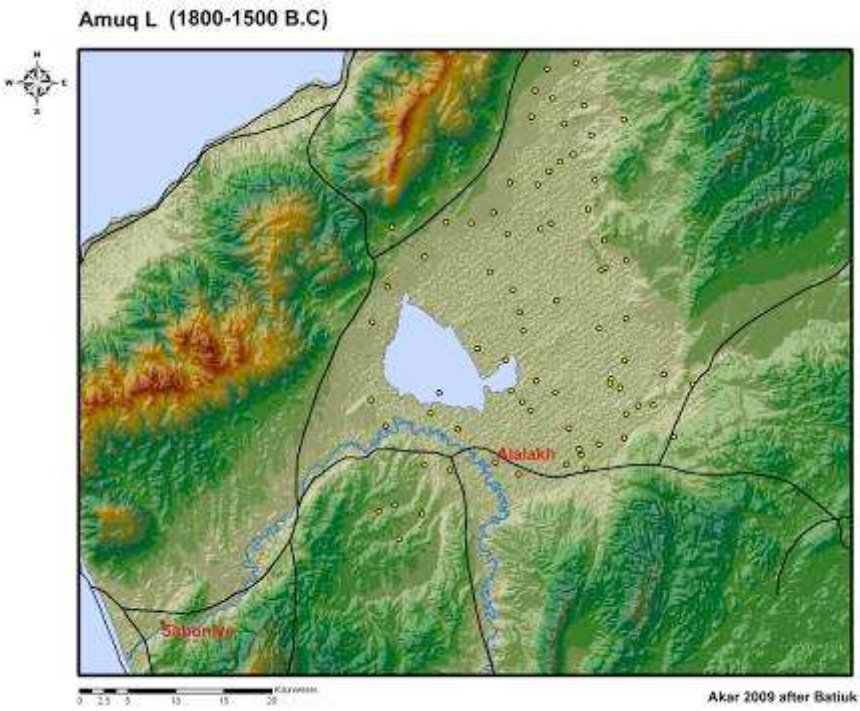

FIG. 9: Amuq L sites. SRTM map with coastline and routes digitized from the *Barrington Atlas of the Roman World*. Image processed by Akar after Batiuk and Casana. Courtesy of Amuq Valley Regional Projects.

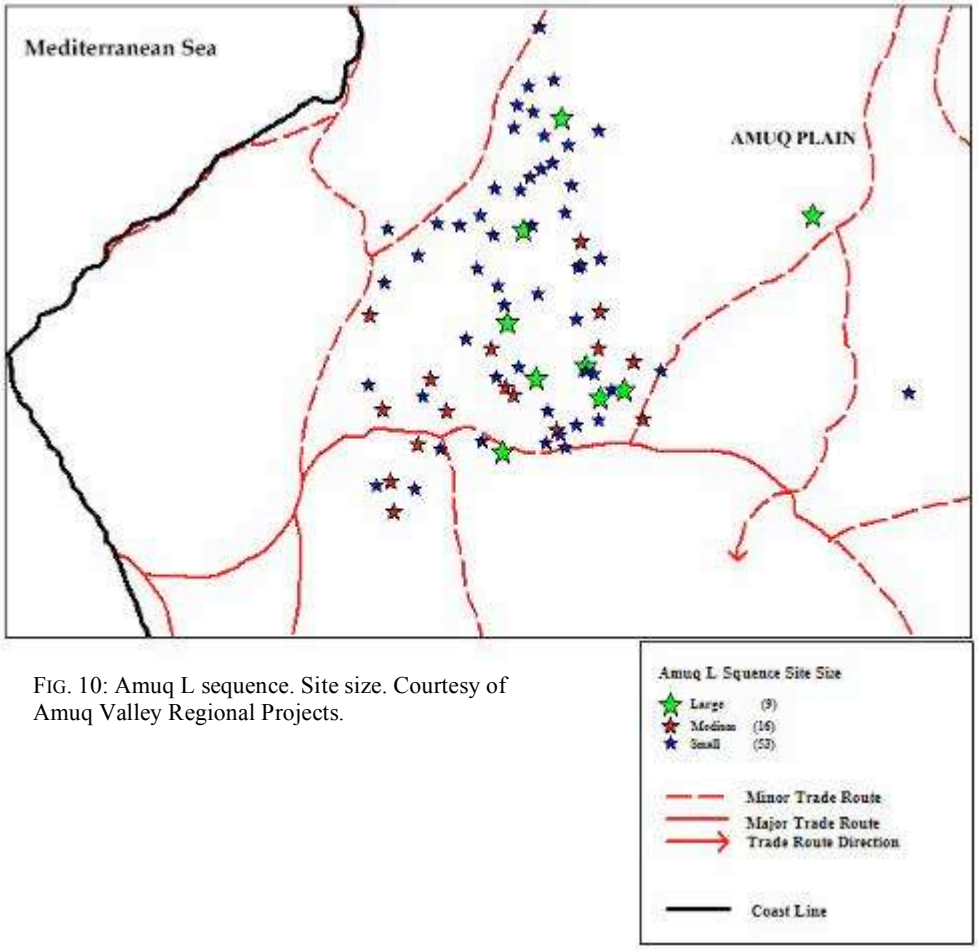

FIG. 10: Amuq L sequence. Site size. Courtesy of Amuq Valley Regional Projects.

The second reason for its difference lies in the Amuq Valley's organization for the purposes of controlling the hinterland, with the valley itself playing a key role as an intermediate trading zone connecting northwest Syria and central Anatolia. Its cosmopolitan and commercial outlook was reinforced by its connection to the sea via the Orontes delta. Today, driving along the main road from Antakya to Reyhanlı, one can see several mounds in quick succession. The density of occupation owes its existence to rapid changes in the riverbed of the Orontes. These geomorphological transformations were responded to by changes in settlement locations.[10] During the Middle and Late Bronze Ages, the valley was under the control of the Mukish kingdom with a territorial organization focused around a number of small agricultural centres nested within a central system (Magness-Gardiner 1994, 37; Zaccagnini 1997, 341). Alalakh,[11] as the capital city of the kingdom, was located at a very advantageous position with access to major land routes from Syria and Anatolia. Its connection with the coastal site of Sabuniye[12] at the mouth of the Orontes gave it the character of an inland harbour (FIGS. 9-10).

Already evident from the excavations of Sir Leonard Woolley are the Minoan style wall paintings of the Middle Bronze Age Level VII palace (Woolley 1955), and a cylinder seal impression with a scene of bull leaping (Collon 1994, 81), which indicate the cosmopolitan status of this town. Recent excavations, going down further into Middle Bronze Age contexts, are now providing more evidence about these systems of interaction. The appearance of Cypriot White Painted V vessels in the eastern part of the tell, separate from the palace area, provides evidence for very late Middle Bronze Age connections.[13] Similar material is now turning up at the contemporary settlement of Tell Tweini in the coastal Jebleh plain in Syria, where the commercial role of this harbour town is emphasized by very similar characteristics. Although the Middle Bronze Age levels at Tell Tweini have so far been excavated only on a

[10] The collection and analysis of data from the area has been developed progressively by members of the Amuq Valley Regional Survey team: particularly Jesse Casana and Steve Batiuk. I am grateful to Steve Batiuk for his endless help with the GIS processing of the data. A detailed analysis of the settlement pattern changes in the valley was presented as a PhD dissertation by Jesse Casana at the University of Chicago (Casana 2003). Further refined analysis of the survey pottery on the basis of that from the recent excavations at Tell Atchana, Tell Tayinat and Sabuniye will contribute to our greater understanding of the Amuq sequence.

[11] The Alalakh excavations are directed by K.Aslıhan Yener as part of a Koç and Mustafa Kemal University Project.: www.alalakh.org

[12] Excavations at Sabuniye have recently been initiated by Hatice Pamir as part of a Mustafa Kemal University project.

[13] The analyis of these and the Cypriot pottery as a whole from the new excavations at Alalakh will be published by Ekin Kozal, Çanakkale University.

limited scale, the fortification system surrounding the city reveals its role as a major regional centre (Bretschneider et al. 2004, 226).[14]

More excavation and survey in the coastal plains of the northern Levant and Cilicia will expand our knowledge of Middle Bronze Age commercial interactions. Current evidence already indicates the international nature of this period and its impact on the formation of Middle Bronze Age urban centres. This is visible in the intra-site patterns, including the monumental architecture and the variety of imported products. On a regional scale, it is visible in the accumulation of centres in proximity to major commercial routes. The Middle Bronze Age of Anatolia and the Levant seems to have witnessed the extensive exploitation of resources which flowed through connected sea and land routes. This kind of interdependency and the importance of commercial exchange should also be seen as the major reason behind the expansion of the Late Bronze Age empires, in which the control of routes and nodal centres was pivotal to imperial policies.

I would like to conclude with an aerial photo of Kinet Höyük (FIG. 11). The industrial establishment around the site - an oil and gas shipment terminal - displays a kind of continuity in the role of the region since the Middle Bronze Age. When this photo was taken, the Iraq war had just begun, affecting the economy of the district dramatically. The parking areas, which used to be filled with hundreds of trucks, were virtually empty, the oil tankers had disappeared from the docks, and the whole place was buried in silence. The disruption to the oil shipment business had had an impact on the local economy, and many bazaars, restaurants, barbers' shops, and other small traders (not to mention the oil and drug smugglers) who served the needs of the truck drivers had packed up and disappeared. Less than a year of crisis had wrought a drastic change.

FIG. 11: Aerial Photo of Kinet Höyük. Courtesy of Marie-Henriette Gates.

[14] The excavations carried out on the eastern flank of the tell, in Field C, have exposed a massive fortification wall, 100 m in length and preserved to a height of 5 metres. Although the date of the wall is not yet clear, the excavators have suggested that it was constructed in the Middle Bronze Age and continued in use during the Late Bronze Age.

II.—WHY WERE THE JEWS BANISHED FROM ITALY IN 19 A. D.?

Historians have been aware that Tiberius, probably at the instance of Sejanus, had the Roman Senate banish the Jews and take other severe measures against them; but nobody has explained the action. It appears indeed to be regarded as a matter destined to remain a mystery for want of sufficient information.

The data are in fact scanty; a careful study of them may however extract the explanation which every student of history must desire. The affair is mentioned by a number of ancient writers, but practically we are dependent on the reports of Josephus and Tacitus.

We begin naturally with Josephus, whose account is more detailed. After relating the sad events which befell in Judea during the governorship of Pilate, he says (Ant. 18. 3. 4): "About the same time another dread calamity threw the Jews into confusion, and certain transactions not devoid of disgrace befell in the sanctuary of Isis at Rome. After I shall have recorded the bold attempt of the devotees of Isis, I will direct my story to what occurred among the Jews." He then recounts the outrage committed by one Decius Mundus, a Roman knight, upon Paulina, a Roman lady of high rank and exemplary character, who was the wife of Saturninus, a man of like rank and character. This Decius, consumed with a guilty passion for Paulina, had sought without success to seduce her by bribes to satisfy his desires. Failing in this he had resolved to terminate his life by starvation, but was dissuaded from his purpose by one of his freedwomen, who promised to procure for him the object of his passion. The terms agreed upon, the procuress, knowing that Paulina was a devotee of the Egyptian cult, conspired against her honor with certain priests of Isis, who reported to the great lady that they had had a revelation from the god Anubis bidding her come to the sanctuary to dine with him and enjoy his embraces. The devout Paulina, overjoyed at this signal proof of the divine favor, after obtaining the consent of her husband, repaired to the shrine, where she spent the night

in the arms of the supposed god. Taunted subsequently by Mundus with having granted him in the guise of Anubis what she had previously refused, she disclosed the horrid imposture to her husband, and he in turn reported it to Tiberius. The Emperor, after due inquiry, ordered the temple of Isis demolished, the cult-statue of the goddess cast into the Tiber, the priests and the procuress crucified, and the guilty knight banished.

This narrative concluded, Josephus resumes, "Such were the insolent deeds of the priests in the temple of Isis. Now I return to relate what befell the Jews at Rome at this time, as my account promised before." Thereupon he recounts the tale as follows. A worthless Jew, a fugitive from justice in Judea, conspiring with three equally worthless accomplices and giving out that he expounded the wisdom of the law of Moses, persuaded one Fulvia, a Roman lady of quality who was a proselyte to Judaism, to contribute purple and gold for the temple at Jerusalem; but the men diverted her gifts to their own uses. Tiberius, informed of the matter by Fulvia's husband, who likewise bore the name of Saturninus, ordered all the Jews banished from Rome; and the consuls drafted four thousand of the men and sent them to Sardinia, inflicting severe punishment on a large number who refused to serve in the army lest they be compelled in the service to violate the Jewish law. Thus the Jews were banished from Rome because of the wickedness of four men.

On reading the account of the Jewish historian one gains the impression of a great calamity visited upon a people for a trifling offense. If one doubts the sufficiency of his explanation, —and modern historians have of course doubted it,—one may perhaps conclude that the real cause of these severe measures was the deep-seated animosity against the Jews fostered by their reputation for exclusiveness and their assumption of superior righteousness: a parallel on a vast scale to the ostracism of Aristides. Nevertheless one instinctively questions whether Tiberius, who by Josephus's own account instituted an inquiry before taking the measures of state consequent on the affair of Paulina, could have acted in the case of the Jews without reasons which seemed to him good and sufficient, even if urged to drastic action by Sejanus and others who may have been swayed by prejudice. We shall presently see that the very narrative of Josephus suggests something more than appears upon its face.

We seek in vain for further light on the affair from other Jewish sources. Philo does indeed refer to the matter without giving any information. *In Flaccum,* c. 1, he merely mentions Sejanus as one who has persecuted the Jews: unfortunately the portion of this work which dealt with him has been lost—possibly destroyed of set purpose. In his *Legatio ad Gaium,* cc. 23-24, he does not specify the charges brought against the Jews, but lays stress on the circumstance that but few were implicated in the affair, thus confirming, though in terms less precise, the statement of Josephus that there were only four offenders.

Of Roman writers Suetonius also (*Tiberius,* cc. 35-36) yields nothing of importance because of the vagueness of his statement, which is moreover to all appearances based on the account of Tacitus. In fact Josephus alone mentions the charge against the Jews. Nevertheless it is not unimportant to consider the narrative of Tacitus. We have observed how closely Josephus links the cases of Paulina and Fulvia, though the connection between them indicated by the Jewish historian is merely that of coincidence in time and the parallel is apparently drawn with a view to contrast the insolent outrage of the Egyptians with the venial offense of the Jews.

The Roman historian, too, links the Egyptians and the Jews together in this matter, but quite contrary to what Josephus suggests clearly imputes the greater blame to the latter. Moreover he obviously considers the question as one of unholy rites, which he must have regarded as essentially the same, since he identifies them outright. Indeed, Tacitus not only connects the case of the Jews with that of the Egyptians so intimately as to suggest their practical identity, but he also brings both into the closest relation to the measures adopted by the Roman senate to restrain the licentiousness of women. "The same year," he says (*Annals,* 2. 85), "the licentiousness of women was curbed by severe decrees of the senate, and measures were taken to prevent the venal prostitution of any woman whose grandfather, father, or husband was a Roman knight; for Vistilia, the daughter of a praetor, had made public profession of prostitution before the aediles pursuant to an ancient custom which regarded the confession of shame a sufficient penalty for the unchaste. Her husband Titidius Labeo was brought to question, why in view of his wife's manifest guilt he had failed to enforce the

All use subject to https://about.jstor.org/terms

legal penalty. As he excused himself by pointing out that the term of sixty days allowed for the institution of legal proceedings had not yet elapsed, it was held to suffice if Vistilia were dealt with: she was accordingly banished to the isle of Seriphos. The question also of expelling the Egyptian and Jewish cults was laid before the senate; and it was decreed that four thousand freedmen tainted with that superstition, who were of the proper age, should be deported to Sardinia in order to put down brigandage there, with the thought that if they perished because of the severity of the climate it were small loss; the remainder should depart from Italy unless before a given date they renounced their unholy rites."

Since the total number of four thousand men drafted into the army. according to Tacitus, is precisely that mentioned by Josephus as the Jewish contingent, this passage makes it clear that the measures of the senate were directed chiefly—almost exclusively—against the Jews. The Egyptians here cut an unimportant figure. The action is brought into relation with the steps taken to curb the licentiousness of women, but is clearly distinguished from those concerned with venal prostitution, and connected with religious rites which the historian denounces as unholy. So far as Tacitus may have had in mind the story of Paulina, which we get from Josephus, it is clear that she was not guilty of venal prostitution; which agrees with his distinction. Her case was one of prostitution, indeed, but of a different sort, connected with unholy rites. In the eyes of Tacitus, and presumably in the eyes of the Roman authorities, the Jewish rites were identical with the Egyptian. Moreover, the account of Josephus makes it clear that the cases of Paulina and Fulvia in so far resembled that of Vistilia as they also were Roman ladies of equestrian or senatorial families, whose licentiousness the various measures were intended to curb.

Vistilia was guilty of venal prostitution. Paulina was guilty, however excusably, of religious prostitution. Regarding Fulvia we are left in doubt, because Tacitus, while treating the Egyptians and Jews as practically identical, does not specify the charges in either case, and Josephus, while linking them closely together, represents the offense of his co-religionists as extremely venial. Nevertheless the presumption is obviously very strong

All use subject to https://about.jstor.org/terms

that in the eyes of the Romans the affair of Fulvia was not unlike that of Paulina. Have we, then, no means of determining the charges preferred against the Jews and accepted as established by the Roman authorities?

We have seen that Josephus represents the offense of the Jews as consisting in the misappropriation by certain Jewish impostors of gifts solicited from Fulvia with the understanding that they were to be sent to the temple at Jerusalem. It may possibly occur to someone that in accordance with the decrees of Augustus (Josephus, Ant., 16. 6. 2-5) such conduct might be interpreted as sacrilege. This explanation would, however, be certainly at fault, because the decrees in question had in view the possible seizure of Jewish contributions by Greeks, individuals or states, and provided that the guilty should be delivered over to the Jews for punishment. To the Roman mind, we may add, such sacrilege—even granting that it would have been so accounted—practiced by a Jewish outlaw against the 'unholy sanctities' of the Jewish 'superstition' could scarcely have sufficed to justify the authorities in taking measures so drastic and embittered.

Now Josephus says that the contribution of Fulvia consisted of gold and purple for the temple at Jerusalem: to what use they were to be put, he does not say. Every student of Hebrew antiquities, however, must recognize at once that the gold and purple were intended for the hangings of the temple. This fact, as we shall see, when duly considered, affords the necessary clew; for if one examines the history of these hangings and notes their inevitable suggestions to the minds of Asiatic and European peoples of antiquity, the interpretation put upon the solicitation of such gifts is not difficult to comprehend.

The Priestly code represents the hangings of the temple as derived from those of the 'tent of meeting' constructed by direction of Jehovah for the housing of the ark of the covenant during the journeyings of Israel in the wilderness. Modern scholars are agreed, however, that the 'tent of meeting' is in fact nothing but a fictitious replica of the temple supposedly adapted to the nomadic life of the desert, though its construction is such that it could not have been used as the story represents. Nevertheless, before there was a temple proper there was in fact

This content downloaded from 50.50.118.183 on Sat, 20 Jul 2024 05:14:45 UTC
All use subject to https://about.jstor.org/terms

a 'tent of meeting,' probably not unlike the sukkah [1] of the festivals that furnished the concrete basis out of which Hebrew legend reconstructed the mythical account of the Exodus. It might be shown, if one chose to avail oneself of the requisite space, that the tent of the hag was in earlier times the tent of *rendez-vous* or of assignation, in which the people at their festivals met by appointment the divinity or his representatives. Such tents of assignation are still in use in the pilgrimages of Islam at Mecca, and are known to have been constructed and afterwards burned on the 'tent-day' of the triduan festival of Isis at Tithorea in Phocis. The context of Pausanias, to whom we owe our information (10. 32. 14-18), suggests that the same was true of the rites of Isis held at Coptus in Egypt. The tent of meeting or assignation was often connected with the shrine of the god, most commonly on its roof, whence hierodules received the name 'prostitutes on the roof.' Whether at Rome, in the case of Paulina, the meeting occurred in the upper chamber or in some other, we do not learn from Josephus. Even now a sukkah may be attached to a synagogue, though its primitive use is doubtless forgotten. However, the union of Paulina with Anubis in the chamber of the temple of Isis was unquestionably regarded by her as a rite of initiation of a certain degree. In fact, as I hope to show on another occasion, initiation was in ancient times always in form either a nuptial or a prenuptial rite, in which the divinity might be represented by a human substitute. Hence there cannot have been anything irregular about the case of Paulina except the intrusion of an unauthorized representative of the god in the person of Mundus, who procured the privilege by bribery. So much for the 'tents' or hangings of the temple.

As may be shown by numerous instances from various lands, the weaving of these tents or hangings fell to the female hierodules, who were sometimes entrusted to the safe-keeping of male hierodules or eunuchs. It will suffice here to cite an example from the Old Testament, which shows that the practice was not

[1] The 'tent (אֹהֶל) of meeting' did not differ essentially from the sukkah, as is shown by Hosea 12, 9. The 'tent' was conceived as an upper chamber resting upon the house of Jehovah (Exodus 26, 7); cp. the temple of Bel, Herod. 1. 181.

unknown in Israel. Among the reforms of King Josiah it is recorded (ii. Kings 23, 7) that "he brake down the houses (tents) of the sodomites, that were in the house of Jehovah, where the women wove hangings (tents) for the Asherah." These 'women' were unquestionably hierodules or temple prostitutes, entrusted to the safe-keeping of eunuchs.[2]

It will be urged by way of objection that whatever might have been true of ancient Israel, so long as the influence of the cults of the Baalim made itself felt, such conduct as is here supposed to have been imputed to the Jews in the case of Fulvia was unthinkable in Judaism at the beginning of the Christian era. Had not the reforms of King Josiah, and the Deuteronomic and Priestly codes intervened and effectively purged the temple at Jerusalem? It is not necessary for our argument to prove that the ancient practices actually were continued: it would equally well suffice if it were merely shown that they were familiar enough from other Semitic cults to lead the Roman authorities to interpret the advances of the Jews to Fulvia as solicitation to become a temple prostitute. But it is in fact a questionable assumption that the abuses against which the Prophets inveighed and the Law provided penalties were ever wholly done away before the destruction of the second temple; for even if the efforts at reform had succeeded, there were many circumstances that tended of necessity to re-introduce practices not consonant with the loftier ideals of the Jewish people. It may be questioned whether orthodox Judaism ever for long dominated the population of Palestine. Judaism was a church among many dissenters, not a few of whom were reckoned as its members. Since the enforced conversion of the Idumaeans in the time of John Hyrcanus there must have been large numbers of professed Jews who continued the ancient heathen practices within or without the temple at Jerusalem. Truly there were many called Jews who were not the chosen people of Jehovah.

[2] For the existence of hierodules in Israel see Stade, Bibl. Theologie des Alt. Testaments I, pp. 133 sq. He omits, however, the significant passage (Num. 31, 40) about the thirty-two virgins who fell to Jehovah from the spoil of the Midianites. They cannot have been regarded otherwise than as hierodules. The passage is, however, recognized as a very late addition to P. Hence the fact that hierodules in the service of Jehovah are here taken as a matter of course is perhaps the strongest evidence of the persistence of the institution in Judaism.

These are general considerations deserving of being duly weighed; but it is not necessary to rest the case here, as there is specific evidence of the greatest value. The non-canonical Christian gospels of the nativity supply testimony which cannot well be impugned on the ground of bad faith or prejudice. A quotation from the *Protevangelium of James* (cc. 10-11) will suffice to show that the practice of pre-exilic times was not thought to be impossible in the time of Augustus. "And there was held a council of the priests," we read, "saying, Let us make a veil for the temple of the Lord. And the priest said, Call me undefiled virgins of the tribe of David; and the servitors departed and sought, and they found seven virgins. And the priest bethought him of the child Mary, that she was of the tribe of David and undefiled unto the Lord, and the servitors went and brought her. And they led the virgins into the temple of the Lord and the priest said, Determine me by lot who shall weave the gold, and the white, and the byssus, and the silk, and the blue, and the scarlet, and the true purple. And the true purple and the scarlet fell to the lot of Mary, and she took it and went to her house.[3] And at that time Zacharias was dumb, and Samuel served in his stead until Zacharias spake. And Mary took the scarlet and span it. And she took her pitcher and went out to fill it with water;[4] and lo, a voice, saying, Hail, thou that hast found favor, the Lord is with thee: blessed art thou among women. And she looked round to right and left, wondering whence the voice came. And she went away trembling to her house, and rested the pitcher, and seated herself on her chair, taking the purple, and drew it out. And lo, an angel of the Lord stood before her

[3] The word is *oĭkos*, but it may well mean tent: cf. the בָּתִּים of the sodomites, ii. Kings 23, 7, the same word as is used for the 'hangings' of the Asherah. Gen. 27, 15 it means a tent (LXX. *oĭkos*). Pseudo-Matthew represents Mary and her five virgin companions as lodging in the 'house' of Joseph, whom the non-canonical gospels represent as a priest, chosen for this service by a device modelled on the procedure in the case of Aaron.

[4] Myth and legend know no insignificant details; whatever they relate is included because it has a meaning, though we may not be able in every instance to determine it. It is probable that the water was to serve for the bridal bath. Mary was to be the bride both of God and of Joseph.

saying, Fear not, Mary: for thou hast found favor before the Lord of All; and thou shalt conceive according to His word."

Can any one question that this account represents Mary as a hierodule, the bride of the Lord of All, meeting Him or His angel in her 'house' in the temple at Jerusalem? Observe that it was while she was there engaged in spinning the true purple for the veil of the temple that there was brought to her by a messenger of the Lord the beatific annunciation of the divine favor which was to make her indeed the virgin bride of the Lord of All and the mother of the Saviour. Whether or not such a thing actually occurred from time to time in the temple at Jerusalem, we need not pause at present to inquire. It requires no proof that devout Christians of Syria, many of whom must have been converted Jews, during the second century of the Christian era not only conceived it as possible, but founded their faith in part on the belief that in the case of Mary it was a literal fact.

One readily sees that the story of Paulina, as related by Josephus, and that of Fulvia, as we are thus enabled to reconstruct it, are quite as closely parallel as our analysis of the historical data would lead us to expect. The connection of Fulvia with the purple[5] destined for the temple at Jerusalem suggests the character of the hopes which may well have been held out to her by the Jewish impostors. At all events there was abundant justification for the interpretation of their conduct if Tiberius regarded it as solicitation to turn temple prostitute.

If we take this view of the affair of Fulvia we have an adequate explanation of the data. The measures of the Roman authorities and the practical identification of the Egyptian and Jewish rites in the account of Tacitus become intelligible. There remains the cause for the persecution of the Jews alleged by Josephus. On the view here suggested the statement of the Jewish historian is indeed inadequate, as every thoughtful reader must have found it; but it gives at least a part of the truth. If Josephus did not tell the whole story, it may be that he was

[5] Pseudo-Matthew, c. 9, enlarges on the significance of the purple. Because it falls to Mary her companions tauntingly call her the queen of the virgins; but an angel appears and declares that the purple is a prophecy, not a subject for taunting. The prophecy is fulfilled by the angel of the annunciation.

unwilling to relate details which must inevitably compromise his people; but it may be, also, that he honestly held that the sole offense actually proved against his guilty co-religionists was that of misappropriating the contributions solicited from Fulvia for the behoof of the temple. Be that as it may, the Roman authorities, interpreting and weighing the evidence, might with good reason have felt justified in regarding the cases of Paulina and Fulvia as at least in intention parallel, and might deem the Jews more obnoxious than the Egyptians because of their well known zeal in proselytizing the women of Rome.

W. A. HEIDEL.

Helena Augusta, the Cross and the Jews Questions about the mother of Constantine the Great

By JOSEPH VOGT Tübingen*

For Dr. Karl Groß, the HH Old Abbot of Ettal, in memory of the Würzburg studies

There is no lack of literary information about Helena, nor of pictorial representations.
the Empress Mother1. But it is striking that we do not receive sufficient information about her origin, family and homeland. Even the authors who have written her wonderful
The panegyrical glorification of her work in the last years of her life leaves the question of her parentage unanswered, such as Eusebius, vita Constantini 3, 41-47 (ed. F. Winkelmann) and Ambrosius, de obitu Theodosii 41-49 (CSEL 73, 369 M.). She was an innkeeper when the successful Roman emperor Flavius Constantius took her in, probably in one of the Balkan provinces. This union, which was perhaps a concubinage, produced a son, Constantine; he was born in Naïssus, probably in 285.2 When his military career required it, Constantius dismissed his Helena. At the latest in 285.

In 289 he married Theodora, the stepdaughter of Emperor Maximian, and in 293 he was appointed Caesar as Maximian's adopted son and considered for succession to the Western Empire as part of the order of government and succession given by Emperor Diocletian.

Helena only returned to court when her son Constantine was proclaimed emperor by the soldiers in 306 in opposition to the Diocletian system. Over the years she gained great influence. Like Fausta, Constantine's wife, she was given the title nobilissima femina, and her image appeared on bronze coins and then on gold coins. These coin images and even more so the ceiling paintings of the former imperial palace found in Trier after the war allow the personalities of the imperial women Helena and Fausta to be clearly recognized3. The portrait of the Empress Mother in the Trier frescoes, which probably date from 321, is presented in robes.

and hairstyle as in the jewelry box the first lady of the court as a
Personality, whose oriental demeanor, aquiline nose and large eyes give the impression of inner concentration. In the following years, Helena gained even more prestige. After the decisive victory of her son

At Chrysopolis in 324, which resulted in sole rule over the entire empire, Helena was given the name Augusta together with Fausta; her sole adornment with the diadem still indicated her mother's superior rank. In her old age, Helena began the pilgrimage in 326, when her son set about making Jerusalem and its surroundings Christian, and played a key role in making Palestine the holy land of Christianity.

In the east of the empire, the emperors Maximin and Licinius had maintained the state's fight against Christianity for many years. Constantine now had to push through his program of uniting the Christian church with the state all the more energetically against the firm positions of the pagans. In Palestine, a confrontation with the Jews also seemed necessary. The Jews had been forbidden to set foot on Jerusalem soil since the suppression of their rebellion under Emperor Hadrian, but they remained here and there in smaller towns in the area, which for them remained the promised land. Since the proclamation of the new message of the Risen Christ and since the martyrdom of Stephen, the Christian mission had pushed back the synagogues throughout the country; the communities under episcopal leadership had gained a firm position. Just as Jews from the Diaspora had come to Palestine since ancient times to visit the Temple and see the graves of their ancestors, Christians had also come since the 2nd century to view the scene of Jesus' life and death and to pray at the holy sites; the tradition of these places has not been lost. Now the intervention of the Christian emperor had to make the Holy Land the object of general veneration4. As Eusebius BC 3, 25-45 tells us,

Machine Translated by Google

Constantine had churches built at the site of Jesus' death and resurrection, then over the grotto of the birth in Bethlehem and the Ascension on the Mount of Olives. Helena paid particular attention to the churches in Bethlehem and on the Mount of Olives during her pilgrimage. Her work in the Holy Land has been recognized as proof of her pious attitude and also of her generosity.

From this report of the good works of the Empress Mother, Eusebius goes on to report Helena's death after her return to her son as a return to a higher life and her burial in the imperial city of Rome (BC 3, 46 f.). He praises the piety of the ruler, who now had churches built in his new capital Constantinopolis and had the sign of the Redeemer (ÿÿ ÿÿÿ ÿÿÿÿÿÿÿÿ ÿÿÿÿÿÿ ÿÿÿÿÿÿÿÿ) made of precious stones installed on the gilded ceiling of the hall in the palace (3, 48 f.). Is it not strange that Eusebius does not mention this sign of the cross in his report on the Christian design of Jerusalem? His detailed description of the Church of the Holy Sepulchre has not given modern research sufficient information to explain when and where this cross, which was later venerated in the Church of the Holy Sepulchre, was kept.5 Did not the Christians who, on the orders of the emperor, tore down the Temple of Aphrodite in Jerusalem and built the church on Golgotha, the place of Jesus' death, have to ask about the instrument of death, the cross? During the time of persecution, they had begun to venerate the graves and the instruments of suffering of the martyrs, and it had always been a matter of piety for the pagans to keep the tools and

To preserve the weapons of the heroes.

The question of the Lord's cross must have been a great concern for the architects of Christian Jerusalem. From the very first hour of the separation from the synagogue, the cross was the sign that announced salvation to Christians, but showed the Jews the iniquity of their sentence and the depravity of their unbelief. The first martyr Stephen pointed out that the Jews had already persecuted the prophets in earlier times and that they had now become traitors and murderers (Acts 7:52). In the theology of the Apostle to the Gentiles, the death on the cross was understood as the overcoming of the evil enemy, the sign of the cross as the mark of victory over the demons.

In his first letter to the Corinthians he announced the new revelation of God: “The Jews demand signs, and the Greeks seek wisdom. But we preach Christ crucified, a stumbling block to the Jews and foolishness to the Greeks, but to those who

"To the Jews and Greeks who are called to be called to be Christ, we preach the divine power and divine wisdom" (I Cor. 1:22-24). Now the proclamation of the message went beyond the Jews to the Hellenes and Romans of the wider world, without them being required to accept the old law. For the Jews, the last letter of their alphabet, the sign Tav, whether written standing (+) or lying down (X), indicated the Lord's property, while for the Christians the sign of the cross became the symbol of salvation: they marked their foreheads with the sign of the cross, giving with this signal + a reference to the name of the Redeemer7. In the theological controversies between Christians and Jews, the contrast was presented with all its sharpness, especially in the understanding of the crucified. In Justin's dialogue with Tryphon, the Jew describes the crucified as a rebel, as a cursed one; the Christian confesses the oath given in the mystery of the cross. divine calling (dial. c. Tryph. 130 -

ree. Ardiambault p. 262 f.); Tertullian explains the terrible fate of Israel from the crucifixion of Jesus (adv. Jud. 13 - CSEL 70, 314 M.); for Origenes, the death of Jesus is the surest sign that the people of Israel have been rejected by God; the Jews are raging, as he writes,

their anger against the Christians (c. Cels. 6, 27 - GChS II 2 p. 97; homil. 1 in ps. 36 - PG XII 1319 M.). Conversely, in the Talmud, Christianity is portrayed as the enemy of the first degree; the crucifixion of Jesus is explained as the death penalty of the Romans, which exonerates the Jews. However, there are also indications that individual Jews declared that a confession of guilt by their people was necessary8.

There can be no doubt that in the storm of Diocletian's persecution and then with the Christianization of the state, the antithesis between Christians and Jews became even more acute. And it is always the crucifixion that opens the abyss. In his Church History, Eusebius wants to report, among other things, on the

the communities whose bishops had not been able to attend the synod, which had set a different date for Easter than the Jews, sent a letter in which it was stated that the Jews had stained their hands with the sacrilegious crime and that the Christians had nothing in common with this hated mob (v. C. 3:17-20).

Is it not puzzling that, in this difficult confrontation between Christians and Jews over the cross, nothing is said about the cross, nothing about a search for the symbol of victory, in the contemporary reports on the building of Christian Jerusalem?

However, it was only a short time before the wooden cross was seen in the Church of the Holy Sepulchre and before reports were given about its discovery ... If nothing of the cross had been found and shown at the consecration of the basilica on the Golgotha rock in 335, we hear just 15 years later that the cross was to be seen in this church.

Machine Translated by Google

and that particles of this wood were widely distributed throughout the lands. Bishop Cyril of Jerusalem gave his catechetical instructions in the Church of the Holy Sepulchre between 348 and 350. There he speaks about the redemptive act of the Crucified and cites as proof "this holy Golgotha, on which we are now gathered for the sake of Him who was crucified on it. Almost the whole world is now filled with the wood of the cross" (Cat. 4, 10 - PG 33, 468 f.). "In these speeches he repeatedly refers to the testimony of the cross that can be seen in Jerusalem and whose particles are spread throughout the world (Cat. 10, 19 and 13, 4 - PG 33, 685 f., 776 B)9. This news of the widespread distribution of relics of the wood of the cross

is confirmed by African inscriptions. Inscriptions from Rasguniae (Rougie) and Tixtre (Toc-queville), in Roman Africa, refer to particles of tigno crucis found at the site; the text from Tixtre is dated to the year 35910. Cyril did not only refer to the wood of the cross in his teachings on the mystery of redemption. In a letter addressed to the Emperor Constantius, which most probably dates from the year 353, he states that under the beloved Constantine of blessed memory the wood of the cross was found in Jerusalem; but under Constantius, who surpassed the piety of his father, the miraculous signs did not come from earth but from heaven: the sign of victory of our Lord and Saviour, the blessed cross, shining with rays of light, was seen in Jerusalem11. This rediscovered cross of the Lord gained prestige and miraculous power in the state of the Christian emperors. Thus, in his writings, Emperor Julian was able to raise the accusation against the Christians that the Christians had abandoned the old pledge of Roman rule, the shield of Mars that had fallen from heaven, and instead worshipped the wood of the cross (Cyrill Alex. c. Jul. 194 CD - PG 76, 796 f.)12. Julian probably had a relic of the cross in mind when making this accusation.

He then explains that the sign of the cross is made on the forehead and written on house walls, but the wood (ÿÿÿÿÿ) he mentions must be the counterpart to the

The abandoned ancile must be a specific sacred object. Understood in this way, Julian's argument that the Christians went over to the dead Jew also becomes clear.

A few years later, probably in 389, John Chrysostom describes it as an act of providence in a sermon that Pilate had inscribed the Lord's cross with the inscription, because this inscription made it possible to distinguish the cross of Jesus from the crosses of the robbers (in John hom. 85, 1 - PG 59, 461)13. The preacher clearly remembers that all three crosses were found at the same time. Regarding the veneration of the Holy Cross in the Church of the Holy Sepulchre in Jerusalem, we have the testimony of the pilgrim Aetheria for the time around 394, who tells us that the relic of the cross is displayed on certain holidays for the veneration of pilgrims (Peregrin. Aetheriae 36, 5; 37, 1 - CSEL 39, 87 f.)14. The information about the beginnings of the Roman basilica of Santa Croce in Gerusaleme takes us certainly to the 4th century, and this information leads us further to Empress Helena: the basilica in which a relic of the Holy Cross was exhibited arose from the Palatium Sessorianum, which belonged to the Empress Mother, as the Liber Pontifîcalis I p. 179 states: fecit Constantinus Augustus basilicam in palatio Sessoriano, ubi etiam de ligno sanctae Crucis domini nostri Jesu Christi in auro et gemmis conclusit, ubi et nomen ecclesiae dedicavit, quae cognominatur usque in hodiernum diem Hierusalem. It is possible that the Liber Pontifîcalis here, as occasionally, confuses the Emperor Constantine with one of his sons. If this is true, the beginning of the basilica and the veneration of the cross offered there must still be dated to the time before 361

backdated15th

From these testimonies it can be concluded that the veneration of the cross in Jerusalem and the distribution of relics of this cross are certain during the reign of Constantius. From the information given by Cyril in his catechisms it can even be concluded that the cross was discovered before the year 340. Could it really have occurred in the three years between the death of the Emperor Constantine (337) and this terminus ante (340), or should we still consider the discovery under Constantine? Around the turn of the 4th century, the cross was discovered in the year 340.

Machine Translated by Google

In the 5th century, various miracle stories in the style of aretalogy appeared, which show the Empress Mother Helena searching for and finding the cross and introducing it to general veneration.

At the beginning there is Ambrose. In his speech de obitu Theodosii, delivered on the death of Emperor Theodosius in 395, he comes to speak towards the end (40 marks) about how Theodosius will now meet the first emperor in heaven who has accepted the faith; it is clear that the speaker wants to address the successors of Theodosius.
dosius pointed out the exemplary work of the Constantinian house16. Ambrosius
reports that Constantine's mother undertook to secure divine help for her son; she went to Jerusalem and searched the place where the Lord suffered in order to find the trunk of the cross. "How can I consider myself redeemed when redemption itself is not seen?" - so says Helena (43). Yes, in her speech she contrasts herself with Mary: just as she had made the incarnation of God possible, she now wants to announce redemption herself, she wants to raise the banner from the rubble (44).

Then it goes on to say that Helena was looking for the inscription that Pilate had put on the cross, that she had found this inscription and thereby the true cross.

she found the nails of the cross, had one nail made into a horse's bit, the other into a headband, and sent both to her son, who took everything over and passed it on to his descendants. "Thus the rulers who were previously persecutors are now heralds" (48). Apologetically it is summed up: "That is why the Church wishes for happiness, that is why the Jew is full of shame, and not only full of shame, but also full of pain,

Machine Translated by Google

for he himself is the cause of his confusion": in the face of the remedies that have now been found, he confesses himself to be defeated (49). As a result of the good deed of the Empress,
Mother therefore takes on the role of protecting the rulers and protecting the subjects.
Admission of the Jewish defeat. This dogmatically weighty statement makes it entirely understandable that Ambrose, at the beginning of his Aretalogy, praises Helena as the noble woman who found more to give to the emperor than she received from the imperial house (41).

Only a few years later than Ambrose's speech comes the short report on the discovery of the cross in Rufinus's Church History (He 10, 7 f.) 1 7 : Helena searches for the place where Christ hung on the cross by questioning the inhabitants of Jerusalem; she finds three crosses and also the inscription, and the true cross is only proven when a terminally ill woman is brought back to life by touching the wood. Theologically stronger is the letter written by Paulinus, a student and friend of the poet Ausonius, who lived in Nola in Campania, probably in 1444.

J. 403 to Sulpicius Severus18. Paulinus sends his friend a relic of the cross that the pious Melania brought him from Jerusalem, and connects his gift with the miraculous report of the revelation of the cross. At the beginning, the Jews are accused of doing everything to destroy the faith in Christ, as well as the pagans who built temples in Jerusalem and Bethlehem (3). Only Constantine brought about a change: "He deserves to be at the head of the

Christian ruler - more through his mother's faith than through his
own faith" (4). Enlightened by God, Helena asks her son for a free hand in identifying the holy places; in Jerusalem she asks wise and pious Christians, but also Jews, the most knowledgeable men from this community of unbelief, and receives unanimous testimony about the place. There she has three crosses dug, finds them and proves the true cross by touching the wood with a dead man, who immediately comes to life. Thus the secrecy of the cross by the Jews and the hiding of it by the pagans were overcome; the basilica was built on the site of the suffering, which preserves the cross. In this report too, the mother's faith is the

driving force to seek and find the cross.

We can refrain here from describing the legends of the Kreuzau Mindung that arose in the following centuries.19
The key to these great legends is the initiative of the Empress Mother and her relationship with the Jews. In the legend

of Judas-Cyriacus, Helena accuses the Jews of deicide, she asks learned Jews about the location of the cross and determines the true cross by raising the dead; and now Judas is converted and becomes Bishop of Jerusalem as successor to Macarius. In the New Year's Eve legend it is said that when Helena received the news of her son's conversion, she was close to accepting the Jewish faith,

and almost regretted that he had become a Christian and not a Jew. In the end, she was persuaded to be baptized by a miracle that took place before her eyes20.

As is generally the case in the realm of miracle stories and legends, the question is also valid here whether these stories could contain any reliable, perhaps even significant, historical information. What about the initiative

the Empress Mother in Jerusalem, with her turn to the Jews?

Our authoritative historian Eusebius seems to know nothing about the erection of the cross. Unless we may consider the glorification of the cross towards the end of the great speech which Eusebius gave on the 30th year of the emperor's reign (Triak. 9 ed. Heikel p. 221).
imperial buildings in Jerusalem a restrained reference to the cross:

Where the redemption is attested, Constantine decorated a very large house of prayer and a holy temple to the redeeming sign (ÿÿ ÿÿÿÿÿÿÿÿ ÿÿÿÿÿÿÿ) with rich and elaborate gifts and the great Redeemer's victory marks over death (ÿÿÿ ÿÿÿÿÿÿÿÿ ÿÿÿÿÿÿÿÿ ÿÿ ÿÿÿÿ ÿÿÿ ÿÿÿÿÿÿÿÿ ÿÿÿÿÿÿÿÿ) beautifully decorated beyond all expectations; he had done all this by proclaiming the saving sign to the whole world" (ÿÿ ÿÿÿÿÿÿÿÿ ÿÿÿ ÿÿÿÿÿÿÿ ÿÿÿÿÿÿÿÿÿÿÿ ÿÿÿÿÿÿÿ). Even if a listener or reader had thought of the cross when hearing these words21, there is no mention of the sign and only right of the emancipation by Helena. The praiseworthy report on the activity

the Empress Mother in Palestine v. C. 3, 41-45 reveals a certain restriction of her actions in the Holy Land; several new interpreters have spoken of a well-considered silence of Eusebius in matters of the Cross22. Helena

Machine Translated by Google

As we have already seen, he praises Helena for her participation in the building of churches and for her charity towards the population; she was free to dispose of imperial funds. However, it is stated with absolute clarity that the order to build churches in certain places came from the emperor himself23. This also applies to the churches in Bethlehem and on the Mount of Olives, in whose consecration Helena took a special part; he says (v. C. 3, 43) that Helena consecrated these temples “as proofs of

her piety" (ÿÿÿÿÿÿÿÿÿ ÿÿÿÿÿÿÿÿÿ ÿÿÿÿÿÿÿÿÿÿ) "the God she worshipped" (ÿÿ ÿÿÿÿÿÿÿÿÿÿÿÿÿ ÿÿÿ). Perhaps one could conclude from these words that it was only through these actions that the Empress Mother publicly acknowledged this God, for whom her son had now also newly won the land of Palestine. That she followed her son in her religious decision is clear from the words with which Eusebius, after reporting on the death and burial of the noble woman, glorifies the bond between the emperor and his mother (v. C. 3, 47): the ruler is to be praised as particularly happy because of his reverence for his mother, for “under his influence she, who had not been one before, became a

Machine Translated by Google

"So pious servant of God that one could have believed that she had been a disciple of the Savior of mankind from childhood" Here is the verdict of Eusebius One thing is clear: it was Constantine who won his mother over to the Christian faith, and he succeeded as wonderfully as if she had been taught by Jesus himself since childhood. This astonishing comparison raises the question whether The young Helena, for example, belonged to the children of Israel and was only later won over by her son, who had already found his way to the Christian Church, to this piety, to the true ÿÿÿÿÿÿÿÿÿ, in which Christians and

Jews came together24.

Helena was of Jewish origin? If this is true, then the conversion through the son takes on a different face, and Eusebius' "silent" report deserves a different explanation than has been given so far. First of all, it should be remembered that, especially around the middle of the 4th century, the turn from Judaism to Christianity was not uncommon. We learn that a confidant of Patriarch Hillel II converted and attempted to revive the Christian community in Galilee.25 Eusebius himself reports how, during Constantin's undertaking to give the Christian sites in Palestine the consecration they deserved, the place near the oak of Mamre, where in ancient times the Lord had appeared to Patriarch Abraham, was also freed from idolatry at the instigation of Eutropia, the emperor's mother-in-law (BC 3, 51-53). Constantine explained his intervention at this place with the "appearance of the prophets" (v. 3, 51-53). God, the Lord of the world," and Eusebius says - following earlier interpretations of the Holy Scriptures - quite generally, "that the same

Saviour, who recently appeared to the world, has already shown himself to pious men of Palestine in a theophany at the oak of Mamre from ancient times." A good expert on the Constantinian century has suggested that in this statement of Eutropia
and then by Constantin himself without any doubt consultation from the Jewish side took place have26.

Perhaps we may go a step further and ask whether this imperial decision was not influenced by the connection between Christianity and the faith of the patriarchs, which was firmly established by Eusebius, and the critical devaluation of Judaism that this entailed. It has recently been clearly shown how Eusebius, in his great theological works, justified the assertion, already echoed by Justin and Tertullian, that Christianity in its origins goes back to the people of the Hebrews, to the pre-Jewish era of the patriarchs, and that, on the other hand, the interim period of the Mosaic Law - the actual Jewish religion - was destroyed by the destruction of the Templars.

pels had been overcome by the Romans27. We know that this eusebisthe separation between Hebrews and Jews, which on the one hand connects the Hebrew forefathers with the eternal Logos and on the other hand enables the rejection of the Jewish religion.

was essentially completed in the Praeparatio Evangelica and the subsequent Demonstratio Evangelica around the year 324, and one can even say that Eusebius introduced the Hebrew sages Abraham, Isaac and Jacob to the

Jews28. The same Eusebius celebrated Constantine's victory during these years as the victory of the Christian Church and interpreted the ruler himself as the executor of the divine will, just as the emperor now understood himself. Now and then one would like to believe that Constantine counted himself among the Hebrews; it has even been suggested that when he was forced to kill his son Crispus for adultery in the imperial house, he saw himself as the successor of Abraham, who had been prepared to sacrifice his firstborn29.

It is obvious that this Hebrew Constantine - just like his theological interpreter Eusebius - understood the crucifixion as an act of the rejected Jews. In this theological view, the grave and resurrection were the essential events of salvation; the cross itself could be formally repressed. It may be that Constantine did not think of the cross in his work of transforming Jerusalem, just as Eusebius seems to have ignored it. But it is also conceivable that

Jews who became Christians at this historical moment understood the crucifixion as the terrible crime of the Jews, as it was in the controversy

Machine Translated by Google

between Christians and Jews, and that they declared that the retrieval of the wood of the cross and its cultic veneration were necessary to atone for the guilt. Then it is not impossible that Jews who were ready to convert helped in the search for the cross that the Jews had hidden in the time of Pilate, as is already said in Paulinus' story. And if Helena was of Jewish faith by birth, then it would be obvious that she could not count herself among the Hebrews as unhesitatingly as her son, who followed the theologian Eusebius, but that she wanted to make amends for the crime and embrace the cross. If she even thought of making all living Jews into Hebrews in this way and thus winning them over to the Christian church, then this must have contradicted her son's politics as much as Eusebius's theology, and perhaps this was a sufficient reason to remain silent about this mysticism of the cross. Silence then came less from ignorance than from not wanting to know.

But do our sources allow the possibility that Helena was originally Jewish? To put it bluntly: the little information we have about her does not exclude this possibility. The name Helena is found in the Roman

In the society of this time, like most Greek names, they belonged primarily to the class of slaves and freedmen; when Greek names are encountered in the senatorial nobility, the bearers are mostly Orientals30. We know that our Helena became the lover of Constantius as an innkeeper (stabularla); the tenants of the inns, guesthouses and taverns, as well as the people employed in these establishments, were often of Greek and Oriental origin. Among the names known from inscriptions of this professional class we encounter the names Hedone, Helpis and Hermes31. As we have already seen, the portrait of the Empress Mother also points to the Orient: the delicate woman with the fine head has the energetically curved nose - a characteristic that

then also the portrait of her son32. If Helena came from a Jewish family, then it is also possible that she was given the name of a famous personality in Judaism: the name of the daughter of King Izates of Adiabene. Josephus reports that she was won over to the Jewish religion by a Jew who was at court and then converted together with her son; later - probably around the year 40 AD - she moved to Jerusalem and built herself a palace and a mausoleum there321.

Of the information about Helena's homeland, the tradition recorded by Procop (de aedif. 5, 2), which states that she came from the small town of Drepanon in Bithynia, is somewhat reliable. We know that this town was given the name Helenopolis by Constantine, and we learn that the grave of the martyr Lucian, the learned presbyter of Antioch, who was also venerated by Helena, was in Drepanon33.

This Lucian had been the teacher of Arius; Eusebius of Nicomedia also counts himself among this famous school. Eustathius, who had been Bishop of Antioch since 324, wrote in the ongoing Christological dispute against the Arians; when he then -

When Constantine was deposed by the Antiochene Synod of Bishops probably in 328, this was because of his offensive lifestyle, but according to the testimony of Athanasius (hist. Arian. 4) because of insulting the Empress Mother Helena3 4 . Could the bishop, who was accused of having dealings with prostitutes, have perhaps referred to the innkeeper, whose profession was occasionally associated with prostitution? In 326, when Constantine himself increased the punishment for the crime of adultery by law, he also included innkeepers (dominae tabernae) in this law, while innkeepers (ministrae) were not affected by the law because of their vilitas vitae35. OMBerically, this decree, which was issued to preserve the honor of the stabulariae, was also an act of appreciation of the Empress Mother with regard to her origins, a sign of the veneration that she received in a special way during these years of the reorganization of the Holy Land. When Helena

Machine Translated by Google

dared to search for and create the cross as a warning to convert the Jews and to find neither the approval nor the opposition of her son in this undertaking, this corresponds to the special nature of her position as defined by Constantine: the elevation of her dignity and the distancing of Augusta from political power. This unique cult of her son was also evident in the honor bestowed upon the Empress Mother after her death, probably in 329.

After she had died in the presence of her son, she was taken to Rome to a mausoleum that Constantine had probably originally built for himself36. It was a kind of Christian apotheosis, since the revered lady was now far from the new

capital, far from the center of political power.

Helena Augusta, the Cross and the Jews

If we take a look at the century marked by the Constantinian turn, at the imperial legislation and at the theological position of the important church fathers of this time, we find the statement that the Jews as

rejected people, while the Christians are to be understood as the true Israel, now as the universally ruling people37. And yet - rarely enough - the idea also arises that

Machine Translated by Google

Even the Jews are included in the divine work of redemption. After the Council of Nicaea, Constantine severely condemned the Jews in speeches, letters and laws.

When the date of Easter was set (BC 3, 18 f.; see above p. 214) they were accused of being patricides and lord-killers. However, religion was not banned, only Jewish proselytism was restricted38. Christian influence can also be seen in the law of Constantine, which came into effect in later years and which prohibited the execution of the death penalty by crucifixion and leg-breaking (Aurel. Vict., Cass. 41, 4; Sozom. 1, 8, 13). One would almost believe that this law arose from the veneration of the crucified Saviour in an age which generally practised such cruel forms of execution. In sharp contrast to such piety towards the cross, indeed to the Christian faith in general, stands the Emperor Julian's devotion to the God of the Jews and to his people. This Neoplatonist found a way to recognize the God of Israel as one of the many national gods and undertook to refute Christianity in a very massive way by bringing the Jews back to Jerusalem and rebuilding the temple. Of course, this attempt, a clear counter-move against Constantine and Helena at the same time, came to a standstill due to elementary events.39 But there are signs that at the turn of the 4th and 5th centuries the antithesis between Christians and Jews became more acute and that the cross was becoming more and more popular on both sides.

It soon became necessary to prohibit Jews by law from burning an image of the Holy Cross to disparage the Christian religion (Cod. Theod. 16, 8, 18) - a prohibition which was soon violated.

has been40.

It has been repeatedly shown how the great theologians of this age have interpreted the phenomenon of Judaism. Augustine is the source of the terrible statement that the Jews through their suffering are "witnesses of their depravity and of our truth" (testes iniquitatis suae et veritatis nostrae). While Augustine still leaves the way to repentance open for individual Jews, Chrysostom states categorically that there is no improvement, no forgiveness, no justification for those who killed Christ.42 Ambrose, who evidently accompanied Helena on her way to the cross, says it again:

repeats that Israel is also included in God’s saving will and in Christ’s redemptive act43.

It would be an exciting task to trace the trusting devotion of Jews to the Crucified Christ through the centuries - up to modern Israeli art, up to the visionary image in which the Crucified Christ and an Israeli warrior with outstretched arms testify to their solidarity.

HERAKLES/MELQART: THE GREEK *FAÇADE* OF A PHOENICIAN DEITY[1]

Rodrigo Araújo de Lima[2]

Abstract: Whilst one of the most prestigious cults in Antiquity, the Greek and Roman worship to the god Herakles settle down on an ancient Phoenician liturgy dedicated to the god Melqart. With the support of epigraphy, textual documentation and archaeological material culture, it is possible to establish the differences and the proximities of these two deities. In this article, I will present some of the main theories on the origin of the divinized ancestral until its recognition as the Greek hero via *interpretatio graeca*, which culminated in the identification of the Far West of the Mediterranean as the famous *Herakles/Melqart Pillar*s.
Keywords: Melqart, Herakles, origin, liturgy, cult, Archaeology, Epigraphy, Primary Sources.

Resumo: Enquanto um dos cultos mais prestigiados na Antiguidade, a veneração grega e romana ao deus Héracles e Hércule se estabeleceu sobre uma antiga liturgia fenícia dedicada ao deus Melqart. Com o suporte da epigrafia, da documentação textual e da cultura material arqueológica é possível estabelecer as diferenças e as proximidades dessas duas divindades. Nesse artigo apresentaremos algumas das principais teorias sobre a origem do culto desse ancestral divinizado até a sua identificação com o herói grego via *interpretatio graeca*, essa que culminou no reconhecimento do Extremo Ocidente do Mediterrâneo enquanto as *Colunas de Héracles/Melqart*.
Palavras-chave: Melqart, Héracles, origem, liturgia, culto, Arqueologia, Epigrafia, Fontes Primárias.

Resumen: Como uno de los cultos más prestigiosos de la Antigüedad, la veneración griega y romana del dios Heracles se estableció sobre una antigua liturgia fenicia dedicada al dios Melqart. Con el apoyo de la epigrafía, la documentación textual y del material arqueológico, es posible establecer las diferencias y la proximidad de estas dos deidades. En este artículo presentaremos algunas de las principales teorías sobre el origen de la adoración de este ancestro deificado hasta su identificación con el héroe griego a través de *interpretatio graeca*, que culminó en la identificación del Extremo Occidente del Mediterráneo Oriental como las columnas de *Heracles/Melqart*.
Palabras clave: Melqart, Heracles, origen, liturgia, adoración, Arqueología, Epigrafía, Fuentes Primarias.

Introduction

Solar God, farmer, navigator and colonizer. The god of dying and being reborn *par excellence*. Being one of the faces of Baal, he reigns in both celestial and terrestrial space. In his egersis (Greek: ἔγερσις) - the resurrection – this divinity sets and reborn by the grace of Astarte in the endless cycle of the stars. His deity radiates into the orbit of the firmament, making Melqart the true king of the city.

Melqart is a reasonably new deity in the Tyrian pantheon, not appearing in Ras Shamra's texts and being first commented in the 9th century BCE in Aramaic written on a stele found in the Northern of nowadays the city of Aleppo (KAI 201 *apud* RIBICHINI, 1999, p. 563; NEVILLE, 2007, p. 86). Sergio Ribichini (1999) states that in the inscription dedicated to Bir Hadad, king of Aram, present Syria, the deity initially receives the epithet of a warrior god.

On the other hand, it is known much more of this Tyrian god as pointed out by Elena Moreno Pulido (2009, p. 1) as a deity essentially connected to the vegetation and fertility. This author ponders that Melqart could be an assimilation of ancestral gods like Yam or Baal. According to his fruitful and passionate attributes, common in the eastern deities, the god would rise each spring and die each winter. To Moreno Pulido, in Syrian-Palestine, Melqart accumulated along with the agrarian attributes, also marine, colonizer and civilizer characteristics, which converged in its title as the god of commerce and overseas navigation (MORENO PULIDO, 2009, p. 1).

Melqart, The Tyrian Baal (MLQRT B'L SR)

Melqart (MLQRT) could be translated as the *king of the city* with the prefix (MLK) being the title of king and the suffix (QRT) being the city. It may possibly have been vocalized as / *mīqi* / or / *melq* / (King) and / *qart* / (City). For Ann Neville (2007) his name refers directly to the city of Tyre (Ṣūr), in close relation with the ruling dynasty, being represented as the archetype of the king of Tyre, responsible for the welfare and protection of his subjects (NEVILLE, 2007, p. 86) However, in view of his chthonic characteristics, the term *city* can also be interpreted as the *world of the dead*, according to Mesopotamian traditions (RIBICHINI, 1999b, p. 563).

Although one of the youngest deities of the Phoenician pantheon, Melqart origins are ancient, dating back to the 2nd and 3rd millennia BCE. The MLQ (or could have been more than just one) who ruled Syro-Palestine

would have been deified after his death and placed as an ancestor of the reigning monarchs. The Ugarit archives refer to this late king as a / *rephaim* /, maybe a substantial number of ancestors who had the privileged status among the dead, being invoked by the ruling kings to return to their hometown to provide the fertility of the earth and healing of the sick (NEVILLE, 2007, p. 86).

In the 10th century BCE, King Hiram I of Tyre establishes the great festival of *egersis* in honour of Melqart to commemorate the death, resurrection and awakening of his deity, from human origins, deified by the Tyrians, becoming a complete god, (NEVILLE, 2007, p. 86).

According to Kormikiari, (2017, p.115) Herodotus (II, 44) is an important source concerning the cult of Melqart. According to his account, the Tyrians paid tribute to the deity as if he were a hero who would have been a mortal. The author goes on to recall that Menander of Ephesus, which in turn is cited by Flavius Josephus (*Jewish Antiquity*, VIII, 146), narrated the destruction of several temples in Tyre by King Hiram, contemporary to Solomon. The new places of worship were dedicated to the honour of Herakles (i.e. Melqart?) and Astarte. King Hiram would have been the first to celebrate the egersis of Herakles in the month of *peryton* (i.e. February-March).

According to Corinne Bonnet (1988, p. 37) the feast took place between February 16 and March 17 and would not be the only one that took place in honour of the god. Ribichini (1999, p. 565) states that there would be gymnastic games celebrated in Tyre every five years in honour of Melqart.

In the Far West, an environment also reached by the Phoenician navigators, it is likely that the Tyrians, together with the founding act of Gadir, nowadays Cadiz - archaeologically attested as, until now, a 9th century BCE foundation - also delimited an area for building a temple dedicated to the god. Possibly located on the islet of present-day Sancti Petri, to the South of the ancient archipelago of the *Gadeira's Islands*, this temple would be associated with the other two places of worship that existed in Gadir, such as Baal, supposedly located on Kotinussa, and Astarte, also allegedly located on the island of Erytheia. It is possible to reflect on the possibility that the temple was strictly related to a ritual known as egersis that would happen twice a year (LIMA, 2018).

The temple probably had a view of the navigators coming to Cádiz Bay, but nevertheless, it would have little vision of the lands of the interior of the Iberian Peninsula, making it a landmark for those approaching Gádir (LIMA, 2018).

In opposition to Bonnet (1988, p. 37) María Eugenia Aubet (2001, p. 154) states that the cult would take place in the spring, shortly after the end of the rainy season, so it is possible to consider the divinity as having both solar and agriculture attributes. José Luis Escacena Carrasco (2009, p. 112) points out that the egersis was a festival celebrated sometime between February and March. However, the author himself acknowledges that there are disagreements regarding how many times it was performed and what were its dates, which could vary throughout the year, transferring the service to June or December (ESCACENA CARRASCO, 2009, p. 112).

According to Alfredo Mederos Martín (2015, p. 194) the cult would last for three days and the entry of foreigners into the city would be prohibited as reported by geographer Pausanias in his work *Description of Greece*, written in the middle of the 2nd CE, (10, 4.6):

> Κλέων δὲ ἀνὴρ Μάγνης, οἳ τῷ Ἕρμῳ προσοικοῦσιν, ἔφασκεν ἐς τὰ παράδοξα ἀπίστους εἶναι τῶν ἀνθρώπων οἷς ἂν μὴ παρὰ τὸν αὐτῶν γένηται βίον θεάμασιν ἐπιτυχεῖν λόγου μείζοσιν: αὐτὸς δὲ καὶ Τιτυὸν καὶ ἄλλους ἔφη πείθεσθαι γεγονέναι κατὰ τὴν φήμην: τυχεῖν γὰρ δὴ ὢν ἐν Γαδείροις, καὶ ἐκπλεῦσαι μὲν αὐτός τε καὶ τὸν ἄλλον πάντα ὄχλον ἐκ τῆς νήσου κατὰ τὸ Ἡρακλέους πρόσταγμα, ὡς δὲ αὖθις ἐπανήκειν ἐς τὰ Γάδειρα, ἄνδρα εὑρεῖν θαλάσσιον ἐκπεπτωκότα ἐς τὴν γῆν: τοῦτον πλέθρα μὲν πέντε μάλιστα ἐπέχειν, κεραυνωθέντα δὲ ὑπὸ τοῦ θεοῦ καίεσθαι. (SPIRO's version, 1903)
>
> Cleon of Magnesia on the Hermus used to say that those men were incredulous of wonders who in the course of their own lives had not met yet greater marvels. He declared that Tityos and other monsters had been as tradition says they were. He happened, he said, to be at Cadiz, and he, with the rest of the crowd, sailed forth from the island in accordance with the command of Heracles;1 on their return to Cadiz they found cast ashore a man of the sea, who was about five roods in size, and burning away, because heaven had blasted him with a thunderbolt (Translation of JONES, LITT and ORMEROD, 1918).

As in the account, the liturgy would consist in the immolation of the god in the midst of a final ritual of his cremation, with the intention of his rebirth and immortalization by the virtue of fire (AUBET, 2001, p. 153-154). For Bonnet (1988, p. 79) there would be, on the first day, a succession of ritual events where the god was burned on a pyre. Besides this, would be an altar where animal and vegetable offerings were made. On the second day, the god

was buried in the presence of his priests, the king, and a female character, possibly a priestess, who would wear horns and a sceptre representing Astarte, Melqart's goddess. At dawn on the third day, the god would rise with two birds in his hands.

However, for Mederos Martín (2015, p. 194) on the first night of the liturgy, women held celebrations, holding vigils, lamentations and funeral banquets. On the second day, the Phoenicians were in procession toward the sea, carrying the wooden representation of the god to the coast and setting it ablaze. On the third day, the resurrection of the god occurred.

From the divergences between the modern authors as to how the celebrations were held, it seems that different liturgies could exist between Tyre, Gadir and possibly the other Phoenician foundations. However, the existence of a liturgical archetype of the celebration, such as the constitution of three days of events in one or two periods of the year, is noticeable. The change of season also seems to be one of the canons of this ceremony, with spring being the most recurrent. Possessing also chthonic aspects, the act of public immolation of the god's image to the faithful would represent the beginning of a fertile period, where the earth would be at the peak of its fertility.

In Tyre, within the celebration would happen the *hieros gamos* (Greek: ιερός γάμος) time which the monarch attended the feasts and joined with a priestess of Astarte or the queen herself, interpreting (or doing it) the sexual intercourse union between Melqart and Astarte (AUBET, 2001, p. 154). Mederos Martín states that the union happened during the god's death (2015, p. 194). There would also be in this celebration an individual charged with carrying out the resurrection of divinity.

Known as MQM 'LM, this priest was primarily responsible for the liturgy of Melqart's egersis. He would be, according to Escacena Carrasco (2009, p. 111), the most knowledgeable of the Sun cycle. It would probably be an astronomer in charge of announcing to the priests the death of the god, based on the counting of the days and the reading of the stars. From the egersis, there is/was only a marble vase from Sidon (fig. 1), dating from the 4th century BCE which narrates the practices of the celebration, woefully lost during World War II.

Escacena Carrasco points to the main character of this vase as Baal, however, this deity could designate Melqart since both possess solar qualities and are often confused by the epithet B'L (2009, p. 110). The inscriptions of the Sidon Vase, contain Melqart's binding with the fire by the epithet B'L KR. According to Elena Moreno Pulido (2011), as an ambivalent element, fire

favours both life and death. Melqart's decaying body would then be immolated by the flames for the renewal of his creative energies as the fields are burned (fire-fallow cultivation) for his most fertile return (MORENO PULIDO, 2011, p. 106).

The Sidon Vase disappeared from the Berlin Museum during World War II, making it impossible to search for a better understanding of the liturgical practices of egersis from this artefact. Fortunately, photographs were taken of the faces of the vase representing different moments of the celebration.

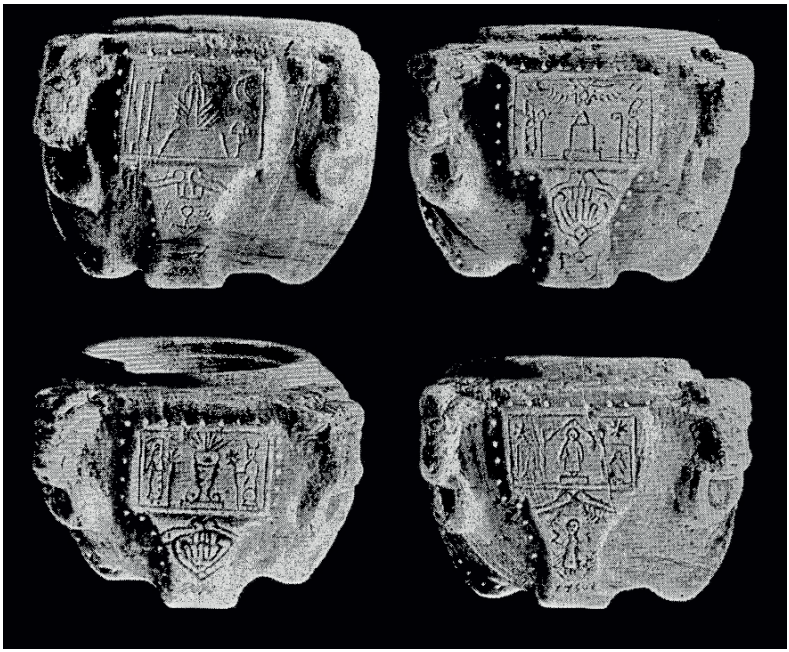

Fig. 1 - Sidon vase. Inverted colours for easier visualization of the decoration (ESCACENA CARRASCO, 2009, p. 108). Edited by Rodrigo de Lima, 2019.

From the previous notes (pages 3-4), I consider the temple of Melqart, closely linked with the shrine of Astarte. Thus, it's plausible to think on the coexistence of both from the beginning of the foundation of Phoenician cities as in the case of Gadir (MEDEROS MARTÍN, 2015, p. 194). Maybe in the form of natural landmarks, inasmuch as the archaeological register lacks the religious structures of these places.

In the 7th century BCE, the god appears as Milqartu, being as Eshmun, the mediator of an agreement between the king of Tyre, Ba'alu, and the king of

Assyria, Assar-adan. If the treaty were breached, the two deities would punish the transgressor by destroying their lands and enslaving their people. The disobedient would still be deprived of food, clothing and olive oil (SAA 2, 5 IV: 14; ANET, 534 apud RIBICHINI, 1999, p. 563). In another 9th century BCE testimony, the god is attested as Melqart Lord of Ṣūr (MLKRT BSR) (BORDREUIL 1990, p. 19 *apud* RIBICHINI, 1999, p. 563).

Herakles Archegetes (Ηρακλής αρχηγέτης)

According to the interpretation of Manuel Álvarez Martí-Aguilar (2014), based on Pompeu Trogo's account (44.5) the spread of the Melqart cult in Iberia would have occurred prior to the founding of Gadir. The same author states that the city of Carteia, in present-day San Roque, would be a possible candidate for the establishment of a foundation dedicated to Melqart. According to this interpretation, Carteia would have been founded by the Gadirites (i.e. the citizens of Gadir) who began their expansion along the Atlantic and Mediterranean shores and was referred by the ancient authors as Heraclea since it was believed to have been founded by Herakles (2014, p. 26).

> ἐνταῦθα δὴ ὄρος ἐστὶ τῶν Ἰβήρων τῶν καλουμένων Βαστητανῶν, οὓς καὶ Βαστούλους καλοῦσιν, ἡ Κάλπη, τῇ περιοχῇ μὲν οὐ μέγα τῷ δ᾽ ὕψει μέγα καὶ ὄρθιον ὥστε πόρρωθεν νησοειδὲς φαίνεσθαι. ἐκπλέουσιν οὖν ἐκ τῆς ἡμετέρας θαλάττης εἰς τὴν ἔξω δεξιόν ἐστι τοῦτο, καὶ πρὸς αὐτὸ Καρτηία πόλις ἐν τετταράκοντα σταδίοις ἀξιόλογος καὶ παλαιά, ναύσταθμόν ποτε γενομένη τῶν Ἰβήρων. ἔνιοι δὲ καὶ Ἡρακλέους κτίσμα λέγουσιν αὐτήν, ὧν ἐστι καὶ Τιμοσθένης, ὅς φησι καὶ Ἡράκλειαν ὀνομάζεσθαι τὸ παλαιόν, δείκνυσθαί τε μέγαν περίβολον καὶ νεωσοίκους. (STRABO, Geography. 3.1.7, versão de MEINEKE, 1877).

> Here is situated Calpe, the mountain of the Iberians who are denominated Bastetani, by others Bastuli. Its circumference is not large, but it is so high and steep as to resemble an island in the distance. Sailing from the Mediterranean into the Atlantic, it is left on the right hand. At a distance of 40 stadia from this [mountain] is the considerable and ancient city of Carteia, formerly a marine arsenal of the Iberians. Some assert that it was founded by Hercules; of this number is Timosthenes, who tells us it was anciently called Heraclæa, and that vast walls and ship-sheds are still shown. (STRABO, Geography. 3.1.7, translation by HAMILTON and FALCONER, 1903).

There is no new speculation about the name Carteia, Drietich (1936) and Millás (1941) according to Martí-Aguilar (2014, p. 27) already considered Carteia as a theophoric nomination, which may be the abbreviation of MLQRTYH (i.e. Island of Melqart?).

During the 2nd century BCE, in Malta, a bilingual inscription (KAI 47) (**fig. 2**) reveals Melqart as being equivalent to Herakles ἀρχηγέτης. This same epigraph considers the god to be Ṣūr›s Baal (B›L SR). Here I recall that Baal, besides being the supreme god of the Phoenician pantheon, also is translated as a honorific title of *Lord* / *Chief*, making Melqart the Lord of Tyre.

Fig. 2 – One of the two Malta's *cippi* at the Louvre Museum. The bilingual inscriptions initially at the top in Phoenician and the base in Greek. The image has been modified for better identification of the writing on the base. Available at: https://tinyurl.com/y248otgz, accessed 9/4/2019. Edited by Rodrigo de Lima, 2019.

1. ΔΙΟΝΥΣΙΟΣΚΑΙΣΑΡΑΠΙΩΝΟΙ
2. ΣΑΡΑΠΙΩΝΟΣΤΥΡΙΟΙ
3. ΗΡΑΚΛΕΙΑΡΧΗΓΕΤΕΙ

Version: "(1) Dionysus and Serapion, the (sons) (2) of Serapion, Tyrians; (3) to the Heracles founder". According to Sznycer (1975, p.195).

This religious syncretism and the concept that this god was once a man may be the key to understanding how Melqart will be interpreted by the Hellenics and the Latins (NEVILLE, 2007, p. 86). The Greek Heracles and Roman Hercules are divinized heroes, whose, as Melqart were both mortal and immortal.

In addressing the patterns of economic activity in ancient societies, Eleftheria Pappa (2010) comments that temples would play a central role in securing trade treaties, while this would also be strengthened by family ties that would ensure trade security, especially those dedicated to Melqart. The author points out that supernatural sanctions such as swearing to the gods were endogenous features of ancient societies. To this end, Pappa presents the example of the treaty regulated by divine forces that sealed the vassalage agreement between Assyrian King Assar-adan and the Tyrian prince Ba'alu in the first half of the 7th century BCE. This agreement warned that, if broken, it would incur the wrath of the gods, causing shipwrecks in a windstorm.

Apart from the issue of contracts, Pappa argues that religious syncretism could also regulate economic mechanisms, in what she defines as an *investment in trust* since it merged patron cults and deities to protect negotiations as well as they would also reduce costs and facilitate technological exchanges (2010, p. 284-285).

Melqart's temples are closely linked with the expansionist enterprise. According to Diodorus Siculus (20: 14.1), Melqart, referred in one passage as Heracles, accompanied the founding of the new cities. Given their function, their sanctuaries are always in relation to the sea, in environments that could be frequented by sailors and merchants. The foundation of settlements is usually accompanied by the establishment of this sacred place. Unlike Astarte, Melqart was not part of the indigenous cults (NEVILLE, 2007, p. 87).

Pappa comments that the monuments dedicated to Melqart, where Phoenician trading posts are known as MQM, possibly vocalized as / *maqom* /, would probably have been installed to extend worship to non-Phoenician communities in order to foster trade (2010, p. 285). According to Cristina Kormikiari, / *maqom* / would be an emporium-sanctuary, that is, it could be part of a religious centre as well managing business practices and agreements (KORMIKIARI, 2015, p. 88).

On this religious syncretism, there is an example of another locality that was supposedly frequented by the Phoenician communities such as the island of Thasos where a large Herakleion was located southwest of the city agora, at the main entrance of the *asty* (Greek: ἄστυ) of Limenas. Juliana Hora (2018) reminds us that according to Herodotus (*Histories*, II, 44) Herakles was perhaps one of the most important patrons of Thasos. This male deity was often represented in the coins and his worship would have been, according to the tradition, implanted by the Phoenicians (cf. Hora, 2018).

Gaditanian Herakles (Hercules-Gaditanus)

Fig. 3 - One of the five *ex-votos* found near the islet of Sancti Petri. One can notice the Egyptian characteristics. Available at: https://tinyurl.com/y5hlkxpd, accessed 9/15/2019. Edited by Rodrigo de Lima, 2019.

The sacred environment of the Herakles / Melqart temples would be part of a strategy for treaty-signing with other peoples, as is believed to have occurred in the Iberian Peninsula. Under the aegis of divinity, commerce was carried out by establishing relations between allochthonous and autochthonous. According to Neville (2007, p. 87) Herodotus (II.115) suggests that the Phoenician temples were places of asylum for sinking travellers, as well as offering the practice of sacred prostitution of both sexes, a hospitality practice that may have corroborated for the attendance of these sacred environments.

Concerning liturgical practices and their participants, Zamora López (2017) identifies the MQM'LM, probably vocalized as / *mīqimʾēlīm* / official directly linked to the egersis during the Melqart cult. Through epigraphic evidence in Greek there is indication that in the resurrection ritual of the Tyrian Herakles, there would be one responsible for the cult. This officer would be the *egerseites toû Hērakléous* equivalent to / *mīqimʾēlīm* /. The author notes that often to this occurrence there is a second expression, MTRḤ'ŠTRNY, which helps to detail the role of the officer. Interpreted as a possible reference to Astarte. Thus, Zamora López (2017, p. 66) proposes that during these rituals, the / *mīqim ʾēlīm* / would consummate the marriage of the two deities, who also represented the monarchy and the priesthood. To suppress the lack of a Phoenician word for the name of this holiday, Kormikiari introduces the term / *marzeah* / or / *marzeh* /, using both Hebrew, Ugaritic, Phoenician, Punic and Aramaic to, according to the author "designate the liturgical celebration of a banquet that also included a sacrifice in honour of a deity"(KORMIKIARI, 2004, p.139).

In fact, Cadiz archaeological remains found on the city's beaches show an innumerable accumulation of inhumations and cremations associated with ressignified dry wells as sacred deposits and faunal remains that would have been consumed, such as wine, incense, olive oil and aromatic oils (cf. LIMA, 2018, pp 256-402). Also found are animal sacrifices that corroborate the liturgical practice that the Gadirites would celebrate for their dead a banquet in honour of the dead or dedicated to a deity. The term / *marzeah* or *marzeh* / denotes both the festival and the religious body. It is supposed to consist only of a small group of the great Phoenician citizen families (MARKOE, 2000, p.120; KORMIKIARI, 2004, p.139; NEVILLE, 2007, p. 73-74).

From the temple of *Melqart gadirite*, later known as *Hercules Gaditanus*, there was nothing left architecturally, only five ex-votos representing the image of the deity (**fig. 3**) were recovered, as well as a few later bronze statues, since this great temple, was intensely visited by important characters, from Hannibal to Julius Caesar. The temple was allegedly destroyed by Alí ben `Isá ben

Maymūn in 540 CE, yet its monumentality was immortalized in the verses of poet Abu Utman al-Saduni (apud ALMAGRO-GORBEA, 2014, p. 162):

> (...) hay un negro que está de pie en la cima de un pináculo, / como si sobre él estuviera crucificado el viento. / Adelanta la pierna derecha y casi la alza, / como quejándose de un esfuerzo descomunal. / En la diestra presenta una llave que tú tomarías por ofrenda, / si no fuera porque él está compungido. / Y un pergamino en la izquierda, mano que lleva cerrada como si nos quisiera ocultar su contenido. De la mar señala el poniente y su región / mirando erguido hacia el ocaso del sol […] / Os digo que en sus noticias hay un portento, / así que no preguntéis / si es de oro o de latón (...).
>
> (...) There is a black figure standing on a pinnacle as if the wind crucified him. Advance with the right leg almost upwards. Like he was making a huge effort. In his right hand, he holds a key that you would take as an offering, if not because he is sorry. And a scroll on the left, a hand that is clenched as if to hide its contents. From the sea it points to the west and its region, aiming high at the sunset (...). I tell you that in your news there is something spectacular, so don't ask me if it was gold or brass (...). (My version).

According to Moreno Pulido, Melqart / Herakles is the true titular god of the Extreme Western region of the Mediterranean Basin. The author states that the myth of the oracle of Tyre, the hometown of this divinity, would have been one of the reasons why the Strait of Gibraltar became known as the *Pillars of Hercules* (2009, p. 1).

However, for Pappa, as far as the western Mediterranean Basin is concerned, the term *Pillars of Heracles / Hercules* does not allude to the rocky group bordering the Mediterranean Sea (in this case, the Rock of Gibraltar and the hill of Ceuta). For the author, this term would only be a poetic play of words about the temples erected by the Phoenicians in Gadir (Spain) and Lixus (Morocco). It would, therefore, have been the *interpretatio graeca* of the Phoenician entrepreneurs since the Herakles expeditions would have taken place in the same region (2010, p. 285).

Final Thoughts

In this article, I intended to introduce Melqart / Herakles as a deity that was part of the Mediterranean Basin serving as an important agent in the enterprise of maritime expansion, as well as in the mediation between allochthonous and autochthonous communities. Whereas religiosity is established

as a point of contact between the different, the rites would also function as a mechanism of differentiation. As is evident from Kleon of Magnesia's account that he is obliged, along with his crew, to depart from Gadir, probably ordered by the inhabitants and the priesthood of the city. This account demonstrates how the civic body would behave at the time of religious festivities. This deity that dies and is resurrected by virtue of fire also presents itself as an essential element in the establishment of festivities that marked the beginning of a new season, guiding the calendar by way of the stars. Thus, the joy was reserved for the Phoenician community as the mourning of the liturgy of Melqart's death and rebirth. This would have helped in strengthening the local identity before foreigners. Through its cycle of living, dying and being reborn, Melqart / Herakles has become a symbol of power, expansion and fundamentally connection by blending into the different worldviews of the most varied Mediterranean communities.

Acknowledges

I would first like to acknowledge the Coordination for the Improvement of Higher Education Personnel (CAPES) for the support given during the writing of my master's dissertation, which culminated in this article. And also I would like to thank the São Paulo State Research Support Foundation (FAPESP), for the current development of our PhD's thesis, research that keeps its focus on understanding the dynamics among the communities that settled in Iberia in Antiquity and dialogues intrinsically with this article.

TAXES AND TRADE IN THE ROMAN EMPIRE (200 B.C.–A.D. 400) *

By KEITH HOPKINS

This essay is speculative and tentative, a preliminary attempt at exploring a broad territory of Roman economic history over a long period. For the sake of clarity, I have canvassed several probabilities in the form of propositions, but the evidence is so sparse that it is difficult to *prove* that each proposition is right. It is disappointing to confess at the outset that one's case is unproven and that the generalizations advanced are disproportionately large in relation to the supporting evidence.[1] Even so, the experiments made here with both evidence and methods may stimulate others into refuting or reshaping the propositions. And besides, some of the methods can be usefully applied to other problems in Roman history.

Propositions 1 and 2

The first proposition is that the Romans' imposition of taxes paid in money greatly increased the volume of trade in the Roman empire (200 B.C.–A.D. 400). Secondly, in so far as money taxes were levied on conquered provinces and then spent in other provinces or in Italy, then the tax-exporting provinces had to earn money with which to pay their taxes by exporting goods of an equal value.[2]

These two propositions may seem unexceptionable, but their applications are interesting. At the risk of simplification, they lead us to envisage the Roman empire in the central period of the High Empire (the first two centuries A.D.) as comprising three spheres:

(A) an outer ring of frontier provinces in which defensive armies were stationed,
(B) an inner ring of relatively rich tax-exporting provinces, such as Spain, southern Gaul, northern Africa, Asia Minor, Syria and Egypt,
(C) the centre, comprising Italy and the city of Rome, the seat of the Court and of the central government, which, like the armies on the frontiers, consumed a large volume of taxes.

The armies on the frontiers (A) and the city of Rome, the Court and the central government (C) consumed more taxes than were produced locally. The two propositions imply that in the long run, on average, these tax-importing regions (the frontiers and the city of Rome) imported goods to a value which roughly equalled the imported tax.[3]

The main focus of this paper is on large-scale inter-regional flows of taxes and trade. But large-scale flows were the cumulative result of myriads of local transactions and transformations. Even at local levels, the Roman imposition of money taxes and their expenditure outside the region where they were levied had a serious impact on simple cultivators; they were forced to produce, and to sell, more food in order to pay taxes. The impact was greatest in those regions in which simple cultivators had paid little or no tax in money before the Roman conquest. There, cultivators were forced to produce and sell a surplus which they had not previously produced, or which they had previously consumed themselves (afterwards they simply went without). Some of this surplus was

* An earlier version of this paper was first given in the American Academy at Rome by kind invitation of its then Director, John D'Arms. I am most grateful to him and to the members of his seminar for hospitality and criticism. I want also to thank Sir Henry Phelps Brown and Alan Budd for kindly helping me along with economics; I am very much indebted to Michael Crawford for guidance, and not only on numismatic matters. Finally, I should like to thank Graham Burton, Ronald Mellor, John North and members of seminars in Cambridge, Durham and the Institute of Historical Research in London for their critical thoughts. Inevitably, on this topic, my paper is written in friendly debate with Sir Moses Finley and his *The Ancient Economy* (1973).

[1] I shall concentrate here on argument and on the economic structure of the Roman empire, rather than on what Romans thought they were doing or on surviving sources. I have adopted this tactic simply because I want to cover a broad canvas in a relatively short article, not because I feel that the Romans' own economic thoughts or writings should be neglected. But it does mean that some of the conventional sign-posting is missing.

[2] I must stress the correlative form of the second proposition: In so far as . . ., then . . . (in so far as . . .). For the moment, I make no estimate of the volume of taxes, nor of the extent to which they were raised in money.

[3] These two propositions also imply an explanation for the increase of imports into Italy during the High Empire. I do not mean that Italy stopped exporting, only that the balance of trade favoured imports; the explanation is to be sought more in economic forces than in an Italian moral decline.

probably shipped direct to tax-consuming regions (for example, Spanish olive oil to the city of Rome). But the costs of transporting staple foods for long distances, especially overland, were high;[4] besides, tax-consuming regions grew some of their own food and in addition drew upon taxes levied in kind (for example, wheat sent to the city of Rome).

The two propositions imply another process, which we can guess at in simple terms. In economically unsophisticated regions, peasant tax-payers increasingly sold some of their primary produce in local markets in order to raise money with which to pay taxes. The food which they sold was consumed locally by artisans, who made goods of higher value and lower volume than staple foods (for example, textiles, leather goods, pots). Again some of these hand-made, relatively valuable goods were consumed locally; but others were exported from inner provincial towns, both to the frontier provinces and to the city of Rome.[5]

This simple model implies a whole series of small-scale changes in production, distribution and consumption, whose cumulative impact over time was important. There was a significant increase in agricultural production, an increase in the division of labour, growth in the number of artisans, in the size of towns where many of them lived, development of local markets and of long-distance commerce. Complementarily, there were changes in the pattern of consumption: government employees, soldiers and officials, received tax monies as pay and spent their money on food, services and artisan-made goods, some of which came from the distant provinces which paid the original money taxes. There was an increase in the number of people who made it their job to look after the needs of soldiers on the frontiers and of officials in the city of Rome. Thus the model implies an increased monetization of the Roman economy, the commercialization of exchange, an elongation of the links between producers and consumers, the growth of specialist intermediaries (traders, shippers, bankers), and an unprecedented level of urbanization.[6] The model illustrates the close connection between changes on the level of individual action by simple peasants and relatively large-scale changes, such as the growth of towns.

These changes were most dramatic in regions which were economically primitive before their conquest by the Romans. But there were regions, such as Syria and western Asia Minor, which had paid money taxes to local rulers for centuries before the Roman conquest, regions which were already urbanized and had well-established networks of intra-regional and inter-regional trade. Other regions lay between these two extremes of economic simplicity and sophistication.[7] Conquest by the Romans disrupted established patterns even in economically advanced regions: the Romans plundered the stored reserves of generations, from towns, temples and from rich individuals' treasure chests. They siphoned off skilled and unskilled labour as slaves; they gave loans to oppressed landowners and then distrained upon their estates, when they were unable to pay extortionate

[4] The problem of how much staple food was transported, long-distance overland or by ship, cannot be solved simply by pointing out the high *relative* cost of land transport. That alone did not make it *absolutely* prohibitive. I suspect that availability of transport, information and trader organization were also important. Comparative evidence illustrates the problems. In Italy in the sixteenth century, staples were occasionally transported from the eastern coast of Italy overland to the city of Rome (J. Delumeau, *La vie économique et sociale de Rome* (1959) II, 521 ff.), but in southern France in the same period, the volume of transport available for carting supplies between towns was too small to even out inter-city variations in price (R. Baehrel, *Une croissance: la Basse Provence rurale* (1961), 531 ff.).

[5] Archaeological evidence is uncorrectably biassed by the survival of pots, which cannot have been so important in the Roman economy. The salvation is that surviving pots can reasonably serve as proxy for perishable goods such as textiles, which have not survived archaeologically but which probably were important economically. Thus distribution maps of pots illustrate the viability and direction of long-distance trade. For one example see D. P. S. Peacock in J. du Plat Taylor and H. Cleere (edd.), *Roman Shipping and Trade: Britain and the Rhine Provinces, The Council for British Archaeology Research Report* 24 (1978), 49.

[6] On the growth of towns, see especially M. I. Finley, 'The Ancient City: From Fustel de Coulanges to Max Weber and Beyond', *Comparative Studies in Society and History* 19 (1977), 305 ff.; K. Hopkins, 'Economic Growth in Towns in Classical Antiquity', in P. Abrams *et al.* (edd.), *Towns in Societies* (1978), 35 ff., where several of the issues discussed here are put in a different form.

[7] Once again, I am for the moment concerned more with the logic of the argument than with the evidence by which one could allocate regions conquered by the Romans along a continuum of economic sophistication, or lack of it. I am certainly not assuming that all western provinces were economically primitive before the Roman conquest. I suspect (though how would one prove ?) that they did become more sophisticated after conquest by the Romans. Cf. note 13 below.

rates of interest. The plunder of capital, labour and land, the loans and the debts, were short-term adaptations to the long-term redirection of taxes and trade. The local population had to accommodate the fact that taxes were no longer spent in the regional metropolis, but far away in the city of Rome or in the frontier provinces. In the long-term, as we know, the inner-core provinces were not impoverished by the Roman conquest; indeed, it is plausible to assert (but difficult to prove) that these economically advanced regions adapted to the changed conditions under Roman domination so well, that in the High Empire they reached a level of general prosperity equal to or higher than any reached previously.[8]

Some qualifications

Up to now I have concentrated on the reciprocal flows of taxes and trade, their cumulative impact and their contribution to the integration of the economy of the Roman empire. I have stressed the growth in production and consumption, the increasing monetization of the Roman economy and the commercialization of exchange. But several qualifications deserve equal emphasis. Firstly, the complex networks of tax-stimulated trade were only gradually established in the wake of Roman conquest, after considerable initial disruption. Secondly, much trade flowed without the stimulus of money taxes. It was based on reciprocal needs and on the location both of supply and of demand. For example, only some districts had a readily available supply of metals, such as gold, silver, copper or lead, for which the demand was widespread. Hence an important export trade all over the Mediterranean basin.

Thirdly, the pattern and volume of demand was also heavily influenced by fluctuations in rainfall. At first sight, the unity of the climate in the Mediterranean basin might suggest a uniformity of crops grown throughout the region, and therefore no necessity for long-distance trade in staple foods (wheat, barley, wine, olive-oil). But sharp inter-annual fluctuations of rainfall created local gluts and local shortages and stimulated unpredictable flows of surplus staples to unpredicted markets; hence small-scale (but in aggregate large-volume) inter-regional trade in staples, mostly sea-borne.[9] The volume of demand, that is the capacity to pay for food and goods brought over a long distance, was a function both of production over and above the level of minimum subsistence and of inequality. Let me mention, just in passing, that the simple categories, élite/peasantry, luxury trade/trade in staples, cannot do justice to the complexity of demand within the Roman economy. In my view, such simple divisions lead implicitly to a serious underestimate of the sophistication, variety and volume of goods commonly traded in the Roman empire.[10]

Fourthly, many taxes were raised in kind. These taxes in kind, such as wheat from Egypt and North Africa, stand outside my two initial propositions. Taxes in kind do not stimulate trade, because such produce flowed only in one direction from tax-payer to tax-consumer. Indeed, taxes levied in kind limited the sphere of market or monetary transactions; and they tempted the Roman government to have produce transported (such as wheat distributed free of charge to over two hundred thousand persons in the city of Rome) without consideration of the total cost.[11] The volume of such flows reflected political power; they affected, but they did not depend on, the level of trade.

[8] The concept, general prosperity, is purposely vague. We know that the rich were rich, and we admire great public buildings, such as the theatre at Aspendos or the temples at Petra and Palmyra. But how can we know about the distribution of wealth, and the standard of living of relatively poor townsmen or peasants?

[9] 'Traders roam from sea to sea looking for some market which is badly stocked', so Philostratus, *Life of Apollonius of Tyana* 4. 32. Inter-annual fluctuations of rainfall have been largely ignored by ancient economic historians, perhaps because no ancient source mentions them. See the *International Yearbook of Agricultural Statistics* for modern national figures.

[10] The most exciting documents which illustrate the nature of ancient Mediterranean trade are the Geniza papyri from Cairo, dating from the tenth century A.D. onwards (see S. D. Goitein, *A Mediterranean Society* I (1967)). Nothing from the classical period can rival them. In spite of their late date, they are useful for Roman historians. The long lists of produce in T. Frank, *ESAR*, passim, reflect an antiquarian idea of what economic history should be. The main questions should be: which organizations of traders, by what mechanisms (partnership, investment, credit, cash?), sold how much of what to whom? Even the customs lists at Zarai, Numidia (*CIL* VIII, 4508) and Palmyra (OGIS 629) do not help us reach an answer to these questions.

[11] Augustus, *Res Gestae* 15; D. van Berchem, *Les distributions de blé et d'argent à la plèbe romaine dans l'empire* (1939); cf. the Chinese experience in supplying Peking: H. C. Hinton, *The Grain Tribute System of China* (1956).

Finally, the economy of the Roman empire, in spite of its sophistication in some respects, was predominantly a subsistence economy. The monetary economy constituted a thin veneer of sophistication, spread over and tied to the subsistence economy by the liens of taxes, trade and rent. The concept, subsistence economy, has important implications. The bulk of the labour force in the Roman empire, perhaps 80–90 per cent, were primarily peasants who produced most of what they themselves consumed and consumed most of what they produced. This solid mass of self-sufficient production always stood outside the money economy. However, this cellular autarky of individual peasant farmers and of most districts was penetrated, but not pervaded, by outside demands. By this I mean that peasants were affected, even burdened, by demands for taxes, for rents and for goods bought in the market (such as knives, or clothes). But the payment of taxes and rents constituted only a minor element out of total production, even if they constituted the major part of peasants' disposable surplus.[12] The term, subsistence economy, also implies that on average levels of consumption were not dramatically above the minimum level of subsistence. Here again, several distinctions should be made. In general, Roman levels of consumption were obviously and significantly higher than pre-Roman levels of consumption, at least in the western provinces.[13] Not only was the Roman élite extremely rich, but the lower strata of the empire's population were differentiated; even among the poor there were differences; hence the high volume of aggregate demand for traded food and goods. That said, the *average* level of consumption was not high. Under proposition 6, I shall try, rather rashly, to estimate how much of their total produce the subjects of the Roman Empire paid in tax, and to gain some idea about how much on average they lived above the level of minimum subsistence, and finally to gauge, albeit inadequately, the thickness of the monetary veneer.

Proposition 3: rents and taxes

Rents, in many respects, functioned in a similar way to taxes. Both were charges on the surplus produced by peasants, which helped support the superstructure of Roman society.[14] Proposition 3 is simply a corollary to propositions 1 and 2: conquest by the Romans brought about an increase in the amount of rent paid, especially in the western provinces. In so far as money rents were levied and then spent away from the farms or districts in which they were levied, to that extent money rent-paying farmers had to earn money with which to pay their rents, by selling crops or labour, equal to the value of the rent. Put formally like that, it sounds innocuous, obvious. But the process was important locally as well as inter-regionally. The imposition of money rents implied an expansion of the market for peasants' crops, both in local towns and beyond. Local landowners resident in towns away from their estates and provincial élites who spent their incomes derived from rents in the chief provincial towns helped create local networks of trade.

[12] Two cautions. First, not all peasants paid rent, and the categories rentier/free holder/tenant overlap, since many small landowners in the course of the family cycle supplemented their livelihood by renting out surplus land or by renting it in. This is clear from the evidence of Roman Egypt and is explained theoretically by A. V. Chaianov, *The Theory of Peasant Economy* (1966). Secondly, I do not wish to imply that the surplus was fixed in size. Indeed, I argue that the demand for taxes and rent probably increased the size of the surplus produced. Moreover, the concept 'disposable surplus' is an objective account of what was produced over and above minimum subsistence. Peasants themselves may not have thought of it as surplus, although the concept did exist in classical times.

[13] This can be illustrated, but not, I think, proved. Roman levels in excavations reveal more artefacts than pre-Roman levels: more coins, pots, lamps, tools, carved stones and ornaments—in sum, a higher standard of living. Since archaeologists seem very reluctant to write synoptic works, I cite four corroborative illustrations from different regions: M. Clavel, *Bezières* (1970), 332; A. Schulten, *Geschichte von Numantia* (1933), 154–5; J.-P. Callu, *Thamusida* (1965), 187 ff.; C. H. Kraeling, *Ptolemais* (1962), 270 ff.

[14] Were rents paid in money? Wealthy landowners living in the city of Rome clearly needed large amounts of money to spend, as well as produce from nearby estates. Cicero (*Paradoxa Stoicorum* 49) expressed income in money terms, not in wheat, and much later Olympiodorus (frag. 44) declared that Roman aristocrats in the fourth century A.D. received one quarter of their incomes in kind. Income from large estates given to the Roman church by Constantine (*Liber Pontificalis*, ed. L. Duchesne (1886) 1, 170 ff.) was also mostly in money, and some of what was to be paid in kind was not grown on the estates but had to be bought in the market. The Igel monument of the third century A.D. does not show money payments by tenants, but payments made to workers—see the convincing arguments by J. F. Drinkwater, *Trierer Zeitschrift* 40/1 (1977/8), 116. My fragmentary illustration reflects the neglect of rent by Roman historians.

The increased wealth of the central Roman élite (senators and some knights) was funded largely by rents drawn from estates scattered over many districts and regions. Expenditure of rents by absentee landowners in cities distant from their estates had a similar impact, but on a larger scale. Proposition 3 both emphasizes the functional similarity of taxes and rents, and directs attention to the competition between them. In order to understand the Roman political economy, we have to take into account the balance between public and private exactions, between taxes and rents. Since production could not easily be increased, taxes and rents competed for a limited surplus. I shall argue tentatively that taxes were kept quite low with the result that private exactions could be correspondingly high. But my main argument is that the impact of money taxes and rents, spent away from the area in which they were raised, was similar in that they contributed to the monetization and commercialization of the Roman economy and to the urbanization of the Roman empire.

Proposition 4: the growth of trade 200 B.C.–A.D. 200

I have outlined my main arguments. In the rest of this paper, I shall argue four supplementary propositions, which support those already advanced. The fourth proposition is that there was a very considerable rise in inter-regional trade in the period 200 B.C.–A.D. 200. This is corroborated by the greater incidence from this period of ships wrecked and recently discovered by underwater archaeologists. Dr. A. J. Parker has collected information on 545 dated sea wrecks, mostly from near the coasts of Italy, France and Spain, where under-water archaeology is most developed.[15] The evidence therefore relates predominantly to the western Mediterranean. There is no sorting by size or type of ship (warship, merchantship); the dating is often crude, so the periods are correspondingly long. The results are indeed striking (see Figure 1), if we can consider discovered shipwrecks as a reasonable index of ship-sailings. Given the large number of finds, this procedure seems reasonable; for example, such evidence surely provides a better basis for generalization than would statements on this topic, and on this time scale, in a literary source. And besides, it seems likely that the average size of merchantships engaged in long-distance trade increased to reach a peak in the High Empire.[16]

Let us take a closer look at Figure 1. There was a very steep rise in dated wrecks found from the period 200 B.C.–A.D. 200. The number of dated wrecks found from the last two centuries B.C. is three times greater than in the previous two centuries. Surprisingly, it is also higher than the number found from the first two centuries A.D. But the difference is absolutely and relatively small; it does not form part of a trend; the last two centuries were more marked by piracy and warfare than the later period; the difference may be due to chance; data do not always work out exactly as one would like. All these factors taken together persuade me to ignore the difference between the figures for the last two centuries B.C. and the first two centuries A.D. But it is surely significant that the number of dated wrecks found from the first two centuries A.D. is almost twice as high as from A.D. 200–400. The Late Empire witnessed a significant downturn in trade, deeper in the third century A.D. (as it seems from a sub-sample of the evidence) than in the fourth century A.D.[17]

Such evidence merely confirms what was commonly believed, but it gives an additional, quantitative dimension to accepted beliefs. The dated shipwrecks show that in the period

[15] A. J. Parker, 'Ancient Shipwrecks in the Mediterranean and the Roman Provinces', *British Archaeological Reports, Supplementary Series* (forthcoming) (1980); cf. *Progress in Underwater Technology* 4 (1979). I am most grateful to Dr. Parker for letting me know about his important findings before their publication.

[16] See now P. Pomey and A. Tchernia, 'Le tonnage maximum des navires de commerce romains', *Archaeonautica* 2 (1978), 233 ff., who show that there is now sufficient archaeological and legal evidence (*D.* 50. 5. 3) to indicate that ships of about 400 tonnes burden and over were commonly used from the last century B.C., a tonnage not reached again until the fifteenth century by Genoa and Venice. I am assuming that average size was influenced by the construction of these large ships, but no direct evidence on average size exists, *pace* L. Casson, *Ships and Seamanship in the Ancient World* (1971), 183 ff., who relies too heavily on *IG* XII, Suppl. 348, which has been doubtfully restored in the critical passage—cf. *BCH* 57 (1933), 394 ff.

[17] See Parker, op. cit. (n. 15). The unfortunately long time-periods used in Figure 1 reflect the crudity of dating available. Still, more intervals would create more problems at the boundaries. I imagine there may have been significant variations within each long period. It has been suggested to me that more ships sank in the central period because of the Roman penchant for transporting heavy loads—marble, amphorae—by ship. It may be so, but this argument also illustrates scholarly ingenuity when confronted with a plausible generalization.

of Roman imperial expansion and in the High Empire (200 B.C.–A.D. 200), there was more sea-borne trade in the Mediterranean than ever before, and more than there was for the next thousand years.

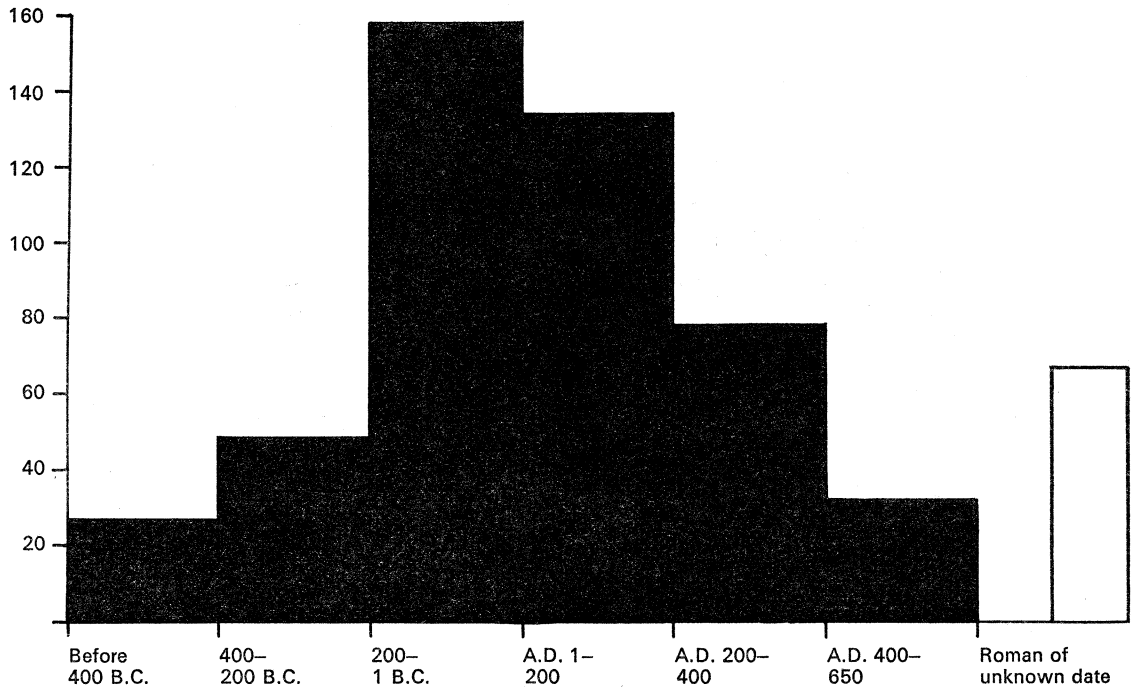

FIG. 1. NUMBER OF DATED ANCIENT SHIPWRECKS IN MEDITERRANEAN WATERS. See n. 15 for source.

Proposition 5: the growth of the money supply

An increase in the volume of inter-regional trade depended upon an increase in the volume of money to finance it. Merchants and their customers needed money in order to buy what was traded. In the modern world, most trade is financed by credit. We know almost nothing of credit in the Roman world; that does not mean that credit played a negligible role in Roman trade, but rather that we cannot estimate its importance. In any case, it is clear that money, predominantly silver coins, was the most important element in financing long-distance trade in the Roman world. Proposition 5 states that the supply of Roman silver coins increased enormously, perhaps tenfold, during a single century of the late Republic (157–50 B.C.). Proposition 4 and proposition 5 thus support each other. Once again, I suspect that this estimate of the growth in the money supply at Rome simply corroborates what is commonly believed by present-day Roman historians, but the method of measurement is novel. Since I am not a numismatist, the arguments may need some corrections.

The evidence which I shall now present is drawn exclusively from Michael Crawford's *catalogue raisonné*, *Roman Republican Coinage*. His data tell us the amount of silver coins issued in Rome each year in the period 157–50 B.C., since coin issues can be distinguished by the types (obverse and reverse) used. The chronological sequence of individual dies (roughly 30,000 obverse dies from this period) is our single best guide to the volume of coinage in circulation.

Modern experiments with ancient techniques for producing coins and estimates of the number of new coins needed for specific purposes in some few years suggest a normal minimum of 30,000 coins struck per obverse die.[18] The acceptance of this minimum

[18] M. H. Crawford, *Roman Republican Coinage* (1974), 694. The evidence supporting the conclusion that 30,000 coins were struck per die, normally, is impressionistic and plausible, but by no means certain. See contra, H. B. Mattingly, 'Coinage and the Roman State', *Numismatic Chronicle* 17 (1977), 206 ff., arguing for 15,000 *denarii* struck per obverse die and for lower military costs. In my judgement, Crawford wins the argument, on points (but see n. 29).

This content downloaded from 128.83.63.20 on Sat, 31 Aug 2013 08:09:09 AM
All use subject to JSTOR Terms and Conditions

estimate (30,000 coins per die) as the average output of all dies is obviously risky. First, the estimate itself is not certain; secondly, we do not know by how much some dies outlasted this minimum; thirdly, we do not know whether some dies were discarded, because of breakage or because of a change in the officials responsible for minting or for any other reason, before this minimum had been reached. Tentatively, I have accepted Crawford's estimate of 30,000 coins minted on average per die as the single best estimate.

However, it is worth stressing that the credibility of Figure 2 in no way depends upon the acceptance of this average number. Providing we accept that the average number of coins struck per die was roughly stable throughout the period 157–50 B.C., then we can regard Figure 2 as being drawn on a ratio scale, with the exact values on the vertical axis unknown. It is enough to say that, in this period, the volume of Roman silver coinage in circulation rose over tenfold.

But I have jumped the gun. Acceptance of this growth in money supply and in the monetization of the Roman economy depends upon two further questionable assumptions: the rate of loss and the initial stock in 157 B.C. We know nothing for certain about the rate at which silver coins were lost. That losses were substantial can be gauged from the volume of survivals in modern museums. Individual coins were lost accidentally; other coins were buried in hoards and then for some reason or another were not recovered. Cargoes including coins were lost at sea. Roman coins of this period were almost pure silver, so that they suffered considerably from wear. But their purity also restricted the benefits of reminting, the cost of which fell upon the mint.[19]

Figure 2 is based upon a constant loss rate of 2 per cent per year. Tentatively, I have taken this figure as the single best estimate available. It is derived, incongruously, from Patterson's analysis of loss rates of American silver coins in the forty years before 1962; for that period we have accurate data on the size of coin issues and the number of coins recalled and in circulation. The loss rate was 3 per cent per year (more for smaller value coins, less for higher value coins). The differences between the functions of coinage in the USA recently and in Rome two thousand years ago are too obvious to recount. A loss rate of 2 per cent per year was simply Patterson's best guess about ancient losses in the absence of any obviously reliable ancient evidence.[20] On this point, sophisticated analysis of several ancient coin hoards might help us estimate rates of loss, but we always should bear in mind that the composition of single hoards may reflect many factors besides the random availability of coins in the total economy. I should stress that assuming a constant rate of loss is a heuristic device, not a description of reality. In reality, loss rates must have varied considerably, depending for example on the rate of hoarding, the rate at which hoards were recovered and spent, the rate of reminting. The 2 per cent annual loss rate (amounting to a large mass of silver) is simply an attempt to average out these variations. Patterson's main point, and it seems to me convincing, was that the stock of silver diminished sensibly each year, except in so far as it was replenished by fresh production. Alternative rates of loss, 1 per cent or 3 per cent per year, even of 5 per cent per year, do not radically change the shape of the growth curve in Figure 2.[21] On any reasonable assumption, it seems clear that between 157 and 50 B.C. the money supply at Rome grew substantially, perhaps tenfold.

The second questionable assumption is the stock of silver coins in circulation in Rome at the beginning of the period in 157 B.C. The problem is that we do not know how many silver coins were minted before 157 B.C. For the purpose of Figure 2, I made arbitrary estimates after consultation with Michael Crawford, by the simple process of

[19] Why would the Roman mint systematically take in partly worn old coins, of almost pure silver, and remint to heavier new coins of the same purity? By doing this, the mint would shoulder all the cost of wear and of reminting. The answer depends partly on the fiduciary element in the currency, on how far coins were valued above their silver content, and on the availability of silver bullion. According to Polybius (Strabo 3. 2. 10), the Roman state in the mid-second century B.C. received 25,000 *drachmae* per day from the silver mines at New Carthage, Spain, in which 40,000 men worked. This comes to *c.* 35 tonnes per year for 365 days.

[20] C. C. Patterson, 'Silver Stocks and Losses in Ancient and Modern Times', *Economic History Review* 25 (1972), 207–10.

[21] If we increase the rate of loss to 10 per cent per year, the overall rise in silver coin stock 157–77 B.C. is still fivefold; the rise during the second century becomes slower, but the fall in the money supply from 77 to 50 B.C. becomes dramatic—more than 50 per cent. Surely, it is too dramatic to be credible. So is the implied absolute loss of coins.

This content downloaded from 128.83.63.20 on Sat, 31 Aug 2013 08:09:09 AM
All use subject to JSTOR Terms and Conditions

splitting the difference between a high and a low estimate.[22] The result was a stock of silver coins worth 35 million *denarii* in 158 B.C. This may not be right, but it does not matter too much, since the importance of the initial stock diminishes. With a loss rate of 2 per cent per year, the initial stock (whatever its size) halves in thirty-five years. By 120 B.C., the initial stock of 35 million *denarii* accounted for less than one-tenth of the total money supply; reasonable variation of the initial stock does not change the shape of Figure 2.[23] In sum, Figure 2 is based on three or four assumptions: (*a*) *either* 30,000 coins were on average struck per (obverse) die, *or* the average number of coins struck per die was roughly stable throughout the period 157–50 B.C.; (*b*) the rate of loss was significant, and is here set tentatively at 2 per cent per year; (*c*) the initial stock of silver coins in 158 B.C. is tentatively set at 35 million *denarii*. The detailed figures, as I have tried to make clear, are insecure, but the general trend seems firm.

What are the implications of a tenfold increase in money supply? First, some qualifications. Bullion (uncoined silver and gold) is not taken into account; nor is bronze coin, but the relative value of bronze was low. Gold coins are included; their value has been expressed in terms of silver coin. The annual loss rate of 2 per cent is large enough to take account of some hoarding, but in some years, particularly in years of civil disorder and uncertainty, hoarding probably reached much higher levels than normal. Figure 2 may therefore exaggerate the amount of money in circulation. Finally, the Roman state had no monopoly of silver coinage. Even conquered states continued to mint silver coins. Indeed, in the eastern Mediterranean, few Roman silver coins are found in hoards deposited before the age of Sulla; that is remarkable and important for the interpretation of Figure 2.[24] It implies that we are dealing here with money supply only in Italy and in the western Mediterranean. Even so there are difficulties. The sphere of Roman influence widened in the period with which we are concerned. Africa and southern Gaul became Roman provinces. In Spain, large numbers of local silver coins continued to be minted until about 70 B.C.; then Spain used Roman coins.[25] In other words, some part of the growth in Roman silver coins was simply a replacement for the coinage of the conquered. It seems impossible to measure how much, but archaeological evidence suggests that the volume of pre- and post-conquest provincial coinage was much smaller than subsequent Roman Republican coinage.[26] Whatever the qualifications, there was a real increase in the money supply in the Republican period of imperial expansion in the western Mediterranean. The volume of new silver coinage was huge. In the peak period of minting, 119–80 B.C., an average production of 14 million *denarii* a year consumed over 50 tonnes of silver per year, roughly half the average level of silver imported from America into Europe in the sixteenth century.[27]

A steep rise in the money supply is likely to result in an increase in prices, unless there is at the same time a fall in the speed of circulation of money (V), or a rise in the quantity of goods produced (Q).

[22] Both the high and the low estimates were probably on the high side. The high estimate was based on the following assumptions:
200–158 B.C.: the equivalent of one million *denarii* p.a.
220–201 B.C.: the equivalent of two million *denarii* p.a.
240–221 B.C.: the equivalent of one million *denarii* p.a.
The low estimate was half these levels. A loss rate of 2 per cent per year was also assumed. The result was 46 million and 23 million *denarii* respectively for the stock of silver coins in circulation in 158 B.C. The guesswork in these crude calculations hardly needs stressing. Please note that Crawford had already underlined the low volume of silver coins minted in the decade before 157 B.C., op. cit. (n. 18), 625.

[23] If, for example, we began with a stock of 80 million *denarii* in 158 B.C. instead of 35 million *denarii*, again with a loss rate of 2 per cent per year, then the total silver coin stock still rises sixfold to its peak in 77 B.C., although the rate of growth in the second century B.C. is slower. The general trend remains similar.

[24] M. H. Crawford, *Roman Republican Coin Hoards* (1969).

[25] idem, 'The Financial Organization of Republican Spain', *Numismatic Chronicle* 9 (1969), 84.

[26] Compare, for example, the fifteen British coins found at Maiden Castle with the several hundred Roman coins found at Verulamium (R. E. M. Wheeler, *Maiden Castle* (1943), 329; *Verulamium* (1936), 223 ff.). But are the sites comparable? In any such comparison there are some difficulties. And besides there were exceptions: some districts of Britain had come under Roman commercial influence before the conquest. Even so, in spite of the difficulties of illustrating it, the generalization still holds, I think.

[27] See G. Parker in C. M. Cipolla (ed.), *Economic History of Europe* (1974) II, 527–8; on the huge scale of Roman silver mining, see J. M. Blazquez, 'Explotaciones mineras en Hispania durante la República y el alto Imperio Romano', *Anuario de Historia económica y social* 2 (1969), 9–68; D. Avery, *Not on Queen Victoria's Birthday* (1974), 413 ff.; also Patterson, op. cit. (n. 20), 218 ff.; and Hopkins, op. cit. (n. 6), 56.

$$\text{Price}_{(P)} = \frac{\text{Money Supply}_{(M)} \times \text{Speed of Circulation}_{(V)}}{\text{Quantity of Goods (Q)}}$$

We have no evidence of a substantial rise in the price of goods; the argument from silence is notoriously dangerous. But surely, even our jejune sources might have noted a five- or tenfold increase in prices. It would be reasonable to argue that the speed at which money circulated (v) probably slowed down in this period, for three reasons: the state treasuries must have kept huge sums in reserve and even stored money as treasure; so too did private individuals and professional bankers; thirdly, the greater distance which separated tax-payers and tax-spenders left considerable amounts of cash idle in transit.[28] But above all,

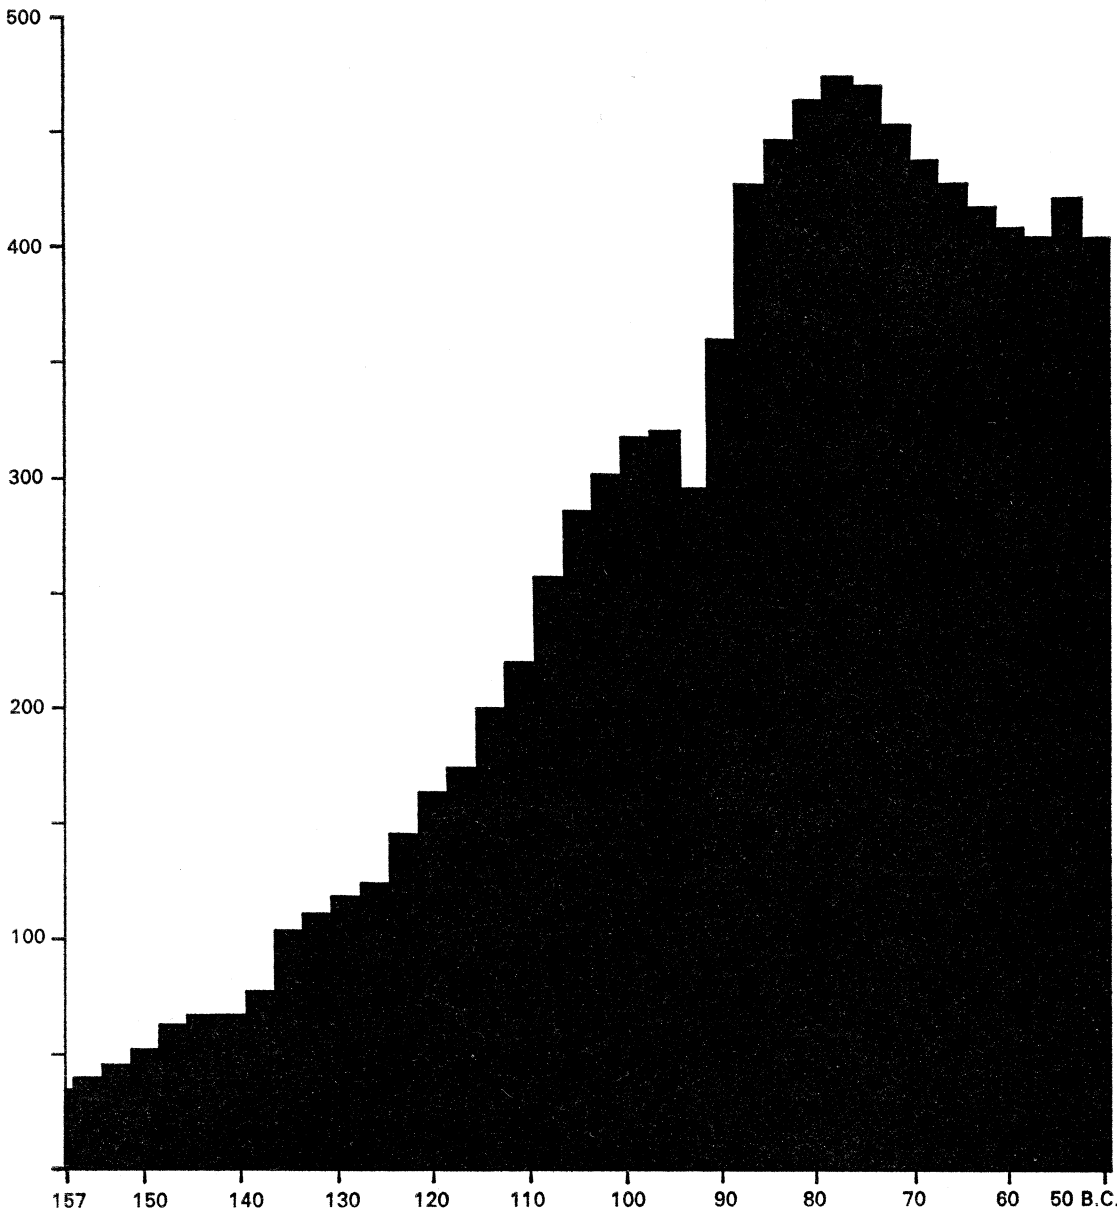

FIG. 2. ROMAN SILVER COINS IN CIRCULATION 157–50 B.C. (in millions of *denarii*, by three year periods.)

and this is the chief implication of the steep rise in money supply, it had little impact on prices, partly because of the substantial rise in the volume of trade in an expanded area, and partly because money percolated into a myriad of transactions which had previously been embedded in the subsistence economy. Both M and Q increased. For example, tens of thousands of peasants joined the army and received pay as soldiers, or migrated to the city of Rome where they consumed food and drink, clothing and shelter for which they paid money. The supply of money rose because more people were using it for more activities. Figure 2 captures that change in economic activity better than any literary source.

Up to now we have been concerned with the consequences of an increasing money supply for the Roman economic system, without considering the intentions of those who decided to mint more coins. Of course, it is possible that Roman senators, who decided each year how much money should be minted, were in detail and in gross ignorant about the economic implications of their separate decisions and of their cumulative impact. But Crawford has argued that the volume of coins minted was primarily determined by the volume of military expenditure; he postulated a ' remarkable correlation between (military) expenditure and the volume of coinage '.[29] This is *prima facie* plausible, as Figure 3, derived from Crawford's tabulation, shows. Fortunately, Crawford provides us with the data, money minted and army cost for the period 157–97 B.C., with which we can test his hypothesis.

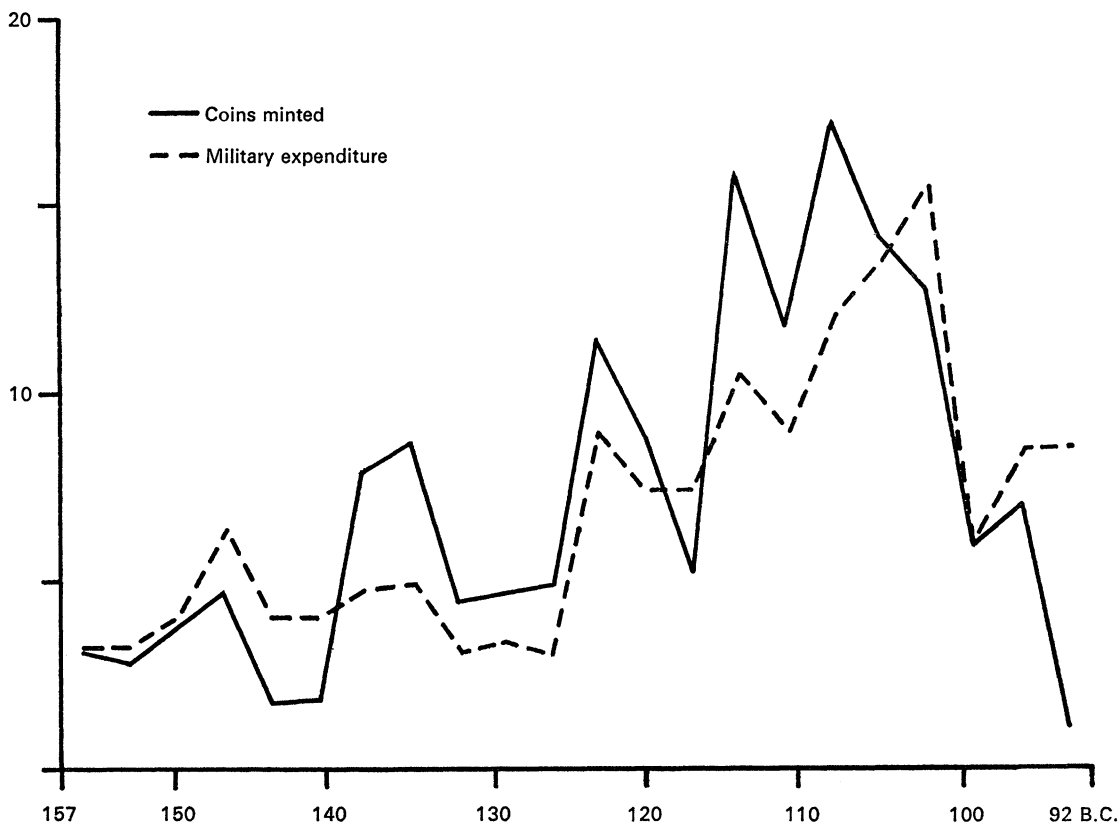

FIG. 3. COINS MINTED AND MILITARY EXPENDITURE 157–92 B.C. (in millions of *denarii*, annual averages of three year periods). Based on M. H. Crawford, *Roman Republican Coinage* (1974), 698 ff.

[29] Crawford, op. cit. (n. 18), 694, cf. 617 and 633. I cannot agree with Crawford's suggestion that soldiers were typically paid with new coin, even in the second century B.C., let alone that minting purposively matched state expenditure on the army. Many soldiers served too far away from the city of Rome to be supplied from there with new coin, and besides the annual mintage of new coins constituted only a small proportion of all the coins in circulation. Why pay in new coins only ?

Formally, a correlation can be defined as a measure (from 0 low to 1·0 high) of the extent to which a factor X co-varies with or predicts a factor Y (such as body weight and height, education and income). The correlation between volume of silver coinage minted and military expenditure between 157 and 97 B.C. works out at ·88. It is so high that it is suspect. At this level, military expenditure purportedly explains over 75 per cent of the variance (variance explained is the correlation coefficient squared) in the volume of silver coins minted. One problem with such correlations is that they do not take time sequence into account; the paired observation (X and Y) could be rearranged at will; the correlation would stay the same. Moreover, co-variation could be the result of other unnamed factors. For example, coinage and military expenditure may both have increased in the same period because of imperial expansion; imperial expansion would then be the explanation of both, rather than one being the explanation of the other.

But the real problem is that the simple correlation of silver coins minted and military expenditure is not the best test of Crawford's proposition. In strict logic, his proposition implies that a change in military expenditure brought about a change in the number of coins minted.[30] We can test that hypothesis by correlating the inter-annual percentage change in military expenditure with the inter-annual percentage change in the number of coins minted. Such a test is demanding; the resulting correlation works out at ·32. The result is still significant, but the correlation is much lower than the first correlation, and explains only 9 per cent of the variance in the volume of silver coins minted. The field is left open for other explanatory factors. I do not know what they are.

At this stage, I should like to make only two brief points. First, in some years very large mintages were associated with heavy military expenditure (91–89 B.C. are obvious examples; but what about 110 and 108 B.C. ?). These exceptionally large mintages had long-term repercussions on the money supply; the large number of coins minted in an emergency stayed in circulation for a long time. In that sense military expenditure was a very important determinant of the volume of silver coins minted. Secondly, the overall pattern was one of steady growth in money supply, as though the senators and their advisers (note Plutarch, *Cato the Younger* 16) had some general idea of the need for money independently of each year's state needs. And besides, as one can see from Figure 2, by 100 B.C. the volume of coins in circulation was so large that fluctuations in the supply of new coins in a single year may not have had a significant impact on economic activity. There were two processes at work: large inter-annual fluctuations and a general trend. I wish I knew how they were related.

I would have more confidence in the idea that the Roman senate knew something of what it was doing, when it ordered how much silver money was to be minted, but for one significant occurrence. Between 75 and 50 B.C., there was a considerable drop in the number of silver coins minted and circulating. For example, the average number of silver coins minted 73–59 B.C. (at about 4 million *denarii* per year) was less than a third of the level of the previous fifteen years. There may have been problems in the supply of new silver from Spain, but no source says so. The drop in the total number of coins circulating was of the order of 15 per cent between 75 and 50 B.C., somewhat more if hoarding reduced the annual loss to more than the 2 per cent annual loss assumed.[31] This drop in the total of coins circulating may not seem serious. But the range of activities funded by silver money in the western Mediterranean continued to expand in these years; Roman coins were beginning to be used in the eastern Mediterranean basin also; and some provincial issues, for example Spanish coins, were no longer being minted. Roman silver coins had to take their place. Therefore, the demand for silver coins was increasing at the very same time that supply was falling.

[30] To be fair, Crawford did not strictly make a proposition; he just drew a conclusion, and expressed it sufficiently clearly so that it could be tested. If he had proposed a general relationship between military expenditure and minting which took time to show, then we could have done a lagged correlation: military expenditure in years 1, 2, 3 with minting in years 2, 3, 4, etc. But that is not what he suggested.

[31] M. H. Crawford, ' Coin Hoards and the Pattern of Violence in the Late Republic ', *PBSR* 24 (1969), 79, shows a high frequency of unrecovered hoards in Italy between 75 and 71 B.C., but a low frequency 70–50 B.C. The evidence is suggestive only. I have suggested (n. 21) that the constant loss rate was very probably less than 10 per cent.

Theoretically, the consequences of a down-turn in money supply should be a shortage of money, a crisis in liquidity, a shortage of credit, a rise in interest rates and falling prices. Interestingly enough, we find several of these phenomena attested in 49 B.C., in what several scholars have called 'a crisis of credit'.[32] Cicero wrote about the 'shortage of money' (*Letters to Atticus* 9. 9); Caesar stated that 'credit throughout Italy was tighter and debts were not being repaid' (*Civil War* 3. 1). I am not claiming that a fall in the money supply alone brought about the crisis of 49 B.C. But the down-turn in money supply seems to have been an important factor contributing to recurrent domestic crises in Italy during the sixties and fifties B.C., which political historians have not known about.

Proposition 6: the integration of the monetary economy in the High Empire

At the beginning of this paper, I proposed a model of the Roman economy, in which the imposition of money taxes and of money rents, and their expenditure at a distance from their source, contributed to the gradual creation of complex networks of trade. The flows of money taxes, of trade and of money rents contributed to the integration of the economy of the whole empire. Proposition 6 states that, in the first two centuries A.D., the monetary economy of the Roman empire became integrated into a single system. In the last two sections, I have proposed that there was a huge growth in long-distance sea-borne trade in the western Mediterranean in the period 200 B.C.–A.D. 200, and a huge growth in the supply of Roman silver coins in the period 157–50 B.C., again principally in the western Mediterranean. Evidence on money supply during the first two centuries A.D. does not allow a similar analysis. The sheer volume of Roman imperial coinage has prevented anyone from counting the number of known silver coin types, let alone dies. And besides, progressive debasement from the middle of the first century A.D. onwards must have encouraged massive re-use of old coins to mint a larger number of new, debased coins. Estimates of loss rates are therefore extremely problematic, and guessing the total amount of silver coin in circulation would, I think, be unhelpful. We must try another tack.

Perhaps I can best begin by proposing for the sake of argument a counter-hypothesis: the Roman monetary economy was so primitive and localized that state expenditure in one region had no impact in other regions. Money simply piled up and circulated locally.[33] We then face two problems: first, how did inner-core provinces get silver coins with which to trade and pay taxes? As far as we know, the Roman state had no mechanism for distributing coin, other than by state expenditure. Secondly, did heavy expenditure by an emperor in one area, for example by Marcus Aurelius in the Danubian region during his long campaigns there, leave traces in a disproportionately large deposit of his coins? The evidence which I am going to discuss was not designed to test this counter-hypothesis or proposition 6.[34] But I think it suggests that proposition 6 is correct and that the counter-hypothesis is wrong.

Figure 4 indicates that the whole Roman empire was integrated into a single monetary economy. At least, that is my interpretation. All the lines of the Figure go up, then down, then up and along together. The very fact that it is difficult to distinguish the lines in the Figure from each other supports my argument. Let me elaborate. Figure 4 is based on the analysis of over 90,000 silver coins found in five regions of the Roman empire: southern Germany, northern Italy, Britain and Gaul, the Balkans and a garrison town in Syria. These regions were chosen arbitrarily, because there were easily accessible catalogues or

[32] cf. M. W. Frederiksen, 'Caesar, Cicero and the problem of debt', *JRS* 56 (1966), 131 ff.; cf. M. H. Crawford, 'Money and Exchange in the Roman World', *JRS* 60 (1970), 46; see also Cicero, *Letters to Atticus* 7. 18.

[33] To some extent, this must have happened. And as a result, migrant labourers were attracted to places with high levels of expenditure, such as frontier garrisons (hence the urban development there) and to the city of Rome.

[34] I started by re-analysing Dr. Richard Reece's data, published in 'Roman Coinage in the western Empire', *Britannia* 4 (1973), 227 ff. I am most grateful to him for discussing his data with me, and particularly for reworking his data from northern Italy for the period A.D. 69–96 into two sub-periods, 69–81, 81–96. The patterns which emerged enticed me to see what I would find from other regions or coin collections.

analyses of coins found there.[35] Each line of the Figure represents the coins found in a particular region (where applicable, by type of find—but more of that in a moment). Figure 4 shows that, for roughly a hundred and fifty years (A.D. 50–200), increases and decreases in the volume of coins, minted by each emperor, were similarly reflected in different and widely separate regions of the empire. Apparently an effective mechanism for distributing silver coins throughout the empire existed, so that several regions (and if these, then surely others also) got roughly the same ratio of coins stamped, for example, with the head of Trajan compared with coins stamped with the head of Domitian. What was this mechanism? We know that state expenditure was concentrated in the city of

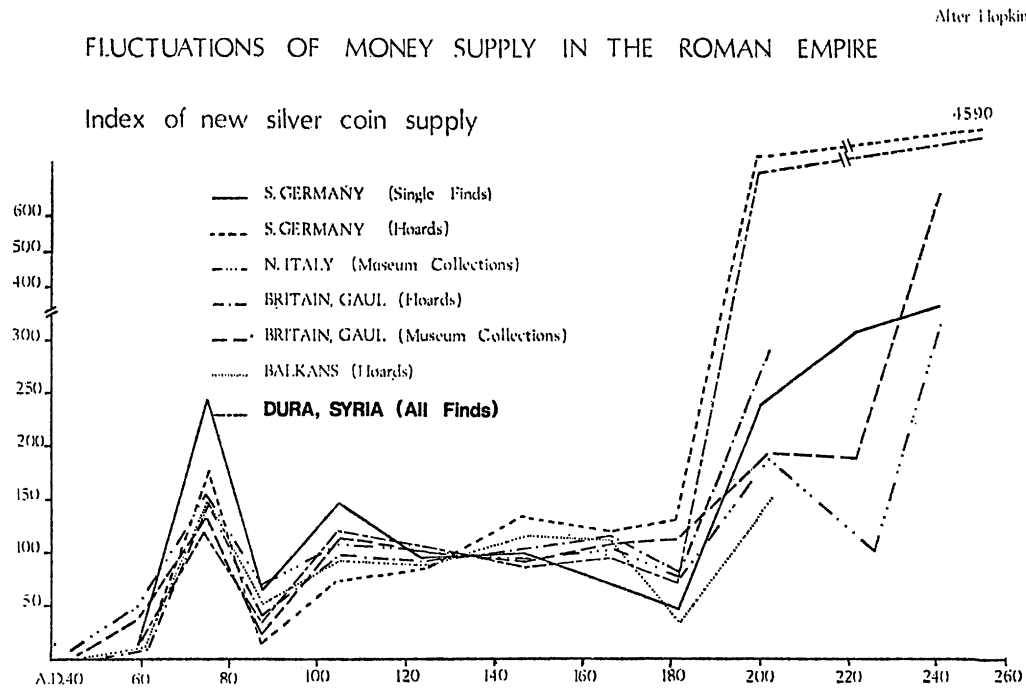

FIG. 4. FLUCTUATIONS IN THE NUMBERS OF SILVER COINS FOUND, BY DATE OF MINTING AND BY REGION OF FIND.

Rome and on the frontiers. I suggest that it was the flow of money taxes and of tax-stimulated trade which redistributed state-issued silver coins throughout the empire. I cannot prove that this answer is correct. But Figure 4 poses a problem which deserves an answer.

Let me now go into the details of Figure 4's construction. The horizontal axis is divided into reigns of emperors, rather than uniform time periods, because coins are easily

[35] In addition to Reece's data, I used six volumes of H. Gebhart and K. Kraft (edd.), *Die Fundmünzen der römischen Zeit in Deutschland* (1961–): Saar, Pfalz, Süd-Baden, Süd-Württemberg, Schwaben, Oberbayern, i.e. a band of adjacent districts in southern Germany. For hoards in the Balkans and in Britain, Gaul and Germany, I used S. Bolin, *State and Currency in the Roman Empire* (1958), appendices; from this collection, I arbitrarily excluded from consideration one enormous Bulgarian hoard of more than 60,000 silver coins, which overwhelmed the other finds, and which seemed different in character from the other hoards. Finally, I used A. R. Bellinger, *The Excavations at Dura-Europus, Final Report* VI, *The Coins* (1949). I should note that the museum collections from Britain, northern Gaul (including some from northern Germany) and southern Gaul cover a large area. I checked before compression of the districts, separately analysed by Reece, to make sure that the patterns being compressed were roughly similar, so that the single line drawn from the collections in Figure 4 reasonably reflects the individual components.

and conventionally identified by the emperor's head stamped on each.[36] One then has to divide the number of coins found per reign from each region by the length of the reign, to get a standardized index: coins found per year. The first draft of the Figure was based on such raw numbers and it showed what one might have expected (or known), that northern Italy was more monetized than southern Gaul, which in turn was more monetized than northern Gaul . . ., if one can use relative volume of found coins as an index of monetization. I then faced two problems, one tactical, one interpretative: first, the differences in the raw numbers were so great that it was difficult to put the evidence in a single Figure; secondly, there were more coins found in the Balkans than elsewhere, which was, I suspected, a function more of archaeological activity and the discovery of unrecovered hoards, than of relative monetization. I therefore decided to concentrate not on relative quantities of coins by regions, but on relative quantities of coins by time of minting, in each region and between regions.

For this purpose, the vertical axis of the graph was converted to a ratio scale, based on an index number 100, like a modern consumer prices index or a wage index. For each region, the base index number, 100, represents the average number of coins found per year of the period A.D. 96–180. This period was chosen because it was the most stable period of the Roman imperial economy. We can call this base (100) a second-century index number. The average number of coins per year in each reign (or regnal period) was then expressed as a ratio of this second-century index number.[37] Thus each line for each region is drawn by expressing the average number of coins per year from each reign as a ratio of the average number of coins per year from the central index period. What is amazing about Figure 4 is that data of such varied provenance and composition show such similarities in pattern.

Provenance is a problem which deserves further discussion. In Figure 4, I have drawn some separate lines for singly-found coins, hoards and museum collections. Most silver coins are found in hoards; some silver coins are found singly, dropped by chance in street or home. Many coins are now in modern museum collections with their exact provenance unknown. Although we can make precise, if arbitrary distinctions between these categories, we cannot assign all coins with certainty to one category. Provenance matters, particularly because the composition and the incidence of hoards may seriously bias our evidence; fears on this score have hindered the exploitation of coin evidence by ancient economic historians.

The composition of hoards may have been biased because hoards were compiled, sometimes by several collectors, over long periods during which hoarders tended to hoard the better, i.e. the purer, coins and to spend the worse, debased ones. Thus hoards may not correctly represent the coins in people's purses. Secondly, it is well known that the incidence of hoarding is heavily affected by general economic and political conditions. In times of political insecurity, more hoards are stowed away, or more accurately, more hoards are not recovered by hoarders. After all, what we dig up are, rather sadly, hoarders' unrecovered savings. Their loss is our gain. Thus there are many coins now surviving from the third century A.D., partly because many hoards were not recovered in that period. Paradoxically, and it is a sobering thought, we may have more coins from the very period in which most coins were withdrawn from circulation.

Luckily, we have a check on these speculations: several thousand singly-found silver coins, carefully documented as such in the voluminous catalogue of coin finds in Germany (see n. 35). It is critically important for the conclusions advanced here that the line drawn from singly-found coins from southern Germany is similar in shape to the other lines based on hoards or museum collections, both in southern Germany and elsewhere. The singly-found coins, casually dropped or lost, do represent what was in people's purses.

[36] In fact, following Reece, I collapsed short reigns with adjacent longer reigns (for example, Titus with Vespasian, Nerva with Trajan) to form convenient regnal periods.

[37] For example, there were 3,812 singly-found silver coins listed in the six volumes of German coin finds, which I analysed. Incidentally, this was by far the smallest number of coins used for any line in Figure 4. The average number of coins per year in the period A.D. 96–180 was 5·3; 5·3 is the second-century index number (100) for south German singly-found coins. For the reign of Hadrian, the average number of coins per year was 4·9 which is 92 per cent of the second-century index number, and so on.

They represent coins in current use. The striking similarity in the patterns presented in Figure 4 encouraged me to use the evidence from hoards also.

Let us take a final look at Figure 4. The general impression, as I have already noted, is that all the lines follow roughly the same path. In the reigns of Vespasian and Titus (A.D. 69–81), there was a huge rise in the volume of silver coins minted, then during the reign of Domitian (A.D. 81–96) there was a considerable fall. During the reigns of Nerva and Trajan (A.D. 96–117) the volume of coins minted rose again significantly, but then levelled out again throughout most of the second century A.D. This was a period of economic stability; by some accounts, it was also a period of widespread prosperity. During the reign of Commodus (A.D. 180–92), five out of the seven lines in Figure 4 fell, but then during the reign of Septimius Severus (A.D. 193–211) most lines rose steeply. After that there was confusion; indeed, the lines for southern Germany should be drawn to a completely different scale; and the other lines show no similarity of pattern.[38] The unity of the monetary economy had broken down.

Let me stress again the considerable difference between Figure 2 and Figure 4. Figure 2 estimated the accumulated volume of silver coins in circulation, deduced from the total number of dies ever used. Figure 4 shows the number of silver coins found in each province, by date of minting (expressed as a ratio of the number of coins found per year in the period A.D. 96–180). Figure 4 indicates that there were some very large leaps in new coin supply, for example, at the beginning of the third century A.D., which would have had implications for total money supply. But the transformation of the graph into a picture of the accumulated volume of coins in circulation is beset with overwhelming difficulties.[39]

That said, the end of Figure 4 is of considerable interest. It implies that new money supply from about A.D. 200 rose, as silver coins were progressively debased. Prices presumably rose, since it seems improbable, even impossible, for a pre-industrial economy to have absorbed such large and sudden increases in valuable coinage without corresponding price increases.[40] Our documentary evidence on this point is inadequate; we can prove price rises only much later. But from the analysis of dated shipwrecks (Figure 1), we have deduced that trade in the third century A.D. declined. From western archaeological evidence, we can also argue that some towns also declined in the third century.[41] The central govern-

[38] *Denarii* and so-called *antoniniani* have been treated equally as silver coins. If we had taken account of the face value of *antoniniani* (at two *denarii*), which were minted in large quantities only after A.D. 238, then the lines at the right end of Figure 4 would have been higher than shown.

[39] In addition to the problems of debasement, of reminting old coins and of loss-rates, which I have already mentioned, coin volume in the High Empire is complicated by the operation of several mints in the eastern Mediterranean. Thanks now to the painstaking and impressive work of D. R. Walker, *The Metrology of the Roman Silver Coinage* I–III, *British Archaeological Reports, Supplementary Series* 5, 22, 40 (1976–8), we can see how Roman provincial mints (for example, in Syria, Asia Minor and Crete) reflected a central Roman monetary policy. The evidence for this central control (which was directive, not reactive) is that the weight and fineness of provincial silver coins were reduced roughly to the same extent as, and sometimes before, silver coins minted in the city of Rome. This co-ordination of imperial monetary policy has important historical implications. But it was imperfect, so that measurement is difficult.

[40] The problem is complicated. Figure 4 implies that the volume of debased silver coins rose considerably after A.D. 193 and that the increase in the volume of coins minted outstripped the rate of debasement. For example, I reckon from Walker's data (see previous note) that the median weight of silver in *denarii* minted in the city of Rome fell by 43 per cent at most, between A.D. 180/9 and 211/17 (2·29 g of silver in 180/9, 1·85 g in 196/211, and 1·31 g equivalent in the debased *antoniniani* minted at the end of Caracalla's reign (face value 2 *denarii*)). But the proportionate increase in the number of coins found is visibly greater than 43 per cent (see Figure 4). Such an increase in money supply might initially have stimulated commerce and production; but the increase in coins was too rapid not to have increased prices also. And in due course there was a downturn in trade; I am not claiming that increased money supply and price rises were alone responsible for the downturn in trade in the third century. Some of these issues are excellently discussed by M. Corbier, 'Dévaluations et fiscalité (161–235)', in *Les dévaluations à Rome, Collection de l'école française de Rome* 37 (1978), 273 ff.; I disagree with Corbier in important detail, while admiring her work in general.

[41] The most obvious index of urban decline is the widespread drop during the third century A.D. in the number of datable inscribed stones, commemorating the erection of new buildings, charitable foundations, statues, gifts, manumissions and deaths. See, for example, the statistical analysis of some evidence by R. P. Duncan-Jones, *The Economy of the Roman Empire* (1974), 352, and B. Laum, *Stiftungen in der griechischen und römischen Welt* (1914). Changes in the fashion for inscribing and giving may account for some of this drop, but surely not for all of it. Yet how sensitive are such inscriptions as an index of prosperity, and of whose prosperity? For other illustrative evidence of urban decline see, for example, P.-M. Duval, *Paris antique* (1961), 277, and, for a fourth-century revival, E. Patlagean, *Pauvreté économique et pauvreté sociale à Byzance* (1977), 232. I cite these isolated illustrations in the absence, as far as I know, of synoptic archaeological reviews.

ment increasingly resorted to taxation in kind and paid its troops and officials in wheat rations (*annona*, *capita*) instead of in money. This complex of changes provides a corollary to my initial propositions: the decline in the exaction of money taxes brought about a decline in trade. The corollary helps corroborate the basic propositions with which I started.

Proposition 7: taxes in the High Empire were low

In the last section, I adduced evidence to show that the monetary economy of the Roman empire was integrated into a single system. I proposed, although I could not prove, that taxation in money and the trade which it stimulated were important factors in ensuring the circulation of silver coins throughout the empire. In previous sections, I have proposed that sea-borne trade increased in the period 200 B.C.–A.D. 200, and that the volume of silver coinage minted at Rome and circulating in the western Mediterranean increased, perhaps tenfold, in the period 157–50 B.C. It seems likely, to judge by the volume of survivals, that the volume of silver coinage circulating in the High Empire was considerably larger than in the late Republic.[42] All these arguments, and the evidence from which they are derived, are partial, but they draw strength from their inter-relationship. They back each other up.[43]

In this section, I want to estimate the level of taxation in the High Empire and the importance of taxation in the Roman economy. This is clearly critical for the basic proposition that exacting taxes in money stimulated trade. Unfortunately, no exact evidence of general tax rates in the High Empire survives.[44] Some fragments of earlier evidence serve as a first check. According to a possible interpretation of Plutarch (*Pompey* 45), the Roman treasury's income in 62 B.C. was 340 million HS per year. To this we should add income from subsequent conquests, particularly in Gaul and in Egypt. Frank (*ESAR* v. 7) estimated total state revenue in the reign of Augustus at 450 million HS, with army expenditure at 275 million HS. Both these figures seem serious underestimates.[45] I reckon that an army of 300,000 men (half legionaries, half auxiliaries) cost over 400 million HS per year, once

[42] The silver coin types listed, by obverse and reverse types, in the several volumes of *Coins of the Roman Empire in the British Museum*, ed. H. Mattingly *et al.* (1923–) are a tenuous index of the volume of coins ever minted, since we do not know how many identical dies of the same type were used. But no one can reasonably doubt the increase in the volume of silver coins minted in the Principate. This absolute growth is important, but once it is divided by the size of the population (coins per head) it becomes less impressive.

[43] This is what I have called a wigwam argument, in which weak arguments prop each other up and circumscribe 'truth'; see my *Conquerors and Slaves* (1978), 20.

[44] See particularly A. H. M. Jones, *The Roman Economy*, ed. P. A. Brunt (1974), especially 161 ff.; J. Marquardt, *Römische Staatsverwaltung*[2] (1881) II is still useful. Much more has been written about taxation in the Late Empire; see particularly A. Déleage, *La capitation du Bas-Empire* (1945), and A. Cerati, *Caractère annonaire et assiette de l'impôt foncier au Bas-Empire* (1975). But lengthening a bibliography should not disguise our lack of solid information and of real understanding about Roman taxation. Some Romans knew the size of their own state expenditure. Appian (*Roman History*, Preface 15) promised that, in his last book, he would outline the size of Roman military forces, the revenues collected from each province, the cost of the navy, etc. Unfortunately, this book does not survive. Augustus, the first emperor, left a will in which he detailed 'the cost of the army, revenues, public expenditure, the amount of money in the treasuries . . .' (Dio 56. 33). The conjunction army, revenues, expenditure is suggestive.

[45] Revenues of the Roman State. The major problem in estimating Roman state revenues is the quality of the surviving evidence. The following six snippets have been trusted more than they deserve:

(*a*) Julius Caesar imposed a tribute on Gaul of 40 million HS (Suetonius, *Julius Caesar* 25);

(*b*) '(The Gauls) pay almost as much tribute into the treasury as the rest of the world' (Velleius Paterculus 2. 39);

(*c*) 'Augustus made Egypt tributary, thereby contributing nearly as much revenue to the treasury as (Caesar) had brought to it from Gaul' (ibid.);

(*d*) Herod Agrippa derived from Palestine 'as much revenue as possible, amounting to twelve million *drachmae*' [= *denarii*] per year (Josephus, *Jewish Antiquities* 19. 352);

(*e*) '. . . the tribute which (Egypt) yields to Rome in one month surpasses what you (in Palestine) pay in one year; besides money, (Egypt) sends wheat to feed Rome for months' (Josephus, *Jewish War* 2. 386);

(*f*) 'When the cost had reached seven million (*drachmae*), the procurators of Asia wrote to the emperor that it was a scandal for the tribute of five hundred cities [i.e. Asia] to be spent on one city . . .' (Philostratus, *Lives of the Sophists* 548).

There is not much more than this. Frank seeks to make (*a*) compatible with (*b*), and (*c*) compatible with (*d*) and (*e*), by claiming that they refer to different periods and that tax rates rose in Gaul and in Egypt between the beginning of the reign of Augustus and the middle of the first century A.D. But from 40 million HS to half the revenue of the empire in the case of Gaul? And from less than 40 million HS to more than 500 million HS (12 × 12 million *denarii*) in the case of Egypt? Yet Asia was reportedly paying less than 30 million HS in the second century A.D. (*f*)! That is absurd. See Frank, *ESAR* v, 7 and 51 and n. 49 below on the revenues of Egypt.

we include the cost of retirement bounties for veterans, and extra pay for privileged soldiers and officers. But there is a large element of uncertainty in any estimate, since we do not know how much auxiliaries were paid or how much the fleet cost.[46] Several ancient authors state that expenditure on the army constituted by far the largest item in the state budget.[47] That is an important observation. It seems intrinsically plausible, and is corroborated by the fact that soldiers, in spite of their political power and participation in civil wars, did not succeed in raising their pay (in terms of silver) above the Augustan level, except for a short period.[48] The state treasury could not afford to pay them much more.

Frank very tentatively estimated total state revenues in A.D. 70 at about 1,200–1,500 million HS; several components of this guess, such as the revenues from Egypt, seem exaggerated.[49] And if the total budget was as high as that, then the cost of the army (at 275 million HS by Frank's estimate, or more than 400 million HS by my estimate) was not the huge element in the state budget which our sources assumed. In sum, Frank's first estimate of the state budget at 450 million HS was too low; but his estimate for A.D. 70 at 1,200–1,500 million HS was too high.

In these circumstances, I thought it would be worthwhile to try a different, somewhat experimental method of overcoming the shortage of direct evidence. Let us deal with relationships between probabilities, rather than with the well-documented 'facts' which are the normal building bricks of conventional history. We can move later from abstract to concrete. In the following discussion, three principles apply. First, the range of probability is finite; for example, scholarly estimates of the probable population of the Roman empire at its peak range only between 50 and 120 million.[50] Secondly, the choice of a value for one variable limits the range of probability for cognate variables; for example, the larger we set the size of the tax-paying population, the lower the amount of tax paid by each, if we also think that the Roman government faced difficulty in paying its soldiers. Put another way, and this is my third point, not only do our choices constrain each other, but the final results must also be compatible with whatever else we want to believe.

Tax can be conceived as a proportion of gross product. Can we estimate the gross product of the Roman empire? At first sight, it seems hopeless. But we can make a

[46] It is impracticable to calculate the total cost of the Roman army thoroughly in a footnote. It is a reflection on scholarly concern with detail, rather than with broad problems, that I can cite no standard estimates of how much the Roman army cost. My tentative conclusion is that the total cost of the Roman army at the beginning of the first century A.D. was 415 million HS, plus or minus 50 million HS. See Appendix I for details.

[47] 'Our present revenues are insufficient to provide for the army and everything else', wrote Cassius Dio (52. 6) in a speech which he attributed to Agrippa in 29 B.C. Another writer (SHA, *Probus* 23) envisaged a dream world in which there would be no soldiers and therefore no tax on land. The jurist Ulpian explained that tax (*tributum*) was what was *attributed* to soldiers (*D.* 50. 16. 27: 'sane appellatur ... tributum ... ex eo quod militibus tribuatur'). The sixth-century anonymous author of *Practical Politics* wrote that 'expenditure on the army is the biggest item of state expenditure each year', *Griechische Kriegschriftsteller*, edd. H. Köchly and W. Rüstow (Leipzig, 1855) II.2, 47. None of these sources is earlier than the third century A.D.; indeed their citation may not be convincing. Yet it seems likely that their statements were broadly true, and that the cost of the army dominated the state budget during the High Empire also.

[48] This calculation involves multiplying legionary pay by the average weight of, and by the proportion of silver in, coins minted in the city of Rome under each emperor. According to this calculation, legionary pay was for long periods under the Augustan level, and rose by more than 10 per cent above the Augustan level only briefly, in the reign of Caracalla. See G. R. Watson, *The Roman Soldier* (1969), 91 on soldiers' pay, and D. R. Walker, op. cit. (n. 39), for the weight and silver content of coins. To be sure, in so far as coinage was fiduciary, i.e. in so far as its worth did not depend upon its silver content, such a calculation tells us little. I am willing to believe that in small-scale transactions, the silver currency was substantially fiduciary (since testing coins for exact silver content would have been difficult), but, in gross, I imagine that prices were influenced by the increases in money supply which followed debasement.

[49] On the basis of two snippets from Josephus, quoted in n. 45 (*d*) and (*e*) above, Frank (*ESAR* V, 52) concluded that Egypt yielded 576 million HS plus 20 million *modii* of wheat (at say 3 HS per *modius* = 636 million HS total). The population of Roman Egypt is conventionally regarded as above seven million (Finley, *The Ancient Economy* (1973), 97); in K. J. Beloch's view (and I agree completely) that is far too high (*Die Bevölkerung der griechisch-römischen Welt* (1886), 258 and 507: 5 million); even Beloch's estimate is generous. Seven million people would have been paying 200 kg wheat equivalent per person in tax to yield Frank's estimated total. That is again much too high: the claimed total is five times higher in wheat terms than the total tax levied in Egypt by the Ottomans in the seventeenth century (see S. B. Shaw, *The Financial and Administrative Organization and Development of Ottoman Egypt* (1962), 79, 84 and 183. Cf. the implied tax rate in the fourth century A.D. (*P. Oxy.* 3307) which was much lower, and n. 56 below.

[50] J. C. Russell, 'Late Ancient and Medieval Population', *Transactions of the American Philosophical Society* 48. 3 (1958), 7, for literature and for a full discussion of the evidence, and see n. 52 below.

minimum estimate by multiplying the size of the population by the amount of food necessary to keep that population at the minimum level of subsistence. Let us follow the convention of modern agricultural economists and translate consumption needs into terms of basic grain (kg wheat equivalent). In this way, we can easily take account not merely of food, but also of minimum needs for clothing, heat and housing.[51] Obviously, such a calculation poses problems; needs for food depend on climate, age, sex, body weight, height and energy expended. An average of 250 kg wheat equivalent per person/year is low, low enough to take account of the probable age composition of a population suffering high mortality and suffering from recurrent feelings of hunger. Adult males would, normally, have consumed significantly more than this average; children and old people significantly less. Let me stress that the measure is in terms of wheat *equivalent*. It does not mean that people ate only, or indeed any wheat. Wheat equivalent is merely a currency of cross-cultural comparison, such that all consumption is expressed in terms of wheat. Incidentally, one advantage of this convention is that it gives us a key for translating the meaning of Roman money from HS, which tells the modern reader very little, into subsistence (e.g. enough to feed a family of four for a month).

To this estimate of minimum consumption, we need to add some allowance for seed, so that we can make a distinction between minimum net product available for consumption and minimum gross product, sufficient to allow farmers to plant for next year's crop. This measure, minimum gross product, does not imply that everyone produces what he/she eats; some people consume food grown by others, and some are producing goods in return for which they can buy peasants' surplus food. Our first estimate of minimum gross product (minimum net consumption plus seed) covers all production of food, sufficient to maintain minimum subsistence, but does not include other productive activity, except the production of minimal clothing, housing and heat. It is a minimum estimate of gross product; the actual gross product of the Roman empire was certainly higher. But for the moment a minimum is all we need, because if we add price, we get an impeccable equation:

$$\text{Tax} = \text{Proportion}\left[> \begin{pmatrix}\text{Minimum}\\ \text{Gross}\\ \text{Product}\end{pmatrix} = \text{Population} \times \left(\begin{pmatrix}\text{Minimum}\\ \text{Net}\\ \text{Consumption}\end{pmatrix} + \text{Seed}\right) \times \text{Price}\right]$$

All we have to do now is to fit values to components of the equation. It is not as difficult as it may appear at first sight. We can do it tentatively, without committing ourselves to the correctness of any estimate, simply to see where it leads us. First, population. Beloch estimated the population of the Roman empire at the beginning of Augustus' reign at 54 million. I think it was a very good estimate, and much better than his revised figure of 100 million for the end of the first century A.D.[52] Second, minimum net consumption; we have estimated that at 250 kg wheat equivalent per person/year. Next, seed; to please those who rely on ancient sources, let us follow Columella (*On Agriculture* 3. 3) and think that the normal yield for wheat in Italy was four times seed. Under cover of ancient authority, we can leave aside the question, how did Columella know the normal yield of a country as large and as varied as Italy.[53] Let us now arbitrarily apply the same average figure to the empire as a whole, again without committing ourselves to its truth. Seed therefore constituted a quarter of the total crop.

Fourth, price. The normal price of wheat in the first century A.D. is a matter of contention. It obviously varied between seasons, from year to year and from district to

[51] C. Clark and M. Haswell, *The Economics of Subsistence Agriculture*[4] (1970), 57 ff. and 175. I once did some fancy calculations allowing for body weight (adult males 60 kg at age 25 years), age structure ($e_0 = 20$), climate (at Rome), subsistence at 2,000 calories average per person/day. The result coincided with Clark and Haswell's. I added a bit (15 kg wheat equivalent per person/year) for clothing, and a similar notional amount for heat and housing. The end result (250 kg wheat equivalent per person/year) is obviously rough and speculative (after all consumption depends on energy expended and vice versa); I thought it best to express the result in a round number (250 kg) to underline its vagueness. But the probable margin of error is not great.

[52] Beloch, op. cit. (n. 49), 507 and 'Die Bevölkerung im Altertum', *Zeitschrift für Sozialwissenschaft* 2 (1899), 505 ff. and 600 ff.

[53] Columella wrote: 'We can hardly remember a time when cereals in the greater part of Italy yielded four to one.' On varying yields in one Italian district, see, for example, C. Rotelli, 'Rendimenti e produzione agricola nell'Imolese', *Riv. Stor. Ital.* 80 (1968), 121–3, and M. Aymard, 'L'agriculture dans l'Italie moderne', *Annales* 28 (1973), 475–97.

All use subject to JSTOR Terms and Conditions

district. The city of Rome was much more expensive than a farm deep inland in Asia Minor. But variation in no way precludes the calculation or usefulness of an average. Rostovtzeff considered that, if one had to choose a single price for wheat, which he thought unwise, then 3 HS per *modius* (of 6·55 kg) was the single best estimate.[54] Finally, tax-rates: no single figure is obviously right. Effective tax rates in Egypt were significantly higher than in Italy, where there was no direct tax on land. In the provinces, tithes on main crops were common, but so were other tax-rates; and how are we going to take account of indirect taxes such as customs dues, or of taxes on the transfer of property at death, or of tax evasion?[55] Arbitrarily, let us plump for a tax-rate of 10 per cent on gross product and see where it leads us.

We are now in a position to calculate:

$$\text{Tax} = 10\% \left[> \begin{pmatrix}\text{Minimum}\\ \text{Gross}\\ \text{Product}\end{pmatrix} = \begin{matrix}\text{Population}\\ 54 \text{ million}\end{matrix} \times \begin{pmatrix}\text{Minimum}\\ \text{Net}\\ \text{Consumption}\end{pmatrix} \begin{matrix}250 \text{ kg}\\ \text{wheat}\\ \text{equiv.}\end{matrix} + \begin{pmatrix}\text{Seed (a}\\ \text{quarter}\\ \text{of crop)}\end{pmatrix} \times \begin{pmatrix}\text{Price}\\ 3 \text{ HS per}\\ 6{\cdot}55 \text{ kg}\end{pmatrix} \right]$$

$$= 10\% > \left(54 \times 250 \times \frac{4}{3} \times \frac{3}{6{\cdot}55} \text{ million HS}\right) = > (8{,}244 \text{ million HS})$$

$$\text{Tax} = > 824 \text{ million HS}$$

All the constituents of this calculation are hypothetical and tentative. But the result is curiously plausible. Given the estimated cost of the army, at over 350 million HS per year, and its dominance in the state budget, there is not a great deal of room for manoeuvre. Double the population, and you must halve the effective tax-rate or claim that the cost of the army was only a minor element in the state budget. Claim that most people were producing at twice the level of minimum subsistence, or double the price of wheat, then you must halve the effective tax-rate, if the army dominated the state budget. To be sure, this method cannot establish which answers are right, but the matrix of probabilities makes one aware of the implications of choice.

Can we go further? In reality, the gross product of the Roman empire must have exceeded our estimated minimum gross product considerably. Many peasants and non-peasants consumed more than minimum subsistence; many non-peasants produced goods (as did peasants) over and above subsistence needs. But if military expenditure was a very large element in the total state budget—this is the anchor of our calculations—then the budget was probably not much larger than 800 million HS in the early first century A.D. Therefore, the higher our estimate of gross product, the lower the probable tax-rate. Discussion of these variables could be endless. Let me finish with some speculative and

[54] See M. I. Rostovtzeff, *RE s.v. frumentum*, 149; cf. R. P. Duncan-Jones, 'The Price of Wheat in Roman Egypt under the Principate', *Chiron* 6 (1976), 251–3, who lists eighteen wheat prices from lower Egypt in the first century A.D.; the median and modal price was 8 *drachmae* per *artaba* of 32 kg, which Duncan-Jones approximates to 2½ HS per *modius*. By the end of the second century A.D., lower Egyptian wheat prices had more than doubled to 18–20 *drachmae* per *artaba*, but only four prices are known and exactly dated A.D. 191–220. In Asia Minor at the end of the first century A.D., in a small town (Antioch in Pisidia), the normal price of wheat was 2¼ HS per *modius* (*AE* 1925, 126). In the city of Rome, market prices were obviously higher, perhaps 8–10 HS per *modius* (cf. R. P. Duncan-Jones, *The Economy of the Roman Empire* (1974), 345–7). Prices fluctuated both within and between years; fluctuations do not preclude an average, but they should induce caution in its use.

[55] No attempt was made to impose a uniform tax-system or a single tax-rate on crops and land throughout the empire, though some taxes (inheritance tax on citizens, customs dues) were raised across the empire. Some lands in Roman Germany were called *agri decumates*, tithe lands, and tithes had been raised during the Late Republic in Sicily and Asia Minor, by tax-farmers. But Hyginus, who wrote in the early second century A.D., mentioned tax-rates of one-fifth and one-seventh (ed. K. Lachmann (Berlin, 1848), 205); these rates may have been due to local variations, or the result of a rise in tax-rates (perhaps under Vespasian, see n. 68). In Syria, the tax-rate was 1 per cent of the assessed value of the land (Appian, *The Syrian Wars* 50). These were the main taxes, to which we should add indirect taxes. But for the moment I am taking no account of illegal exactions and squeezes. I am concerned only with what the central government and its agents took officially, in whatever form and wherever spent. I have not touched the problem of how and when a tithe of a main crop, such as wheat, was transformed into money. I can only stress the great difference between a declared tax-rate (say 10 per cent) on a main crop, and my first estimate of government revenues as 10 per cent of all produce. The survey by V. Cuinet, *La Turquie d'Asie* (1891) I–IV, gives a detailed analysis of taxes raised in Asia Minor and Syria by the Ottomans at the end of the nineteenth century, and suggests the different contributions from land taxes, cattle taxes, customs which could be raised in a still undeveloped economy.

tentative conclusions: in my opinion, the population of the empire was never much larger than Beloch's estimated 54 million (I exclude temporary acquisitions); gross product averaged out at less than twice minimum subsistence; the effective tax rate was significantly less than 10 per cent of gross product. My reasons for these conclusions are simply that, if either population or gross product had been much larger than these estimates, then effective tax-rates were unbelievably low compared with declared tax-rates (such as tithes, fifths). Finally, I conclude that the annual tax exacted by the Roman state was in the region of 33 kg wheat equivalent per person (10 per cent of 250 kg minimum subsistence plus 83 kg seed), about 15 HS per head. This is more than was raised in France or in England in the sixteenth century, but much less than these kingdoms raised from about 1700.[56] Such measures and comparisons are obviously crude, but they indicate roughly where we should put the Roman state on a scale of social evolution.

Conclusion: low taxes and their consequences

The Roman state was supported by many millions of small contributions. Why were Roman tax-rates low? The end of a long article is not the best place to embark on an answer to this question. But a sketch may help place taxes and trade in a wider political context, and link this essay to recent discussions of the great debasement of Roman silver coinage in the third century A.D. This link is important, because in conclusion I shall suggest that the collapse of taxation in money in the middle of the third century A.D. and its replacement by taxation in kind were closely connected to the contemporary decline in trade. This is a corollary of the propositions with which I started.

Originally, in the early phase of imperial expansion, there had been a gradual progression from the exacting indemnities to pay for past wars, to levying taxes to pay for current, mostly military expenses. But the concept of empire, and of administration, remained simple, because provinces were originally conceived primarily in terms of military conquest and of exploitation. Provincial governors and their aides had only a limited time in charge of a province in which to recover their previous expenses in their political career at Rome and to get rich. These origins were important because they fixed the framework of the later imperial system. The Roman emperors succeeded in restricting some of the worst abuses in provincial administration, without ever eliminating them.[57]

Tax rates could be low principally because the services offered by the Roman administration were rudimentary. By this I do not mean to underestimate the benefits of Roman peace, prosperity and justice—although they have often been exaggerated. One telling index is the extremely sparse presence of élite administrators in the provinces

[56] I shall first state the results, then the elements in the calculation, then the sources.

Results: State budget expenditure per head of population (in kg wheat equivalent)

dates	U.K.	France	dates
1660–4	12	7	1600
1701–10	64	47	1713
1781	96	122	1815

Elements:	United Kingdom			France			
	Budget (million £ sterling)	Wheat Price (£) (per quarter) (211 kg)	Population (millions)		Budget (millions)	Wheat Price (per 100 kg)	Population (millions)

outside Italy. Contrast, for example, the Roman empire with the Chinese. In the second century A.D., to govern a population estimated at 50–60 million people, there were only about 150 senatorial and equestrian administrators in the Roman provinces, that is one élite administrator for every 350,000–400,000 persons. In southern China, in the twelfth century, with a population of a similar size, there were 4,000 gentry officials working in about 1,000 administrative areas outside the capital (compared with forty-five Roman provinces), that is one Chinese élite administrator for roughly every 15,000 people.[58] The scale of difference outweighs any quibbles about the difficulties of comparison. The Chinese government had twenty-five times as many élite administrators at work in the provinces as the Roman government.

The consequence of low penetration by the central government was local autonomy. From one point of view, the Roman administrative system was efficient and cost effective: the ratio of net tax returns to central administrative costs was high. But the ceiling of tax-raising capacity within this system was low and the taxes were maldistributed. These were the costs of local autonomy. Let me elaborate. Because the central government had few representatives of its own in the provinces, it devolved the collection of taxes and the distribution of the tax-load on to intermediaries, who were typically prosperous land-owners and local town-councillors (*decuriones*). The central government in the High Empire had no direct relationship with individual tax-payers. As I understand it, the central government simply fixed the total amount of tax which each town and its surrounding area should pay; local town-councillors then arranged who should pay what, on the basis of a public declaration of the value of each property.[59] There was ample room for abuse, since political power was concentrated in the hands of those who could benefit most from a maldistribution of the tax-load.[60] The oppressed could and occasionally did appeal successfully to the emperor for help in securing justice.[61] But local leaders must often have had friends in the entourage of the provincial governor or at Court, who could be bribed to block an appeal or to present it in an unfavourable light. As a consequence, there was little to stop poorer peasants from paying a disproportionate share of taxes; taxation was regressive. And we should expect there to have been substantial differences between (*a*) what peasants paid in tax and (*b*) what rich land-owners paid on similar land, and between (*c*) what tax-collectors collected and (*d*) what they transmitted to the central government.[62] The basic problem was not merely one of injustice, but rather, in the

[58] B. E. McKnight, *Village and Bureaucracy in Southern Sung China* (1971), 7; cf. D. Twitchett, *Financial Administration under the T'ang*[2] (1963), 11 and 217.

[59] The system is clear from *IG* V (1), 1432–3, convincingly dated by A. Giovannini (*Rome et la circulation monétaire en Grèce* (1978), 115 ff.) to A.D. 35–44. My interpretation of this important inscription is that the Romans levied a tax of 100,000 *denarii* on the town of Messene in southern Greece. The town then divided the tax due by the total declared capital value of property including agricultural holdings (which the inscription lists by district totals) and thereby arrived at a tax-rate, so much per 100 *drachmae* or *denarii* (in fact 8 obols = 1·3 per cent). It is noteworthy that outsiders, *xenoi* explicitly including Romans, had the highest rate of non-payment, at the time the inscription was carved. Cf. A. Wilhelm, *JOAI* 17 (1914), 1–120, for a detailed and interesting commentary with which I reluctantly disagree in part.

[60] I imagine such techniques as collusively low valuation on the élite's own property, early collection of other people's taxes, and late payment of taxes by the rich; loans by the rich to the poor against the surety of their land. My main appeal is to the logic of the situation, and to comparable data from other societies (W. Hinton, *Fanshen* (1966), 39; J. D. Spence, *The Death of Woman Wang* (1978), 43 ff.; R. Huang, *Taxation and Governmental Finance in Sixteenth Century China* (1974). But Roman evidence also exists; see, for example, A. H. M. Jones, *The Later Roman Empire* (1964), 467–9.

[61] A famous plea survives from the tenants of an imperial estate in North Africa; they had already appealed to the emperor's local agent (*procurator*), but he was in cahoots with the administrator or lessor (*conductor*) of the estate: '. . . a collusion which he has practised uninterruptedly not only with Allius Maximus, our oppressor, but also with almost all the lessors, against the law, to the detriment of your treasury. The result is that he has refrained from investigating, for many years, our petitions, supplications and our appeals to your divine rescript; more than that he has yielded to the wiles of the said Allius Maximus, lessor, . . . to such an extent that he has sent soldiers into (our estate) and given orders that some of us be seized and tortured, and others . . . be beaten with rods and cudgels although they are Roman citizens' (*ESAR* IV, 98 = *CIL* VIII.10570, cf. 25902 and 25943).

[62] The logic of the situation and comparative evidence both suggest what we should expect. The explicit recognition of this tactic in research violates the implicit rule or convention among ancient historians that the surviving testimony provides both the building bricks for our history and its authentication. But by what logic do we decide whether the surviving testimony is true, or representative, and how do we decide between conflicting sources? These are not just problems of historical philosophy; they are recurrent problems of historical interpretation.

present context, that any attempt to increase taxes threatened the privileges of the prosperous intermediaries upon whom the central government relied.

My general argument is that the Roman state provided a carapace under which relatively low levels of taxation made possible high private profits. The extent to which Roman private individuals grew rich in the conquered provinces (especially during the period of imperial expansion) is *prima facie* evidence of low rates of taxation. The lower the rate of taxation, the greater the private profit which could be exacted from a finite surplus.[63] And the lower the rate of taxation, the less effective was state supervision of private profiteering from public office. One special case of private profit-making was tax-farming. The Roman government auctioned the rights to collect taxes in the provinces; in this way, the government secured its revenues in advance and cut out some of the fluctuations caused by bad harvests. It transferred both the risks of tax-estimating and the administrative costs of tax-collection to private enterprise. Private investors speculated that, in spite of government supervision, they could nevertheless get more out of provincial tax-payers than they had themselves paid to the central government.[64] Tax-farming was a mechanism of transferring some of the profits of empire to investors, who belonged to the Roman élite and sub-élites, who were not directly involved in conquest (as soldiers) or in government (as senators).

Two developments deserve special attention. First, at the very end of the Republic and in the early Principate, the dominance of tax-farming as a method of tax-collection ended; tax-farming persisted, but in a subordinate role. This demise of tax-farming is almost universally considered as a symptom of moral progress under Roman imperial rule. Ironically, in post-feudal European economic history, the growth of corporate financing and private money-lending to kings is considered a fundamental element in economic growth. The collapse of private finance corporations in Rome meant that there were no institutions which could voluntarily offer private wealth as a buttress for state finances in an emergency. In contrast to post-feudal European economic history, it is worth noting that, as far as we know, the Roman state never borrowed from private individuals or institutions.[65]

A second development of even greater importance was the expansion of land-owning in the provinces by the Roman élite. This was a two-way process: Italians owned more land in the provinces, and more provincial land-owners entered the Roman élite.[66] One result was that members of the Roman élite in the High Empire were typically much richer than they had been in the Late Republic, as their average wealth increased to a level commensurate with the aggregate wealth of the enlarged empire.[67] It was a symptom of the integration of the imperial economy that rents, mostly money rents, were transmitted long distances from provinces, principally to the imperial capital where the élite consumed most. Transmitted rents and taxes had a similar impact on trade, but they were competing for a limited surplus. The higher rents were, the lower taxes had to be.

In an emergency, caused by a rebellion or by barbarian invasions or by an emperor's extravagance at Court, the government had to meet extra demands on resources by getting more money. Several solutions may seem obvious: spending stored reserves, confiscating the estates of the rich, increasing taxes, or debasing the dominant silver coinage. It is

[63] Not that the surplus was fixed in size. Indeed, the imposition of money taxes and rents probably made peasants increase the size of the surplus produced. But the potential for growth was narrowly finite. Private profit therefore competed with public exactions. I should stress that the concept surplus is 'objective': what was produced over and above minimum subsistence. Peasants may have wanted to consume it themselves; they probably did not regard it as surplus to their needs.

[64] Tax-farmers' charges presumably reflected their administrative costs, plus their risks, plus their interest charges on the capital which had been advanced to the Roman government, plus overcharging (loss). E. Badian, *Publicans and Sinners* (1972), in a sympathetic account, rightly stresses how difficult it would have been for the Roman state to administer its large new empire without private entrepreneurial help.

[65] Early in the reign of Vespasian, the senate voted to accept a loan of sixty million HS from individuals, but it was never taken up (Tacitus, *Histories* 4. 47).

[66] Senators in the early second century A.D. were formally required to hold one-third of their fortunes in Italian land (Pliny, *Letters* 6. 19); the proportion was later reduced to one-quarter (SHA, *Marcus Aurelius* 11).

[67] According to Pareto's law, the proportion of total wealth held by the wealthy minority in pre-industrial states is constant (see V. Pareto, *Cours d'économie politique* (1897), 964). Subsequent research has cast some doubt on the strict universality of the law. But it remains suggestive. We should expect the total wealth of Roman senators and knights to grow commensurately with the growth in the size and wealth of the empire.

striking that Roman emperors in the High Empire, as far as we know, either never or only once raised the general rate of taxation.[68] But the silver coinage was repeatedly debased.[69] Recurrent debasement of the silver coinage was a tactic used to solve a recurrent dilemma: how to meet rising government expenditure, especially expenditure on the army, without a corresponding increase in government revenue. In the middle of the third century A.D., barbarian invasions and civil wars induced a headlong reduction in the silver content of coins from about 40 per cent in A.D. 250 to less than 4 per cent in A.D. 270 (compared with 97 per cent in the mid-first century A.D.). The volume of coins minted increased correspondingly. Rapid debasement brought with it a spiral of inflation, which particularly affected soldiers and government officials who were paid salaries in money. The exact sequence of events is obscure since our sources for the period are thin and unreliable. But the main outlines are clear.

The traditional fiscal system broke down. Debasement and inflation had not been matched by an equivalent increase in taxation; indeed, debasement had been used as a method of avoiding an increase in tax rates. As a result, the central government had insufficient money to meet its traditional obligations at current prices. The central government was no longer able to control the empire as a single political system; the spider's web of cash flow was broken (see Figure 4). Soldiers and government officials, at the local level, increasingly took it upon themselves to secure their own supplies, in kind. The central government, as a result, could no longer control local rates of taxation, although it continued to fulminate against abuses. And finally, as currency became the less valuable part of government revenues, the central government could no longer transfer significant amounts of money (which gave command over distant resources) from one end of the empire to another. The breakdown of central control over taxation, that is over the distribution of a large part of the surplus, was reflected in the formation of separate rival governments under a rapid succession of emperors, generals and kings in France, Britain, Egypt and Syria, as well as in Rome.

The collapse of the fiscal system left much economic behaviour untouched. Those with land, peasants and landlords alike, continued to get income from it. Peasants consumed much of their own produce themselves, while landlords could soon adjust rents to current prices, or express them in the more stable forms of wheat or gold or silver (by weight).[70] There was no general reversion from a money economy to what has been called a 'natural' economy. Mostly people traded in local markets in current coins, although we do hear of banks in Egypt more than once closing their doors and refusing to exchange the imperial currency at face value.[71] That said, the mid-third century was almost certainly a period of economic depression. General insecurity probably reduced the volume of inter-regional trade (see Figure 1); the Persians, for example, captured Antioch, while the Goths (Heruli) sacked Athens. In provincial towns, the number of charitable foundations and of incised tombstones dropped; so too did the number of new public buildings, except for defensive town-walls.

In spite of temporary fragmentation, the Roman empire survived as a single political system. The strong government of Diocletian and Constantine (A.D. 284–337) restored central control; they also institutionalized the changes of the previous half-century, notably, for the present discussion, the predominance of taxation in kind. The imposition of taxes in kind throughout the empire had far-reaching implications. First, food raised as

[68] So A. H. M. Jones, *The Roman Economy* (n. 44), 177; Suetonius, *Vespasian* 16: 'he increased tribute from the provinces'; and see n. 55 above. Silence is of course not proof.

[69] Emperors and their advisers do not seem to have realized the consequences of their repeated decisions to debase coins. But then in post-feudal Europe, when the consequences of debasement were roughly known, debasements still occurred, because of their short-term advantages. Cf. C. E. Challis, *Tudor Coinage* (1979); on Roman debasements see J.-P. Callu, *La politique monétaire des empereurs romains de 238 à 311* (1969) and A. H. M. Jones, op. cit., 187 ff.

[70] G. Mickwitz, *Geld und Wirtschaft im römischen Reich* (1932), 120 shows that the proportion of Egyptian land rents (N = 301) expressed only in natural produce rose considerably in the fourth century A.D. compared with previous centuries. And in northern Italy ritual fines for violators of graves, threatened on tombstone inscriptions, were in the early fourth century A.D. expressed in weights of silver and gold, instead of in coin as previously (*CIL* v, 8721 ff.); on which see T. Pekáry, 'Studien zur römischen Währungs- und Finanzgeschichte', *Historia* 8 (1959), 462.

[71] *P. Oxy.* 1411; cf. M. I. Rostovtzeff, *Social and Economic History of the Roman Empire*[2] (1957), 470 ff.

tax cannot easily be transported as far as money; therefore, distances between tax-payers and tax-consumers had to be shortened. In the Late Empire, the establishment of a strategic military reserve stationed behind the frontiers and the reduction in the size of tactical units so that they were smaller than a legion made it easier to supply the army with taxes in kind raised locally. Secondly, the collection of taxes in kind involves more supervision than the collection of money taxes; there are, for example, more problems over quality, quantity and delivery.[72] We should therefore expect, and we do find, an increase in local bureaucracy, which incidentally helped to consume the taxes without transporting them too far. Thirdly, taxes in kind require no transformation of local surplus of food into goods of lower volume and higher value in nearby towns; so we should expect a lower level of artisan and trader activity in a regime relying on taxes in kind. And that is what we find. In the third century, there was a decline in trade and in towns, and by the fourth century there was a definite drop in the volume of silver currency in circulation. In my view, the changes which occurred in the third century A.D. help corroborate my hypothesis, that taxation in money in the High Empire stimulated trade.

Brunel University

APPENDIX. THE COST OF THE ROMAN ARMY

Frank (*ESAR* v, 5) estimated the total cost of the Roman army in the reign of Augustus, excluding auxiliaries, at 245 million HS. Some details, such as the number of praetorians, the total pay of privileged soldiers (*duplicarii*) and of officers (centurions) and the cost of the navy are disputed. But two problems stand out: the pay of auxiliaries and the total cost of retirement bounties.

I am persuaded by M. Speidel, 'The Pay of the Auxilia', *JRS* 63 (1973), 141 ff., that auxiliary pay was probably five-sixths of legionary pay. Speidel cautiously reserved his position, and conceded that auxiliary pay was perhaps only two-thirds of legionary pay. But his is the most sensible explanation of two important papyri recording pay to soldiers in Egypt and is compatible with the third (see R. O. Fink, *Roman Military Records on Papyrus* (1971), 68–70). In general terms, auxiliary pay must have been at a level high enough to secure the recruitment of over 150,000 soldiers under arms, enlisted for twenty-five years' service. This level of recruitment precludes a rate of pay as low as one-third of legionary pay. In the rough calculation below, I have entered auxiliary pay as five-sixths of legionary pay, without making any complicated adjustments to allow for the fact that a large minority of auxiliaries were cavalrymen, paid at premium rates.

Secondly, retirement bounties: I mention them because it is not unknown for scholars to estimate the cost of retirement bounties by dividing the number of legionaries by the normal length of service (16, 20, and later 25 years) and multiplying by 12,000 HS. Did no Roman soldier die during military service? Did none receive promotion and so extra bounty? If we boldly assume that all soldiers were recruited on their seventeenth birthday, that no more died than would have died naturally (at $e_0 = 25$ years), then in an army of 150,000 men, 8,200 would survive after sixteen years' service, 6,000 after twenty years' service and 4,400 after twenty-five years' service. These figures from UN model life tables can only be rough estimates, but they reveal the fiscal pressure towards lengthening military service. The increase from sixteen years' service to twenty-five years' service almost halved the total cost of retirement bounties. At twenty years' service, with an army of 150,000 legionaries and with retirement bounties at 12,000 HS, the total annual cost was 72 million HS. Incidentally, are we sure that auxiliaries received no retirement gratuity? No source says so. Was it really possible to recruit equal numbers of troops to each branch of the army (auxiliary and legionary) with marked discrepancies of reward especially in the second century A.D., when many auxiliary recruits were already Roman citizens?

[72] For theoretical and comparative works, see Ardant, op. cit. (n. 28); R. M. Bird, *Taxing Agricultural Land in Developing Countries* (1974); see also S. N. S. Cheung, 'Private Property Rights and Share Cropping', *J. Pol. Econ.* 76 (1968), 1107–22, and C. Issawi, 'Farm Output under Fixed Rents and Share Tenancy', *Land Economics* 33 (1957), 74–7, for similar problems in relation to rent. The most sophisticated ancient discussion of taxation is in the speech attributed to 29 B.C. but written in the early third century by Cassius Dio (52. 28 ff.). One should also note the early Arabic treatises on taxation, dating from the eighth century A.D. onwards, which probably in part derived from lost Byzantine texts or from Byzantine practice. See Ya'qub ibn Ibrahim *alias* Abu Yousouf Ya'qoub, *Le livre de l'impôt foncier*, trans. E. Fagnan (1921), esp. 74–5, and A. Ben Shemesh (ed.), *Taxation in Islam* (1969) III, 100–1.

However that may be, on the stated assumptions, in the first century A.D. the total cost of the army on Frank's estimate, with my two revisions, was:

	million HS
140,000 legionaries (126 million HS) plus officers, etc. (34 million HS)	160
150,000 auxiliaries at five-sixths legionary pay	133
Retirement bounty for 5,600 legionaries per year	67
Praetorians, urban cohorts (including bounties), ordnance, transport, navy	85
	445 (± 50) million HS

From the Neolithic to the Bronze Age in Central Italy: Settlement, Burial, and Social Change at the Dawn of Metal Production

Andrea Dolfini[1]

Published online: 20 December 2019
© The Author(s) 2019

Abstract
The Late Neolithic and Copper Age were a time of change in most of Europe. Technological innovations including animal traction, the wheel, and plow agriculture transformed the prehistoric economy. The discovery of copper metallurgy expanded the spectrum of socially significant materials and realigned exchange networks away from Neolithic "greenstone," obsidian, and *Spondylus* shells. New funerary practices also emerged, signifying the growing importance of lineage ancestors, as well as new ideas of personal identity. These phenomena have long attracted researchers' attention in continental Europe and the British Isles, but comparatively little has been done in the Italian peninsula. Building on recent discoveries and interdisciplinary research on settlement patterns, the subsistence economy, the exchange of socially valuable materials, the emergence of metallurgy, funerary practices, and notions of the body, I critically appraise current models of the Neolithic-Bronze Age transition in light of the Italian regional evidence, focusing on central Italy. In contrast to prior interpretations of this period as the cradle of Bronze Age social inequality and the prestige goods economy, I argue that, at this juncture, prehistoric society reconfigured burial practices into powerful new media for cultural communication and employed new materials and objects as novel identity markers. Stratified political elites may not be among the new identities that emerged at this time in the social landscape of prehistoric Italy.

Introduction

In much of Europe, the late fifth to the late third millennia BC was characterized by four sweeping changes that fundamentally altered the fabric of Neolithic society (Broodbank 2013; Heyd 2007; Kristiansen 2015; Robb and Harris 2013; Whittle 1996). The first was the gradual transformation of landscapes of settlement, as long-lived villages were generally abandoned, and more mobile economic regimes and lifestyles emerged. The second, occurring in lockstep with the first, was the new prominence of burial as a social practice, including the establishment of formal cemeteries, new funerary structures (e.g., megaliths and chamber tombs), and mortuary rites that centered on two seemingly contrasting principles: the breaking up and mixing of ancestors in collective tombs, and the expression of personal identity in individual burials. The third was the intensification of human mobility and social interaction, as evidenced by the long-distance exchange of prized materials such as Alpine "greenstone" and obsidian, as well as population movement on a scale not seen since the Mesolithic–Neolithic transition (Kristiansen et al. 2017). The fourth was a suite of technological innovations of which metalworking was certainly the most conspicuous but that also encompassed the harnessing of animal power for plowing and wheeled transport. New domesticates also were introduced at this time—the donkey in the eastern Mediterranean and the horse in most of Europe—and old domesticates were put to new uses, ushering in what Sherratt (1981, 1983) famously termed the "secondary products revolution."

Notwithstanding the many countertrends visible in the regional record (e.g., large fortified settlements in Iberia; Garcia and Murillo-Barroso 2013), these entwined material and social transformations seemingly affected, with varying intensity, all late Neolithic and Chalcolithic societies from northern Europe to the Mediterranean and from the Balkans to the Atlantic façade. They have long invited social, economic, and political explanations.

Culture historians traditionally explained the change by invoking population movement, the spread of ideas, and the introduction of new technologies, first and foremost copper metallurgy (Childe 1957; Gimbutas 1977; Puglisi 1959). Childe (1957), in particular, maintained that metals would have triggered a profound transformation in European society by enabling accumulation, exchange, and inheritance of valuables at an unprecedented scale, under the stimulus of early Mesopotamian urban centers. His views have had a lasting fortune in prehistoric studies, inspiring historical materialist models that are being debated to this day. Central to them is the belief that metals and related prestige goods would enable the creation of ranked societies, in which power was either fought over through male peer competition or inherited by descent. Long-distance trade, control of material resources, and coercion were seen as some of the key mechanisms driving the sociopolitical transformation of Neolithic Europe toward systemic inequality (e.g., Chapman 2003; Gilman 1991; Kristiansen 2015). These ideas have cast a long shadow in archaeological discourse. Over the years, they have been rephrased according to different theoretical standpoints.

Working within (broadly defined) postprocessual frameworks, Shennan (1982), Thorpe and Richards (1984), and Braithwaite (1984) maintained that late Neolithic Europe underwent fundamental changes in the nature of social relations. These entailed the replacement of large-scale collective rituals centering on competitive consumption with more individualized forms of prestige, expressed by weaponry and other prized personal possessions. Building on these readings, Barrett (1994) and Thomas (2002) stressed that changes in social relations were mediated by a new emphasis on individual burial, away from the notions of collective ancestry typical of Neolithic mortuary practices. For many, rank (expressed by prestige goods) and genealogy (expressed by new burial rites) were interlocked. Historical materialists such as Peroni (1989, 1996) and Guidi (2000) saw both strategies as being jointly used by emerging elites to legitimize the acquisition and transmission of power, laying the foundations of hierarchical Bronze Age society.

Other authors focused on the economic transformation of late Neolithic and Chalcolithic Europe. Sherratt (1981, 1983), in particular, posited that the introduction of woolly sheep, plow agriculture, and animal traction from the Near East would have resulted in dramatic changes in sociopolitical organization. In his view, these innovations led to a revolution in subsistence strategies, superregional exchange, and settlement patterns, sowing the seeds of the interconnected Bronze Age "world system" (Sherratt 1993). Though very influential, Sherratt's model was later shown to compress into a relatively short period a broad suite of economic and technological transformations that occurred, in a staggered fashion, over thousands of years (Greenfield 2010). It also was criticized for being a new iteration of old-school *Ex Oriente Lux* readings that created an unwarranted dichotomy between dynamic Near Eastern urban civilizations and stagnant European agrarian societies (Robb 2007, p. 288).

The most recent scholarship on the subject divides into two broad strands: social constructionist models and neodiffusionist interpretations. The first is championed by Robb (2007) and Robb and Harris (2013), among others (e.g., Fowler 2018). Having critiqued all previous paradigms for their reliance on a prime mover of sorts, Robb (2007) grounded his reading in cross-cultural mechanisms of social reproduction. Following Bourdieu (1977), he argued that change may result from myriad acts of realignment and repositioning of knowledgeable actors within overarching social structures. From this theoretical standpoint, he proposed that late Neolithic society would be marked by new forms of value that were appropriated by emerging political leaders for self-promotion. Working within a similar interpretative framework, Robb and Harris (2013) further suggested that the new value system would have hinged on a binary gender ideology. This was expressed though a suite of media including individual burial, anthropomorphic statuary, and a new "body technology": metals.

At the other end of the interpretative spectrum are several authors who champion a new synthesis of culture history, language studies, and archaeological science. Their controversial opinions have triggered a heated debate that shows no signs of abating (Furholt 2018; Heyd 2017; Hofmann 2015; Vander Linden 2016). The first salvo was fired by Mallory (1989). He revived early culture historians' proposals that a wave of migrant pastoralists from the Pontic-Caspian steppe would have swept

through Europe in the third millennium BC, bringing with them new domesticates and economic practices, new technologies, and the Indo-European language (see also Anthony 2007). Recent breakthroughs in ancient DNA analysis have stoked the fires of the cross-disciplinary controversy. The new research has sought to link the spread of certain genetic traits throughout continental Europe and the British Isles with the diffusion of Yamnaya, Corded Ware, and Bell Beaker cultural groups from the late fourth millennium BC. Some scholars have also tied these migratory events to the diffusion of early Indo-European languages (Allentoft et al. 2015; Haak et al. 2015; Kristiansen et al. 2017; Olalde et al. 2018).

With few exceptions, the models and interpretations discussed above are grounded in the archaeology of continental Europe and the British Isles. Central among them are cultural phenomena that may be marginal or absent in Mediterranean Europe, including the Italian peninsula. For instance, Bell Beaker burials and objects are present (if not necessarily widespread) in northern Italy but are rarely found south of the Arno Valley, Tuscany (Sarti and Martini 2001). Similarly, individual "warrior" burials are often linked to the spread of Corded Ware, Bell Beaker, and related cultural phenomena (and perhaps to the arrival of new people) in third millennium BC Europe (Harrison and Heyd 2007; Heyd 2017), but they emerged in Italy in different cultural contexts that date to the mid-fourth millennium BC (Dolfini 2010; Jeunesse 2014). Barring earlier, yet undetected "cultural stimuli" or population movements from north/central Europe or the Eurasian steppes, it is hard to see how the two phenomena are connected. Similar observations have been put forward regarding the alleged eastern European connections of the Iberian Chalcolithic (Guilaine 2018).

Under these circumstances, Mediterranean Italy provides a useful arena for testing broad cultural trends and interpretative models in European prehistory as a whole. To what extent do they apply to this region? In what direction does Italy "look" at this time? North, across the Alps, or south, across the water? Does it look in any direction at all? The region is particularly well suited as a testing ground thanks to a host of recent discoveries and research advances that have not yet seeped into the international Anglophone literature. Nowhere has this outburst of study been more apparent than in central Italy, where numerous new sites have been excavated and old excavations published. Focusing my multiscalar analysis on central Italy (drawing in data and *comparanda* from other parts of Italy as relevant and appropriate) allows me to work at the interface between local and superregional social dynamics that may be lost in the study of a broader area. Central Italy is not an arbitrary unit of analysis, but one that has a long pedigree in Italian prehistoric studies (e.g., Barker 1981; Guidi and Piperno 1992; Peroni 1996; Pessina and Tiné 2008). Due to its elongated geography and rugged morphology, Italy historically shows diverging cultural trajectories in the north, center, and south. More often than not, these have a *longue durée* stretching back into prehistoric times, thus making regional examinations of this kind all the more apposite (Horden and Purcell 2000).

Chronologically, I focus on 4500–2200 BC, known as the late Neolithic and Copper Age (or Eneolithic) in Italian periodization. Despite the recent surge of interest in the archaeology of this period, specialists have not yet reconsidered to what extent the new data may be harmonized into established interpretations. Two problems, in

particular, stand in the way of novel conceptualizations of this period. The first is a tendency to narrowly concentrate on specific themes and subjects, paying scant attention, if any, to how new data affect the broader picture. The second is a scholarly predisposition to discuss the Late Neolithic and Copper Age as separate phases. Even when attempts are made to cross the divide (e.g., Robb 2007; Whittle 1996), Neolithic specialists read the sequence from their particular vantage point, which construes the Copper Age as a hyper-evolved late Neolithic. Conversely, Copper Age specialists treat the mid-fourth millennium BC as an impassable cultural watershed, thus failing to investigate late Neolithic social dynamics and how they paved the way for the Chalcolithic world.

My aim is to provide a fresh picture of central Italy from 4500–2200 BC, in which different strands of evidence are cross-interrogated and critically combined. I also offer a coherent view of the entire sequence, devoid of the disciplinary biases decried above. I highlight continuities as well as discontinuities in the material and social dynamics of the two phases, focusing in particular on the natural environment and landscape, the chronological and cultural sequence, settlement and the subsistence economy, connectivity and exchange, the emergence of metallurgy, and funerary practices and ideas of the body. I conclude with a critical reappraisal of Late Neolithic and Copper Age sociopolitical dynamics, followed by reflections on where future research ought to be steered.

The Natural Environment and Landscape

Central Italy is the middle section of the boot-shaped Italian peninsula, comprising (north to south, in clockwise order) modern-day Marche, Abruzzo, Lazio (Latium), Umbria, Toscana (Tuscany), and eastern Liguria (Fig. 1). Liguria is normally thought to belong to northern Italy, but I include it in this review as it arguably had close cultural ties with Tuscany in the period under examination (limited to its eastern part). In the north, central Italy is demarcated by the uppermost tract of the Apennines, a major mountain range that is the natural backbone of the peninsula. In the east and west, it is bounded by the Adriatic and Tyrrhenian Seas, respectively. In the south, it is somewhat artificially defined by the modern administrative borders of Latium and Abruzzo, which provide a boundary of sorts with the southern peninsula. The region is extraordinarily varied in landforms, encompassing low coastal plains and marshlands (now largely reclaimed), areas of rolling hills, wide river basins that provide highways for human mobility (e.g., the Arno and Tiber Valleys), steep crags and ravines in the volcanic landscapes of southern Tuscany and northern Latium, and snow-capped peaks and intermontane basins in the central Apennines (Barker 1981; Walker 1967).

The region is part of a broad biogeographical zone that comprises the northwestern quadrant of the Mediterranean basin (Blondel et al. 2010). Climatically, it has hot, dry summers and mild to cool winters, when most of the rain falls. However, variation is great due to both morphology and altitude. The Tyrrhenian and Adriatic lowlands are characterized by fall and winter rainfall maxima, while summers can be extremely dry. In contrast, the Apennine uplands are prone to cooler and

wetter summers. Much of the high-altitude zone experiences subalpine winter temperatures. Here, deep snow frequently covers the mountain ridges and high pastures from October to April, and a glacier nestles within the Corno Grande, the highest peak of the Apennines (Grunewald and Scheithauer 2010; Walker 1967).

Broadly speaking, vegetation patterns follow the morphological and altitude categories outlined above. The eastern and western lowlands are home to coastal forests and shrublands featuring a mixture of holm oak (*Quercus ilex*), cork oak (*Quercus suber*), and other evergreen species. The intermediate zone, between about 500 and 1000 m above the sea level, is dominated by sub-Mediterranean deciduous woodlands comprising hazel (*Corylus*), elm (*Ulmus*), and various species of oak. The mountain zone above 1000 m features majestic forests of beech (*Fagus sylvatica*) as well as the last remnants of conifers, which are especially rich in fir (*Abies*) (Barker 1981, pp. 21–23; Walsh 2014).

In the Early and Middle Neolithic (c. 5800–4500 BC), the region benefited from the relatively stable conditions brought about by the Early Holocene climatic optimum, which was characterized by warmer-than-average temperatures and higher-than-average precipitation rates, although variation was great depending on both latitude and altitude (Davis et al. 2003). This changed dramatically in the Late Neolithic and Copper Age, which were affected by a marked drier turn. In central Italy, the Mid-Holocene climatic deterioration is evident in several proxies including pollen spectra and lake levels, which all point to the slow but inexorable contraction of the native woodlands. This was not only caused by climate change but also by the first episodes of forest clearance and woodland management (Allen 2003; Branch and Marini 2014; Giraudi et al. 2011; Magny et al. 2007; Walsh 2014). The process can best be followed in the pollen diagram from Valle di Castiglione (Rome) and is further confirmed, in its broader trends, by other pollen spectra from the region (Colombaroli et al. 2007; Magri and Sadori 1999; Sadori et al. 2011). At Valle di Castiglione, the Early Holocene expansion of deciduous species peaked in the mid/late fourth millennium BC, followed by a contraction of the tree cover and the expansion of cereals and other herbaceous plants brought about by combined aridity and forest clearance (Follieri et al. 1989).

Although initially limited in its wider environmental effects, forest clearance triggered the first episodes of soil erosion and the earliest occurrences of progradation, or coastline advancement, due to increased sediment accumulation at river

mouths and the Early Holocene sea-level rise slowing to a halt (Barker et al. 1990; Bellotti 2017; Coltorti 1997; Roberts et al. 2011). For the first time, pastures were carved into the forested uplands, and woods were actively managed to provide sustenance for people and livestock. The process is especially visible at Prato Mollo, a high-altitude peat site in eastern Liguria. Here, pollen analysis has revealed that the native tree cover dominated by silver fir (*Abies alba*) retreated significantly from the early third millennium BC due to multiple wildfires. The forest was replaced by grassland and open beech (*Fagus*) woodland—a species ostensibly promoted as it provides excellent cattle fodder. Tree cover deterioration is further confirmed by soil analysis, which yielded plentiful evidence of peat formation, erosion, and waterlogging (Maggi and De Pascale 2011). These phenomena are motivated by sweeping changes in prehistoric subsistence practices. Before discussing those changes, I first clarify the chronological and cultural sequence as defined by radiocarbon and ceramic assemblages.

Chronology and Cultural Sequence

Absolute Chronology

For most of the 20th century, archaeologists utilized pottery styles to construct chronological and cultural sequences for later Italian prehistory. Their work was predicated upon the unspoken assumption that ceramic styles neatly succeeded one another and could, therefore, be taken to represent discrete chronological phases and cultural groups (Radmilli 1975; Trump 1966). The fall of culture history as a theoretical paradigm and the spread of independent means of dating showed the inherent limits of this approach. Scholars then realized that changes in pottery styles need not be synchronous or evenly spread across bounded territories, and that conventional ideas of the "archaeological culture" (*sensu* Childe 1929, pp. v–vi) no longer reflected the growing complexity of the material record. This state of affairs elicited different responses in the Anglophone and Italian/continental scholarship. By and large, the former lost interest in the minutiae of ceramic typology and shifted their research to social issues such as the prehistoric economy, prestige goods exchange, and burial practices (e.g., Barker 1981). The latter, on the other hand, doubled their efforts to build ever more sophisticated chronological frameworks based on the evolution and spread of pottery styles. Over time, this evolved into a hyperspecialized and, for many, arcane research strand (e.g., Cocchi Genick 1994, 1996, 2008).

Regardless of their interest in pottery styles, however, both communities continued to share the broad chronological edifice framing their studies. Until relatively recently, all students of Italian prehistory dated the Late Neolithic to the fourth millennium BC and the Copper Age to the third millennium BC (Cocchi Genick 2013a, p. 234). The *status quo* was first challenged in the 1990s when absolute dating methods highlighted major inconsistencies with the established framework. Research carried out in the last 20 years has all but clarified the overall chronology of the period in question, showing that the Late Neolithic began in mid-fifth millennium BC and the Copper Age a thousand years later. The two periods are separated by

a short-lived Final Neolithic phase in the early fourth millennium BC. Despite the significant progress made, however, specialists still disagree about the exact duration of each phase, as well as about the identification and precision dating of discrete subphases within them (compare, e.g., Leonini et al. 2013 and Negroni Catacchio et al. 2014).

The Late and Final Neolithic chronology proposed here is built on Pessina and Tiné (2008), although I favor a slightly later boundary between the two phases than what they suggest; this better accounts for the central Italian record. The onset of the Copper Age is placed at 3600 BC based on the Bayesian model developed by Maggi and Pearce (2013), while the tripartite subdivision of the period is modeled on Skeates (1996), modified to account for recent AMS dating (e.g., Anzidei et al. 2012; Cocchi Genick 2013b; Dolfini 2010; Manfredini et al. 2009). The end of the Copper Age is placed at 2200 BC, bearing in mind that certain Chalcolithic technological and cultural practices (e.g., arsenical copper metallurgy and burial in caves) continued into the Early Bronze Age. This chronology has an overall tolerance of ±100 years due to the confidence range of most radiocarbon dates (Table 1).

Pottery Styles and Their Social Interpretation

Despite the firm ground created by radiocarbon, a great many old excavations, and much recent developer-funded fieldwork, lack absolute dates. For these sites, pottery still is an indispensable chronological tool, notwithstanding the limitations highlighted above. Stylistic classification is especially useful when pottery designs have relatively well-defined temporal and territorial boundaries, as is often the case in the Late Neolithic. The picture blurs and complicates in the Final Neolithic and Copper Age, when various ceramic traditions coexisted for hundreds of years, mingling and overlapping in complex and ever-shifting ways. Even in these periods, however, pottery still supplies valuable chronological and cultural data to specialists.

In the latter part of the fifth millennium BC, Middle Neolithic incised and painted wares were replaced by new, shallow forms of ceramic vessels with plain burnished surfaces. This regional trend reflects a generalized change in aesthetic principles that was in operation throughout most of Mediterranean Europe (Broodbank 2013; Robb 2007). The new preference for wider vessels and glossy surfaces is apparent in all three ceramic styles found in Italy at this time: Chassey-Lagozza (a variant of the French Chassey style) in the northwest; Late Ripoli in the east; and Diana in the south (Cocchi Genick 2009; Malone 2003; Pessina and Tiné 2008).

Table 1 Relative and absolute chronology of prehistoric central Italy, 4500–2200 BC

Archaeological phase	Absolute chronology
Late Neolithic	4500–3800 BC
Final Neolithic	3800–3600 BC
Early Copper Age	3600–3300 BC
Middle Copper Age	3300–2700 BC
Late Copper Age	2700–2200 BC

The central peninsula is split east-west in its cultural manifestations. Late Ripoli wares are ubiquitous east of the Apennines (Cremonesi 1965). They feature shallow bowls and plates as well as deep vases that anticipate Copper Age flasks and bottles. Pots were normally plain and burnished to a gloss, but a new taste for textured and rough surfaces emerged in the latter part of the phase, as did a marked tendency toward regionalization. At the same time, however, the shapes and decorative choices of vessels were increasingly open to superregional influences, including, for example, the incorporation of Chassey-Lagozza and Diana elements into Late Ripoli repertoires (Pessina and Radi 2002, 2003; Pessina and Tiné 2008).

West of the Apennines, domestic sites have yielded idiosyncratic assemblages consisting of ceramic styles from the northern, eastern, and southern peninsula (Fig. 2). It is not uncommon for vessels in the Chassey-Lagozza, Late Ripoli, and Diana styles to be found, all at once, at the same site. Strikingly, these styles are often recombined and amalgamated locally so that it is almost impossible to find two Late Neolithic settlements bearing the same ceramic fingerprint (Cocchi Genick 2009, p. 174). At Quadrato di Torre Spaccata, for instance, Diana finewares, with their buff red-slipped surfaces and *rocchetto* (spool shaped) handles, are found alongside shallow bowls and plates in the Chassey-Lagozza style, as well as vessels in various Late Ripoli regional groups (Anzidei and Carboni 1995; Anzidei and Zarattini 2007). As with coeval evidence from Adriatic Italy, this puzzling state of affairs can be explained by a seemingly contradictory move toward regionalization and superregional interaction, although the material outcome is here entirely peculiar. This trend progressed further in the Final Neolithic, which featured the continued development of eclectic, highly localized ceramic assemblages, as well as the near-complete substitution of coarse *impasto* vessels for burnished finewares (Anzidei et al. 2002; Sarti et al. 2005; Silvestrini et al. 2002).

The onset of the Copper Age is marked by a "perfect split" between domestic and funerary pottery on both sides of the central peninsula, and indeed farther north and south. On the one hand, the new taste for coarse wares with textured surfaces continued at open villages and other habitation sites. Building on previous developments, Copper Age domestic ceramics were shaped and ornamented according to a bewildering variety of stylistic traits, which household and village potters blended into original material assemblages (Cocchi Genick 2008). On the other hand, the Late Neolithic preference for burnished surfaces was carried, unabated, into the mortuary realm. The bottles, flasks, and bowls now placed with the dead followed normative stylistic conventions shared over large areas. It is as though the ceramic unity of the Late Neolithic world, smashed to pieces in the domestic arena, had been recreated for the benefit of the dead.

Bell Beaker pottery was introduced into the region in the Late Copper Age, most notably in the Arno Valley and along the middle Tyrrhenian coast (Bulgarelli et al. 2000; Sarti 1995–1996, 1997, 1998). Apart from a handful of burials from these areas, Beaker-style vessels and accoutrements were rarely used in the realm of the dead. Out of over 100 chamber tombs excavated in inner central Italy, only one has yielded Beaker pottery (Negroni Catacchio and Miari 1995; Petitti et al. 2002). There is, however, one notable exception to this quasi-universal pattern: Fosso Conicchio in northern Latium. The site consists of a subcircular sunken pit 1.75 m deep and 3.10 m across,

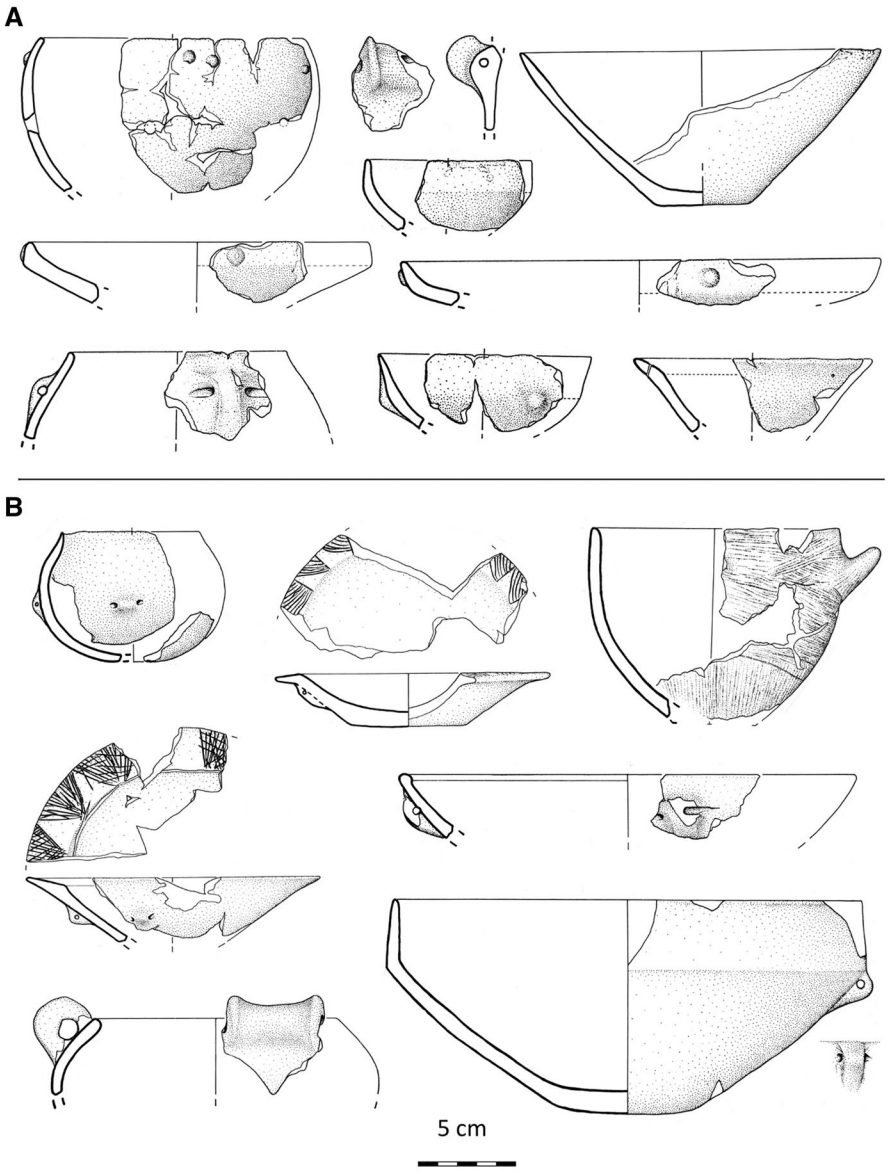

Fig. 2 Late Neolithic ceramic styles from west-central Italy: A, Late Ripoli pottery from Casale di Valleranello, Rome; B, pottery from Quadrato di Torre Spaccata, Rome, mostly in the northern Chassey-Lagozza style, but the bottom left vessel has a *rocchetto* (spool-shaped) handle typical of southern Diana wares (image: Giovanni Carboni)

cut into the limestone bedrock. As it lacks any evidence of roofing, the pit was seemingly accessed from the top, perhaps using a wooden ladder. To one side of the structure lies a trapezoidal altar-like platform hewed into the rock. This provided a focus for

rituals involving the placement of lavishly decorated Beaker vessels, Beaker-style wrist guards, human teeth, and cremated human remains (Fugazzola Delpino and Pellegrini 1999). The site is entirely out of character for this area, dominated by Rinaldone-style chamber tombs (see below). Fosso Conicchio should not be considered a burial site proper but a locus for the ritual processing of ancestral remains. This underscores the impression that, in Copper Age Italy, choices regarding pottery styles were predicated upon the practices in which the vessels were meant to be used and cannot be reduced to abstract notions of the "archaeological culture."

The pulverization of ceramic styles and clear-cut separation between domestic and funerary pottery is not exclusive to central Italy. Other regions of Europe experienced similar phenomena in the fourth millennium BC. In southern France, for example, the late Neolithic Chassey "culture" was replaced from 3500 BC by multiple small-scale ceramic styles featuring, like in central Italy, impressive intergroup variation as well as superregional influences (Gutherz and Jallot 1995; Vaquer 1990). According to Vander Linden (2006), the change reflects growing sociopolitical tensions between increasingly fragmented communities. He argues that a novel emphasis on weapon burials, high rates of skeletal trauma, and the expansion of drystone defensive architecture would further highlight intercommunity friction in a fast-changing social landscape.

It is unclear if this reading may apply to central Italy given the lack of recent, theoretically informed research into Copper Age pottery styles in the region. My interpretation, though not yet supported by dedicated research, tentatively moves in a different direction. Rather than demarcating more localized forms of group identity, the breakup of domestic ceramic styles might, in fact, stem from a dramatic deflation of their social significance. In the Neolithic world, finewares were utilized at villages in core social reproduction practices such as feasting and burial (Robb 2007; Skeates 1995a). Though mostly made and used locally, the pots were built and decorated according to widespread stylistic conventions, which were probably shared via the extensive exchange networks in operation at the time (see below). In the fourth and third millennia BC, domestic pottery was no longer employed in identity-building social interactions, for these were now carried out at burial sites using vessels that, like Neolithic domestic pottery, were ornamented based on widely shared aesthetic principles; these are rarely found at habitation sites. Bereft of its former social significance, domestic pottery was downgraded to crockery, expediently built and mundanely used—hence its bewildering variety of styles, likely reflecting village-based (and perhaps household-specific) craft traditions. Still, village communities continued to relate with one another, as the sharing of decorative motives indicates. This offers tantalizing glimpses into yet unexplored patterns of interaction within self-contained communities of practice.

Settlement and the Subsistence Economy

In several regions of Europe, the late fifth to late third millennia BC is characterized by the decline of the village as the center of people's identity and social life, and the rise of the extramural cemetery. This is paralleled by the introduction of more

mobile lifestyles and economic regimes that were increasingly reliant on livestock and their secondary products (Broodbank 2013; Whittle 1996). In central Italy, there were three broad changes in landscapes of settlement and subsistence strategies. The first is the abandonment of long-lived Neolithic villages, which were progressively replaced by dispersed settlements, isolated farmsteads, and seasonally inhabited caves and open stations. The second is the expansion of human activity from arable lowlands and river terraces into marginal landscapes such as uplands, high mountains, and coastal and riverine wetlands. The third is a shift toward more diversified economic practices based on mixed farming, herding, and hunting (Barker 2005; Robb 2007; Skeates 1997a, 2013).

A tendency toward settlement dispersal first manifested itself in the fifth millennium BC, when sizable villages with long occupation spans (e.g., Catignano; Tozzi and Zamagni 2003) were progressively replaced by short-lived, insubstantial settlements, whose archaeological footprints often amount to nothing but pits, cobblestones, and hearths (Fugazzola Delpino et al. 2003; Grifoni Cremonesi 2003b; Grifoni Cremonesi et al. 2001; Manfredini et al. 2005a). This trend continued into the fourth and third millennia BC. At Quadrato di Torre Spaccata (Fig. 3), for example, the Copper Age village consists of two elliptical houses, a rectangular wattle-and-daub building, and other minor structures, all inhabited at the same time (Anzidei and Carboni 1995, 2007). At Casale del Cavaliere, excavations revealed an isolated farmstead occupied for maybe one or two generations, as indicated by the lack of superimposed features and the high number of refitting sherds (Boccuccia et al. 2000). Le Cerquete-Fianello, a small village on the edge of the now-drained Maccarese lagoon, seems at first glance more substantial. However, the stratigraphic analysis of its five wattle-and-daub houses has revealed three building phases spanning, one may speculate, no more than 200 years (Manfredini 2002).

The demise of the nucleated village was long believed to be caused by growing seasonal mobility and intensified pastoralism, especially in the Apennine uplands (Barker 1981; Maggi 2002; Maggi and De Pascale 2011). Recent research has nuanced this picture by showing that large village communities continued to thrive during the Copper Age and that lowland alluvial plains and river valleys were often cultivated more intensively than ever before. This interpretative shift was spearheaded by a series of spectacular discoveries from the northern and southern peninsula. North of the Apennines, the habitation site at Parma-Via Guidorossi has solidly built houses up to 52 m in length (Bernabò Brea et al. 2011, 2013). Farther south, open-area excavations in the hinterland of Naples (e.g., at Gricignano d'Aversa) brought to light an intensively inhabited landscape in which villages and cemeteries were encased within a mosaic of plowed fields, water wells, and dirt roads (Fugazzola Delpino et al. 2007; Laforgia and Boenzi 2011; Saccoccio et al. 2013). This picture is compounded by numerous, if not quite so dazzling, discoveries from central Italy. Suffice here to mention the large elliptical houses at Tor Pagnotta and the conspicuous ditches and palisades surrounding Maddalena di Muccia and Selva dei Muli (Anzidei et al. 2011a; Cerqua 2011; Manfredini et al. 2005b). In the fertile lowlands, sustained landscape infilling seemingly took place in the Copper Age, as shown by settlements lying closer to one another than in previous periods. It is unclear, however, if this is evidence of population growth, for it might be

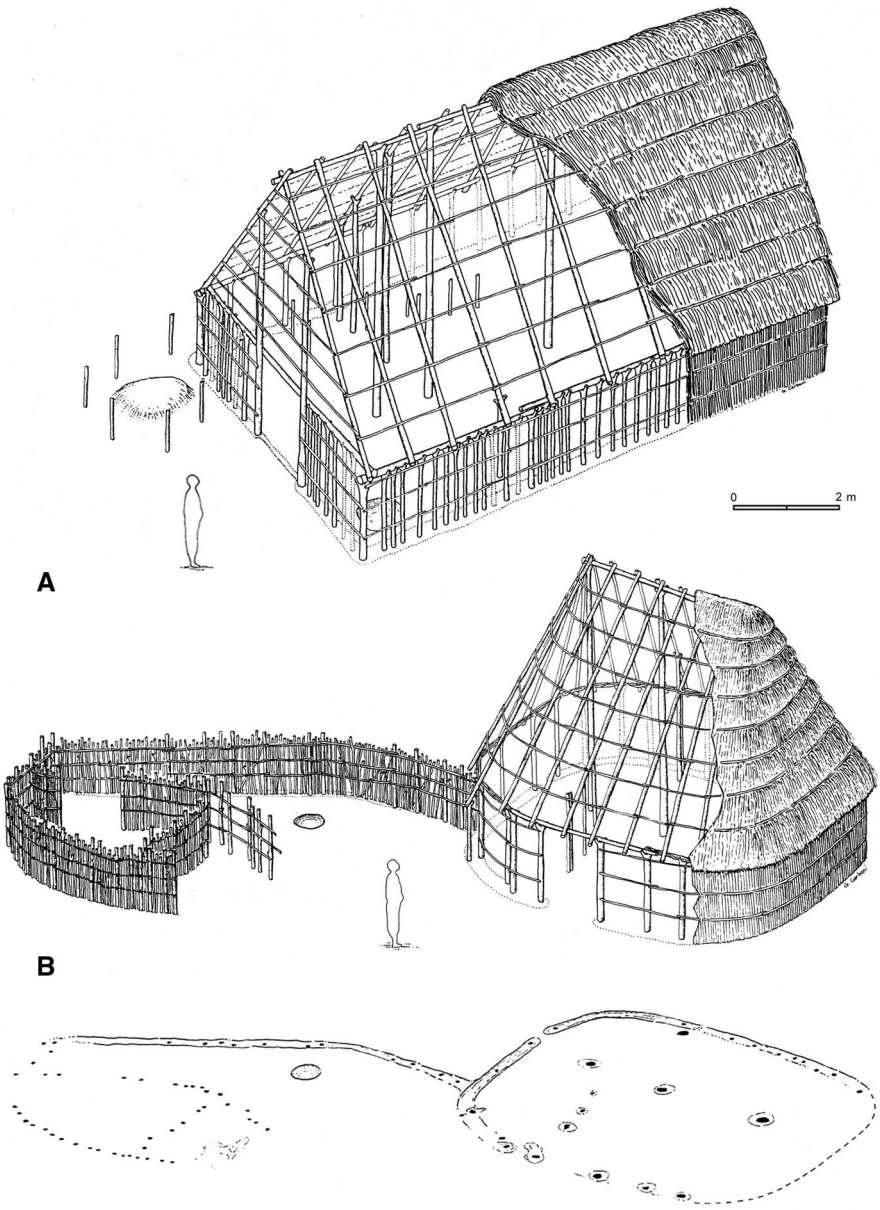

Fig. 3 Wattle-and-daub houses from Quadrato di Torre Spaccata, Rome. Many late Neolithic and Copper Age habitation sites consist of small clusters of houses, a far cry from the substantial nucleated villages of the early and middle Neolithic (Anzidei and Carboni 2007)

the archaeological footprint of smaller communities moving periodically to nearby unexploited soils (Gianni 1991; Moscoloni and Silvestrini 2005).

At face value, the evidence seems to point to a higher degree of continuity with the Neolithic economy and lifestyle than previously surmised. If we scratch the surface, however, clues soon emerge that there might be more to this than meets the eye. It has long been suggested that certain upland villages including Conelle and Ortucchio may be aggregation sites, in which scattered communities would gather seasonally to exchange livestock and goods, arrange marriages, and hunt red deer and wild boar during youth initiation rites (Robb 2007; Skeates 1997a). However, interpretation is complicated by the state of the evidence. At Conelle, for example, all cultural materials come from the ditch deposit, as the habitation layers were all but wiped out by plowing and erosion (Cazzella 1999). There might also be a hitherto underestimated chronological element to the changes in settlement patterns, with permanent villages becoming rarer in the late fifth and fourth millennia BC and growing again in the third millennium BC, possibly due to new farming technologies that enabled population growth (see below). This is something that future research and radiocarbon dating ought to clarify.

In central Italy, the Copper Age undoubtedly featured sustained colonization of previously marginal landscapes due to the combined effect of climate change, a cultural shift toward mobility and social fragmentation, and the introduction of new farming and breeding practices. Similar trends toward upland frequentation and forest clearance are evident, from the late fourth millennium BC, in the remainder of the peninsula (and indeed farther afield), thus indicating the systemic nature of the changes afoot (Broodbank 2013, pp. 306–309; Cremaschi et al. 2011). Those taking to the mountains relied on new subsistence strategies involving small-scale transhumance from winter lowland pastures to summer upland grazing areas. A host of upland cave stations in which bone profiles, micromorphology, and phytolith analysis all converge show that cattle and sheep/goats provided the economic and social foundations for specialized animal husbandry (Barker 1981; Barker and Grant 1991; Maggi 1997, 2002; Skeates 1997b). Evidence of winter camps is harder to come by, with the possible exception of Le Cerquete-Fianello, a lagoon-side village near Rome. Here, sheep and goat make up almost 60% of the bone sample, while cereal farming was not practiced on any significant scale. That the local economy narrowly depended upon a few domestic species is further suggested by the absence of fish and game; this is all the more surprising considering that the village sat in an environmental niche exceptionally rich in both (Manfredini 2002). However, interpretation is complicated by nontranshumant pigs in the bone assemblage (*c*. 20% of the NISP), compounded by significant preservation biases.

At most lowland and mid-altitude sites, cereal and pulse remains, as well as evidence of food storage and processing, indicate that the intensification of herding did not come at the expense of mixed farming (Skeates 2013). The implication is that the new regime may have required nothing but the short-range movement of herds in the inhabited landscape, or that only a fraction of the populace left for the mountains seasonally. Diversification of subsistence practices, rather than a single-minded move toward pastoralism, is what the data seem to indicate. Along with communities specializing in sheep and goat rearing (e.g., Quadrato di Torre Spaccata and Poggio

Olivastro; Anzidei and Carboni 1995, 2007; Bulgarelli et al. 1993), there were others relying more heavily on cattle (e.g., Piscina di Torre Spaccata, Querciola, and Casale del Dolce; Bietti Sestieri and Gianni 1984; Bistolfi and Muntoni 2000; Sarti 1997). A few villages intensified pig keeping, but always as part of diverse livestock management strategies comprising other domesticates as well (e.g., Conelle: Cazzella and Moscoloni 1999; Wilkens 2000).

Cattle were increasingly accumulated as a social valuable, enabling owners to build up and repay debts and obligations (Robb 2007, p. 146); with improved farming technologies they also were put to new uses. Plows and carts were introduced into Italy in the late fourth millennium BC (Heyd 2013). By the mid-third millennium BC, animal traction must have been sufficiently common to instigate far-reaching changes in agricultural practices. Heavy alluvial soils in the Arno plain (and presumably elsewhere) were first cultivated with wooden plows of the kind unearthed at Lavagnone near Lake Garda, dating to 2048–2010 cal. BC (De Marinis 2000, p. 196; Perini 1983). Bulk produce was now carried back to villages in wheeled vehicles running on the earliest purpose-built roads (Laforgia and Boenzi 2011; Saccoccio et al. 2013). By the same time domestic horses, first documented in the late fourth millennium BC, were employed for traction as much as oxen (e.g., at Querciola; Sarti 1997). Purely functionalist explanations, however, would miss the point that the new technologies and domestic animals had to be socialized before they could be integrated into the productive economy. Ritual provided a range of concepts and practices to ease the introduction of the novel and the strange, and to turn the dangerous into the tame. In Valcamonica (central Alps), plows and carts were added at this time to the rich symbolic repertoire of the local rock art (Casini 1994; Casini and Fossati 2013). At Saint-Martin-de-Corléans, a megalithic site in the western Alps, human teeth were sown into plowed furrows as part of a foundation rite echoed, many miles eastward and many centuries later, by the Argonauts' myth (Mezzena 1998). At Le Cerquete-Fianello (Rome), a domestic horse was skinned, defleshed, dismembered, and eventually buried in an elaborate ritual performance dictating use of a metal blade (Curci and Tagliacozzo 1994, 2002).

Such a broad suite of momentous, interrelated changes is traditionally ascribed to the "secondary products revolution." The concept was introduced by Sherratt (1981, 1983) to explain the dramatic changes in subsistence practices and settlement patterns that swept across Europe at this time. The model's success lies in its ability to provide a coherent socioeconomic explanation for the changing archaeological record. For example, milk boilers becoming more numerous from the late Neolithic indicates growing reliance on dairy products. Likewise, changes in spinning and weaving equipment signify a generalized shift from linen to wool, enabled by new breeds of woolly sheep from the Near East. Animal traction is another key innovation thought to date to this time, as well as the wheel; these, too, were part of the revolutionary material package made available to European society at this time (Broodbank 2013; Whittle 1996). There is no denying that this tangle of innovations and intensifications brought about major transformations in the prehistoric economy. Yet one wonders if this was the game changer that it frequently is assumed to be.

Recent research has shown that, in central Italy as much as farther afield, the Chalcolithic secondary products revolution was neither Chalcolithic nor a revolution

(Greenfield 2010). Firstly, the new economic regime developed gradually out of a spectrum of well-established Neolithic subsistence practices, and the change was cumulative rather than sudden. Secondly, bimodal butchery curves of sheep/goat and cattle (e.g., at Conelle, Le Cerquete-Fianello, and Casale del Dolce; Bistolfi and Muntoni 2000; Cazzella and Moscoloni 1999; Manfredini 2002) suggest that domestic animals continued to be valued for their meat as much as their milk, wool, and traction power. Thirdly, hunting made an unexpected comeback at a host of upland sites such as Conelle and Ortucchio (Wilkens 2000). Strong selective preference for red deer, a species depicted at multiple ritual locales throughout the peninsula (e.g., Grotta dei Cervi; Graziosi 1996), suggests that hunting was not always a mundane subsistence task but a symbolically laden activity, possibly undertaken during male initiation rites (Dolfini 2017; Whitehouse 1992a). However, the presence of different kinds of quarry (e.g., roe deer and wild boar) at lowland sites reminds us that ritual interpretations may not suit all contexts (Cocchi Genick 2009, p. 175). Whatever the correct reading in specific instances, the overall evidence indicates a staggered move toward diversified subsistence strategies rather than a blanket shift toward specialized pastoral economy. Taken together, the new data suggest that central Italian communities relied on a spectrum of economic resources not greatly dissimilar from those available in other regions of Europe. This view is different enough from previous interpretations focusing on the pastoral economy to warrant future research into changes in human mobility during 4500–2200 BC, how subsistence strategies were adapted to local environmental conditions, and what context-specific cultural responses did the new technologies and domesticates elicit in increasingly fragmented Copper Age society.

Connectivity and Exchange

Investigations of long-distance exchange in Neolithic Europe and the Mediterranean have overwhelmingly focused on three well-traceable materials: the spiky shells of *Spondylus gaederopus*, an oyster fished in the shallow waters of the Aegean and Adriatic Seas; igneous and metamorphic "greenstones" (mainly eclogite, omphacitite, and jadeitite) from high-altitude outcrops in the western Alps and northern Apennines; and obsidian, a black volcanic glass found at several island sources in the eastern and central Mediterranean (Robb and Farr 2005). Whereas the *Spondylus* and greenstone exchange networks largely bypassed the central Italian peninsula, the region was drawn into the sprawling web of the prehistoric obsidian trade.

Obsidian was used in the Neolithic for the manufacture of razor-sharp flakes and bladelets. Long-standing archaeological interest in this material is motivated by its traceability to four central Mediterranean island sources: Monte Arci in Sardinia, Lipari in the Aeolian archipelago, Palmarola off the coast of Latium, and remote Pantelleria in the Strait of Sicily. Chemical fingerprinting of obsidian from these sources (and from individual quarries at Lipari and Monte Arci) has enabled detailed reconstructions of the circulation patterns of this sought-after material (Ammerman 1985; Pessina and Radi 2005; Tykot 1998, 2017; Tykot and Ammerman 1997).

In the sixth millennium BC, roughed-out blocks and prepared cores from each source were moved to adjacent coastal sites, where they were reworked into preformed blanks and tools that were disseminated to a much wider area via combined maritime and overland exchange. Sicily, parts of southern Italy, and Malta obtained obsidian from the Lipari source. Western Sicily, coastal Tunisia, and Malta were drawn into the smaller exchange network of obsidian from Pantelleria. In the south-central peninsula up to the western and, to a lesser degree, eastern Adriatic shores, the obsidian came from Palmarola. The jet-black obsidian from Monte Arci was exchanged to Sardinia, Corsica, and large swathes of north-central Italy (Fig. 4). Distribution changed in the fifth millennium BC, when Sardinian and Lipari obsidian was exchanged farther and deeper into their respective circulation zones. By the end of the millennium, Lipari obsidian circulated all over the entire central Mediterranean from North Africa to the Alps, with obsidian from the other sources more restricted to increasingly self-contained spheres of exchange. This is especially true for Palmarola and Pantelleria obsidian, whose

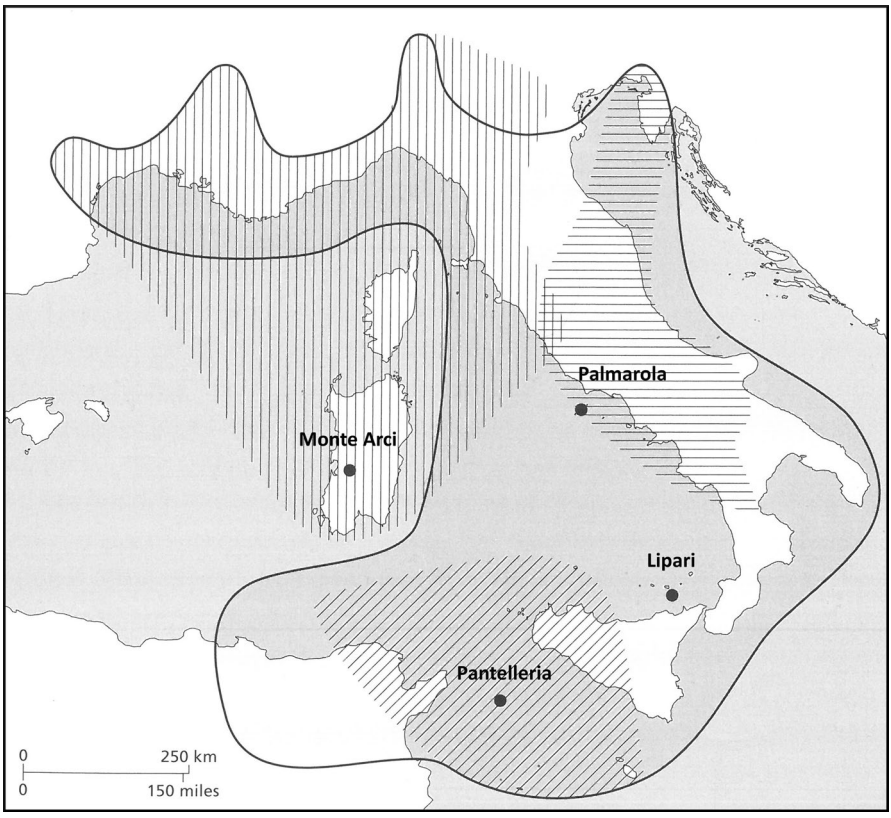

Fig. 4 Dispersal pattern of central Mediterranean obsidian, aggregated over time. By the turn of the fourth millennium BC, the exchange network of Lipari obsidian had grown to encompass most of the region at the expense of Monte Arci, Palmarola, and Pantelleria sources (modified after Broodbank 2013)

visual and mechanical properties could not compete with the shiny, eminently workable obsidian from the Lipari quarries (Pessina and Radi 2005; Robb and Farr 2005).

Targeted research has clarified the mechanisms of obsidian production and exchange. Evidence from coastal sites in Calabria, where Lipari obsidian makes up over 90% of the stone toolkit, suggests that people in this "interaction zone" accessed the source directly through seasonal maritime expeditions (Robb and Farr 2005). Farther away, however, the amount of Lipari obsidian progressively decreases to 10–30% of lithic assemblages. Prevalent coastal distribution patterns suggest that seagoing canoes shuttling back and forth from the direct procurement area were used to supply this "secondary contact zone." From there, the tools circulated down the line, mainly via terrestrial routes. Yet not all tools were traded in this manner. Obsidian-rich hotspots located hundreds of miles away from the quarries indicate that certain communities had preferential access to the material and, in turn, acted as regional brokers in their redistribution (Ammerman 2003; Ammerman and Polglase 1993; Pessina and Radi 2005). Furthermore, alternative procurement systems often coexisted side by side in the same area; in Late Neolithic Abruzzo, for example, Lipari obsidian clustered by the coastline, while Palmarola obsidian mostly reached inland communities. It is presumed that the latter moved over land from the Tyrrhenian Sea through the river valleys and mountain passes of southern Latium (Pessina and Tiné 2008, p. 239).

As interest has largely focused on the spatial and temporal dynamics of obsidian exchange, relatively little has been said apropos the social mechanisms underpinning it. It is frequently assumed that the prehistoric residents of Lipari must have controlled the quarries (e.g., Malone 1986 cited in Skeates 2013, p. 16). As proceeds from the "trade" soared during the fifth millennium BC, so did the risks of unfriendly visits from overseas. To fend them off, the bulk of the populace would have moved to the naturally defended Acropolis site, where, unperturbed, they continued to reap the benefits of an increasingly profitable business. Less modernist explanations have been proposed of late. Noting that trade in tribal societies is often conducted for the sake of the social relations created through it rather than for the mere procurement of commodities, Robb (2007) posited that the communities located in the interaction zone sought Lipari obsidian through seasonal visits. In his view, both Lipari dwellers and visitors engaged in cooperative quarrying, core preparation, and ostentatiously skilled knapping at coastal aggregation sites such as Contrada Diana. Feasting would have eased social interactions between visitors and locals; this is hinted at by the open-air hearths and grinding stones unearthed at Contrada Diana.

With so much research focused on obsidian, other materials and objects have received less attention. As Broodbank (2013, p. 229) perceptively noted, most materials sought by late Neolithic communities were sourced locally; the clay and temper used for domestic pottery are a case in point (Forte and Medeghini 2017). Other materials were displaced over 100–200 km, either because they were not available in the nearby landscape or because of the social value added by exchange. This is the case with high-quality flint from the Monti Lessini and the Gargano peninsula, basalts from northeast Sicily, diorite from Calabria, and, anticipating later trends,

red jasper and steatite from Liguria and Tuscany (Barfield 1999; Leighton and Dixon 1992; Pessina and Tiné 2008).

Two intertwined phenomena took place in the early fourth millennium BC: the crash of long-distance greenstone and obsidian exchange and, at the same time, a growing interest in different workable materials including, in central Italy, red jasper and steatite. Jasper is a silica-rich stone often containing high amounts of iron, hence its distinctive blood-red color; it is found in the ophiolithic complexes of Liguria and Tuscany, worked since the Paleolithic. It is only in the Copper Age, however, that demand for this material grew exponentially and quarrying reached levels unknown before, or since. At a Copper Age quarry in Valle Lagorara (Campana and Maggi 2002), jasper was extracted using diorite and basalt hammerstones, knapped on site into oval pressure-flaked blanks, and subsequently exchanged down the line. At domestic sites, the blanks were turned into bifacial barbed-and-tanged arrowheads and small daggers, presumably intended for hunting and warfare.

Steatite, or soapstone, has a high talc content that makes it an excellent carving material. Like jasper, it crops up in the ophiolithic complexes of Liguria and Tuscany, where it is found in colors varying from off white to green. Though utilized since the Early Neolithic, this stone became increasingly popular in the fourth millennium BC (Pessina and Tiné 2008). A Copper Age steatite workshop has been excavated at Pianaccia di Suvero in eastern Liguria. It is presently unclear if this was purely a workshop site, as the excavators believe (and is the case with the jasper quarries-cum-workshops from the region; Campana and Maggi 2002; Campana et al. 1998), or if the stone was worked by a settled village community. Whichever the case, excavations have ascertained that the soapstone was brought to the site from a yet unidentified quarry and was expertly turned into round beads, small pendants, and, in the mid/late third millennium BC, Beaker-style V-bored conical buttons. The stone was worked following standardized operational sequences. The blocks and nodules from the quarry were first roughed out, then perforated, and finally carved into shape, smoothed out, and polished. Lithic tools were utilized in the first and second step of the sequence, while metal blades were preferentially employed in the third (Gernone 1998). Although steatite circulation patterns have not been analyzed in detail, it appears that, as with jasper, artifacts made from this stone were exchanged over distances of 100–200 km from the production areas. Chert was extracted and worked in a similar manner at numerous sites along the eastern edge of the Apennines, as well as farther south (Skeates 2003; Tarantini and Galiberti 2011).

Obsidian continued to be in demand in the Copper Age, but only close to the sources. In the Aeolian archipelago and Sardinia, in particular, obsidian remained the principal knapping stone until the late Bronze Age. Farther afield, however, procurement of this material declined rapidly. Comparison of two residential sites in Rome's hinterland show this decline: Lipari and Palmarola obsidian make up 42% of the lithic assemblage at Late Neolithic Quadrato di Torre Spaccata (Anzidei and Carboni 1995), while at Copper Age Le Cerquete-Fianello, only three bladelets were recovered during extensive investigations (Manfredini 2002). This trend can be followed throughout the entire central Mediterranean region and is compounded by the equally rapid shrinking of greenstone exchange networks after 4000 BC (Cazzella

1994; Melis 2009; Vaquer 2006). As with the island sources of obsidian, high-altitude Alpine quarries continued to be visited in the Final Neolithic and Copper Age, but axe heads and other objects made from greenstone were now displaced within a 200 km radius. As their Europe-wide exchange network fizzled out, greenstone objects metamorphosed from value-laden symbolic artifacts into humble workaday tools (Pétrequin et al. 2008, p. 272; see Malta for a significant exception: Skeates 1995b). Obsidian likely underwent a similar transmutation in its social significance, perhaps outcompeted by a material of unprecedented surface shine: metal.

The Emergence of Metallurgy

A large band of Tyrrhenian Italy stretching from eastern Liguria to northern Latium (also extending into the northern Apennines) is home to some of the richest ore-mineral deposits in Europe. From late fifth to late third millennia BC, copper, silver, and antimony were extracted from theses ores. Copper is found as a native metal and also was extracted from iron-copper sulfides (e.g., chalcopyrite, bornite), sulfosalts (e.g., tetrahedrite and tennantite), and oxides/carbonates (e.g., malachite and azurite). Silver was reduced from argentiferous "dry ores" (e.g., cerargyte and fahlores), lead compounds (e.g., galena and cerussite), and perhaps sourced as native silver. Antimony was extracted from a sulfidic ore called stibnite. Cassiterite (tinstone) deposits are known in Tuscany, but it is unclear if they were ever exploited in prehistoric times (Giardino 1998, pp. 134–135). Similarly, it is doubtful if the arsenic and iron-arsenic sulfides (e.g., arsenopyrite, orpiment, and realgar) that occur in small concentrations throughout the region were mined at this time to make arsenical copper. Several scholars suggest that this early alloy may have been obtained from the smelting of arsenic-rich copper minerals such as tennantite (Craddock 1995, p. 289; Killick 2014), which fits the central Italian evidence rather well (Dolfini 2014). Important nonmetallic minerals also are present in the region, including cinnabar, a blood-red mercury compound sought in prehistory as a pigment. Ore deposits do not extend east of the Apennines or south of the Tiber Valley due to the different geological history of these areas (Carobbi and Rodolico 1976; Cavinato 1964; Lotti 1910).

After a long period of stasis in the 1980s and 1990s, interest in the beginnings of copper mining, smelting, and working in central Italy has surged recently (Dolfini 2013a). The new research agenda has focused on two long-standing problems: the chronology of early metalworking and objects, and early copper-alloy technology and exchange. Dramatic developments in both subjects have disproved deeply held views and misconceptions, leading to important new insights into the evolution, transmission, and social significance of early metallurgy, as outlined below.

The Chronology of Early Metalworking in Central Italy

For most of the 20th century, the origins of central Italian metallurgy were framed by two competing metanarratives: diffusion and independent development (Roberts

et al. 2009). Following the migrationist paradigm prevailing at the time, early culture historians maintained that newcomers from either the eastern Mediterranean or the Balkans introduced copper technology into Italy. These scholars saw the Chalcolithic migrants not as peaceful settlers but as warring nomadic shepherds who conquered the local Neolithic farmers thanks to their superior metal weapons (Laviosa Zambotti 1943; Peet 1909; Puglisi 1959; Trump 1966). Barker (1971, 1981) and Renfrew and Whitehouse (1974), among others, rebutted early diffusionist models. They stressed the local character of early Italian metalworking, whose impressive florescence they credited to a combination of local advances and information exchange with areas of earlier metal production. In the same years, fine-grained chronologies were first put forward to date early metal axe heads, daggers, and halberds based on empirically constructed typologies. These, however, were not underpinned by formalized seriation sequences or radiocarbon (Bianco Peroni 1994; Carancini 1993; Peroni 1971).

Due to the speculative nature of the typological work, the evidence was pulled in two opposite directions. On the one hand, several prehistorians divided early central Italian metals into two clear-cut horizons marked by specific object types. They controversially assigned the first horizon to the advanced Copper Age (c. 3000–2200 BC) and the second to the initial Early Bronze Age (c. 2200–2000 BC) (Carancini 1993, 2001; Peroni 1996). To account for the objects occasionally found at earlier sites, they posited that a protracted phase with "incipient metallurgy," fed by occasional imports from the northern Alps and the Balkans, preceded the first metallurgical horizon (Carancini 2001, p. 236). A similar, if slightly backdated chronology was later proposed by De Marinis (2006); this was widely accepted until recently (Strahm 2007; Strahm and Hauptmann 2009).

On the other hand, a minority group of researchers claimed that the origins of Italian metallurgy were rooted in local Neolithic practices. Barfield (1966, 1996), in particular, assigned certain archaic-looking axe heads to the Middle Neolithic, while Skeates (1993) and Pearce (2007) took a more cautious approach, arguing for the (mainly) Late Neolithic origins of Italian metallurgy. Because few radiocarbon dates were available at the time, the problem was largely left unresolved, and a consensus of sorts coalesced around two notions. The first postulated that metallurgical knowledge was introduced into central Italy significantly later than in the northern Alps and Sardinia. The second maintained that early metals from the region could typologically, and perhaps technologically, be divided into two clear-cut horizons; first, the Middle/Late Copper Age and, second, the Late Copper Age and Early Bronze Age. Italy was thus consigned to the limbo of areas that, in accounts of the origins of world metallurgy, were rarely mentioned due to their perceived role as centers of secondary development (Dolfini 2013b).

Recent research has dramatically disproved both notions and has clarified the overall developmental sequence of early metal technology in the region. Radiocarbon dating of metal-rich chamber graves and funerary caves provided the most striking results (Anzidei et al. 2011a, 2012; Dolfini 2010; Manfredini et al. 2009; Petitti et al. 2011). These showed that the chronology built by the typologists of old was at odds with the historical realities of early Italian metal making. Objects that were previously thought to be Late Copper Age turned out to be Final Neolithic,

and objects once dated to the Early Bronze Age were newly assigned to the Early Copper Age. In a few instances, whole classes of artifacts were shown to be 1000 years older than previously believed, and perhaps older still. While many radiocarbon dates cluster in the Early Copper Age, none fall squarely in the Early Bronze Age, proving that central Italian metallurgy is neither late nor necessarily derivative. The new chronology has, in fact, aligned the onset of metallurgy in this region with the northern Alps and Sardinia, highlighting previously unsuspected instances of rapid knowledge exchange over remarkable distances (Dolfini 2013b). Radiocarbon has also shown that ternary copper-arsenic-antimony alloys, previously thought to reflect a late technological horizon (De Marinis 2006), were mastered from the mid-fourth millennium BC alongside pure and arsenical copper. This demonstrates the sophistication reached by central Italian smiths at the dawn of metal production.

Overall, the new research has revealed that copper, silver, and antimony metallurgy began in earnest in the Early Copper Age (3600–3300 BC), following sustained experimentation (limited to copper) in the Late Neolithic (4500?–3800 BC) and Final Neolithic intensification (3800–3600 BC). Metallurgical knowledge was likely introduced from the western Balkans via the eastern Alps and northern Italy (Dolfini 2013b). Awls and axe heads were the first objects made from copper in central Italy; they overall date to the Late Neolithic and not the Middle Neolithic as was once proposed (Dolfini 2013c). Smelting slags found at Orti Bottagone, an early fourth millennium BC site in Tuscany, suggests that objects were manufactured in the region using locally sourced copper (Artioli et al. 2007; Fedeli and Galiberti 2016, p. 147), disproving earlier suggestions that Neolithic metallurgy relied on imports from farther away. Possible slags and crucibles from Botteghino (northern Italy) may push the onset of extractive metallurgy south of the Alps farther back in time, pending the necessary scientific analysis (Mazzieri and Dal Santo 2007).

Metal production surged in the mid-fourth millennium BC. By this time, central Italian smiths had mastered all steps of the *chaîne opératoire* of copper extraction, enabling them to fashion several types of axe heads, daggers, and halberds using pure and arsenical copper (Dolfini 2010, 2013b, 2014). An important component of this technological intensification was the application of extractive metallurgy to ores other than copper, including silver and antimony. This is one of the earliest instances of antimony extraction in world history. This metal was likely discovered independently in Tuscany (where stibnite ores abound) through a trial-and-error process involving the adaptation of copper-smelting technology to a different ore. Silver and antimony were used to cast several types of ornamental beads. Importantly, the mid-fourth millennium technological outburst was accompanied by crucial developments in the signification of metals, which first entered the funerary domain as markers of gender, age, and perhaps status (see below).

Metal production seemingly varied little until the mid-third millennium BC. The earliest objects containing appreciable amounts of tin—a ring from Poggio Olivastro and a bead from Prima Ciappa—date to this time (Bulgarelli and Giumlia-Mair 2008; Campana et al. 1996). Arsenic and other impurities revealed by chemical analysis suggest that these objects were probably obtained from smelted copper-tin ores (e.g., stannite) rather than by adding metallic tin to the copper melt. This would be in line with Copper Age metallurgical practices in the region, featuring ore selection

rather than alloying to obtain the desired metallic substances. Moreover, these isolated objects predate the development of tin-bronze technology in Western Europe from 2300/2200 BC (Pare 2000).

It is presently unclear when exactly tin-bronze technology was introduced into central Italy and where the tin came from. In their study of early metal flows in the Alpine region, Perucchetti et al. (2015) showed that tin appeared in the western Alps earlier than farther east, perhaps coming from southwest Britain around 2200–2000 BC. According to De Marinis (2006), during the initial Early Bronze Age, central Italian smiths still relied on arsenical and arsenical/antimonial alloys, with tin-bronze technology emerging after 2000 BC. He argues that the two technologies then coexisted for a while, until tin bronzes became exclusive from 1800/1700 BC (see also Pare 2000; Spindler 1971). Although the technological sequence described by De Marinis seems correct overall, it is nonetheless grounded in an outdated chronological framework that assigns many Copper Age metals to the Early Bronze Age (see above). Considering the overall backdating of early metalwork discussed above, it is likely that the entire sequence should be shifted back some two centuries, aligning central Italy with the western Alps (Dolfini 2010). Currently, this is an open question that should be targeted in future investigations.

Early Copper Technology and Metalwork Exchange

Recent interdisciplinary research has clarified aspects of the *chaîne opératoire* of copper extraction, working, and exchange. At two copper mines in Liguria—Libiola and Monte Loreto—chalcopyrite (presumably supplemented by now-depleted surface deposits of copper oxides/carbonates) was extracted through underground working and tunneling, aided by fire to loosen the rock face. The copper minerals were crushed outside the mine with basalt hammerstones, then hand sorted to separate the ore from the gangue (but not smelted on site). Once a vein was exhausted, miners backfilled the gallery, perhaps urged by cultural preoccupations. Radiocarbon dating has pinpointed the inception of ore mining at both Libiola and Monte Loreto to the mid-fourth millennium BC (Maggi and Pearce, 2005; Pearce, 2007, pp. 62–70); this dovetails with the metallurgical surge discussed above. Further evidence of early ore-mineral extraction is present at Buca di Spaccasasso and Poggio Malinverno; the former is a third millennium BC cinnabar quarry where burial was also performed, while the latter is presently undated (Cavanna and Pellegrini 2007; Giardino and Steiniger 2011; Volante 2014). If considered with the historic evidence (e.g., Aranguren and Sozzi 2006; Cocchi Genick and Grifoni Cremonesi 1989; Mochi 1915), these discoveries greatly strengthen the case for the antiquity and scale of prehistoric mining in west-central Italy.

New excavations and scientific analysis have also increased our knowledge of early smelting technology. Excavations at San Carlo-Cava Solvay, a now-destroyed domestic site in Tuscany (Fedeli and Galiberti 2016), brought to light several fired-clay platforms partly surrounded by curvilineal limestone walls. These are similar to early smelting installations in southern France and the eastern Alps (Ambert et al. 2005, 2013; Perini 1992). The analysis of slags and crucibles from the site

has revealed that copper and iron-copper compounds, some containing appreciable amounts of arsenic and zinc, were co-smelted on the platforms using a surprisingly efficient reduction technology. The smelting charges variously comprised chalcopyrite, sulfosalts (e.g., tetrahedrite and tennantite), and copper oxides/carbonates (e.g., cuprite); these were reduced in crucibles heated from above by blowpipes and/or bellows (Artioli et al. 2016). The process led to the formation of well-reacted silica slags lacking the unreacted ore fragments and entrapped copper droplets typical of early metallurgical residues (Bourgarit 2007). This is all the more remarkable considering the late fourth millennium chronology of San Carlo-Cava Solvay, which makes it one of the earliest metallurgical sites in Europe. Future research will clarify if this technological leap is unique to this settlement, or whether it is shared by other early smelting sites in the region.

Although the smelting evidence, and most metalwork, cluster near the ore deposits of west-central Italy, alleged casting and working residues have been found all over the region, including in resource-starved Marche and Abruzzo (Dolfini 2014). Many of these residues, however, are difficult to assess due to the lack of targeted scientific analysis. Some look like genuine casting scraps (e.g., at Conelle; Palmieri and Cazzella 1999, fig. 48.4); others, however, might be highly fragmented and eroded objects (e.g., at Querciola and Maddalena di Muccia; Manfredini et al. 2005b; Sarti 1997). Whatever the case, metal waste of this kind offers much-needed clues that copper circulated well beyond the extraction zones of Tuscany and Liguria. Multiple strands of evidence support this reading. For example, bone artifacts from Conelle, a Copper Age site in Marche, were carved into shape using metal tools (Cristiani and Alhaique 2005); yet these tools are nowhere to be found, except for a single nondescript knife (Palmieri and Cazzella 1999, fig. 48.3). More generally, metal objects are extremely rare in east-central Italy including at burial sites that, west of the Apennines, teem with copper-alloy weapons. A major visibility bias is in operation here, probably caused by widespread copper recycling as well as divergent social behaviors that dictated the placing of metals with the dead in the western and eastern peninsula (Lemorini 2012; Pearce 2009).

Recent applications of lead isotope analysis—a not uncontroversial provenancing method (Pernicka 2014; Radivojević et al. 2019)—have provided yet more inklings as to the wide circulation of early metals and how visibility biases may obscure it. The technique was applied to the axe head carried by the Iceman, a late fourth millennium BC mummy from the eastern Alps, and a coeval (and typologically similar) implement from Zug-Riedmatt, Switzerland. The analyses revealed that both objects were made from copper likely sourced in the Colline Metallifere ("Ore Mountains"), a conspicuous ore body in Tuscany (Artioli et al. 2017; Gross et al. 2017). Orti Bottagone and San Carlo-Cava Solvay lie in this area. Recent lead isotope analysis of 20 axe heads and daggers from central Italy (Dolfini et al., in press) shows that while most objects were fashioned from metal from Tuscany, others were made from copper whose isotopic signal points to the western Alps and southern France. Occasionally, metals came from farther away, such as an axe head from Rome's hinterland, whose Levantine shape and Cycladic isotopic fingerprint suggest an eastern Mediterranean origin (Anzidei et al. 2018). Considering the abundance of cupriferous ores in Tuscany, such instances of "bringing coals to Newcastle" open

up unexpected scenarios regarding early metalwork circulation, which only future research can elucidate.

The objects themselves provide a great deal of information concerning early metal technology. Giardino (2009–2012) observed patterns of wrinkles stretching along the vertical axis of two late Neolithic axe heads, as well as, in one specimen, congealed copper droplets (caused by the mold cracking under thermal stress) running downward from the butt (Fig. 5). Both features, which he reproduced experimentally, demonstrate use of bivalve molds at the very inception of copper metallurgy. The wear analysis of 48 Copper Age axe heads, daggers, and halberds further suggests early use of bivalve molds in the region (Dolfini 2011; Iaia and Dolfini, in press). The research highlights several features that are incompatible with one-piece molding including, in axe heads, hollowed-out faces and blowholes (on both sides) caused by trapped gases; v-shaped shrinkages on axe butts due to insufficient quantities of metal being poured in; and, in bladed implements, symmetrical

Fig. 5 Late Neolithic copper-alloy axe head from Rapolano, Siena. Congealed droplets running down from the butt suggest that this object was cast in a bivalve mold, indicating knowledge of two-piece casting since the very beginning of metal production (photograph reproduced by courtesy of the Museo delle Civiltà 'L. Pigorini,' Rome)

midribs. Objects cast in monovalve molds (as suggested by marked asymmetries in object profiles) are present in the sample but not in great numbers. This goes against received wisdom postulating that "more advanced" bivalve molds followed early experimentation with "simpler" monovalve ones. Emphatically, the data show that this is not the case, for two-piece and one-piece molds were used side by side in early central Italy, the former not just predating but also greatly outnumbering the latter (Dolfini 2011; Iaia and Dolfini, in press). Similar patterns are found in other areas of early Europe (Crellin 2018; Kienlin 2010; Kuijpers 2018).

Wear analysis has shown, moreover, that evidence of shaping and smithing may be discerned on axe heads in the form of thickened or flattened margins, raised flanges, and bevels between axe bodies and cutting edges. Hammer marks also were observed on the cutting edges of certain axes, suggesting work-hardening prior to use. Work-hardening poses a much-debated problem in early European metallurgy, one that intersects notions of technological evolution, skill, and knowledge transfer. It is generally presumed that prehistoric copper-alloy tools were hardened to lengthen their use life and increase their performance. While the procedure was routinely deployed in the Bronze Age, it is presently unclear when, and how consistently, it was performed prior to that. Scientific analyses suggest that, in the northern Alps, early axe heads were frequently hardened, while in the southern Alps Copper Age smiths were either unaware or mostly uninterested in enhancing tool functionality through hammering (Artioli 2007; Kienlin 2008, 2010). Recently, Kuijpers (2018) has argued that the problem needs retheorizing, for performance is a cultural concept that stems from contingent factors, including alloy composition and "the standard of the time" or the technological baseline to which smiths and users refer in judging the quality of a tool. While the problem cannot be solved with regard to central Italian metals pending further analyses, the coexistence of monovalve and bivalve molds disprove long-standing ideas of linear technological change, which might apply to work-hardening, too. The new research shows that different communities of practice adapted technical knowledge to the specific social and material conditions in which they operated, and that an array of factors including the skill and experience of the coppersmith contributed to determining the quality of the finished objects.

Funerary Practices and Ideas of the Body

For much of the Italian Neolithic, the village acted as a cultural pivot for the daily enactment of social relations and the reproduction of individual and collective identity. Burial was mostly performed in domestic contexts: under house floors, in pits and trenches scattered across settlement sites, and, significantly, in ditches marking the symbolic boundaries of village communities (Robb 2002, 2007). Things began to change in the fifth millennium BC, when the dead were first interred at distinct locales within the village, signifying separation from daily life. At the same time, mortuary rites grew more formalized and featured increasingly elaborate bone manipulation, fragmentation, and reburial customs (Dolfini 2015).

The beginning of this long-term trajectory can be traced back to the advanced Middle Neolithic, when, in southern Italy, discrete burial grounds were first established at the edge of inhabited or recently abandoned villages (Conati Barbaro 2007–2008). The trend toward burial segregation gained momentum in the late Neolithic, as seen for example in the extramural cemeteries of Masseria Bellavista, Scoglio del Tonno, and Cala Tramontana (Palma di Cesnola 1967; Quagliati 1906). These sites display frequent reorganized burials and standardized grave goods, anticipating widespread Copper Age features. As a further intimation of things to come, hypogeal burial chambers appeared at this time at Arnesano, Serra d'Alto-Fondo Gravela, and perhaps Scoglio del Tonno (Manfredini 2001; but see Pessina and Tiné 2008, pp. 289–291, for problems of interpretation).

In central Italy, key evidence for fast-changing ideas of the dead comes from Ripoli (Cremonesi 1965), where the Late Neolithic village featured a discrete burial ground consisting of nine trenches that cut across the inhabited space. The exact layout of these burials is unclear, however, as they were investigated in the early 1900s (Rellini 1934). At least 44 individuals were interred in the Ripoli trenches, varying from one to 14 per feature. Skeates (1995a) maintains that the mourners first placed a body in the grave; they would then leave the grave open to allow the soft tissues to decompose. After some time, they would return to the grave to manipulate the dry bones and carry out funerary feasts whose conspicuous remains characterize many burials at the site. However, Grifoni Cremonesi (2003a, p. 266) pointed out that any reconstruction of the burial process at Ripoli is hampered by the scant evidence available. Alongside open settlements, caves were used in the Late Neolithic for funerary practices, especially in the Apennine uplands. Even at these sites, however, burial and ancestor veneration rituals were progressively moved into the deeper recesses, away from the cave mouths where domestic life concentrated (Skeates 1997b; Whitehouse 1992a). This is most apparent at Grotta dei Piccioni, where inhumation, skull curation, and other ritual performances were carried out in a secluded space at the bottom of the cave (Cremonesi 1976).

The lengthy process of separating the dead from the living ended in the Final Neolithic and Copper Age. Burial was moved out of the domestic space, and cemeteries were created in the landscape as separate and often secluded locales for the performance of funerary rites. At the same time, mortuary practices acquired an increasingly formulaic character, to the point that funerary customs shared recurrent traits over large, if not necessarily bounded areas. Two such customs characterize central Italy in the fourth and third millennia BC: interment in caves, the Vecchiano tradition, and burial in hypogeal chambers (occasionally supplemented by trench and cist tombs), the Rinaldone tradition. The former concentrates along the Tyrrhenian coast and in inner Tuscany and upland Abruzzo, while the latter clusters in southern Tuscany/northern Latium, the lower Tiber Valley, and the Adriatic lowlands. In Rome's hinterland, Rinaldone burials interdigitate with cemeteries in the Gaudo and Laterza styles that characterize the southwestern and southeastern peninsula, respectively. Gaudo burials feature hypogeal chambers similar to Rinaldone's (but the goods and mortuary rites are partly different), while Laterza cemeteries consist of individual trench burials (Anzidei et al. 2011a, b, 2012; Cocchi Genick 2009; Negroni Catacchio 2006). Burial continued to be performed at open

villages during the Copper Age, but evidence is so scant and indistinctive to give us the impression that this was not a significant countertrend to what was going on in the broader landscape.

Most burial caves are poorly known due to infrequent modern excavations and high rates of looting. It is presumed that, at most places, mortuary rites began with the inhumation of articulated bodies followed by the manipulation and fragmentation of the dry bones. The archaeological outcomes of these processes, whose taphonomy may be exceptionally hard to disentangle, are thick deposits in which large amounts of bone fragments are mingled with potsherds, dismembered necklaces, and stone and metal weapons. Burial caves were used by communities ranging from a single lineage (e.g., Prima Ciappa; Maggi and Formicola 1978) to large coresidential groups (e.g., Grotta San Giuseppe and Grotta del Fontino; Cremonesi 2001; Vigliardi 2002). Radiocarbon shows that many of these sites remained in use for centuries.

The Rinaldone burial tradition is typified by small cemeteries, seldom exceeding 20 graves, organized in clusters of low-ceilinged, subterranean chambers cut in the soft tufa or limestone bedrock. Entrance shafts or short corridors precede the tombs, which normally included a small number of individuals, both articulated and reorganized. Women, men, and children of all age groups were afforded formal burial, although infants and young children are absent or significantly underrepresented at all but a handful of sites. More often than not, articulated bodies were placed, legs flexed, on their left sides regardless of gender, while dismembered remains were carefully arranged along the chamber walls or near the entrance (Fig. 6). However, variation is high both within and between sites, thus suggesting that mortuary behavior was predicated upon an array of context-specific customs and conventions (Dolfini 2006a).

Gender and age were frequently stressed in articulated burials through recurrent sets of goods. Typically, weapons were placed with men, while ornaments such as composite necklaces and pins accompanied women and children. Copper-alloy awls, whose lifetime function and funerary uses are still debated (Pearce 2007, pp. 48–50), were given to all gender and age groups, as were bottles and flasks containing an intoxicating drink akin to mead (Carboni et al. 2015). To some extent, gender and age also were expressed through bodily layout. In Copper Age burials, however, the focus was not on orientation (as in the Neolithic) but on manipulation, or lack thereof, as male skeletons remained articulated more often than those of women and children (Dolfini 2006a, b).

An unprecedented degree of ritual elaboration characterized Copper Age mortuary practices. Evidence from Rinaldone-style chamber graves, albeit not uniform, suggests that the burial process encompassed three main steps: interment of a fleshed (and often furnished) individual, flexed sideways; manipulation of the dry bones, which were removed, partly or totally, from the grave and probably recirculated among the living; and reburial of selected remains (normally skulls and long bones), which were mixed with ancestral bones and stacked along the tomb walls or near the entrance (Table 2). This echoes the tripartite structure of rites of passage discussed by Van Gennep (1909), comprising rites of separation of the dead from the living; rites of liminality marking the transition to their new

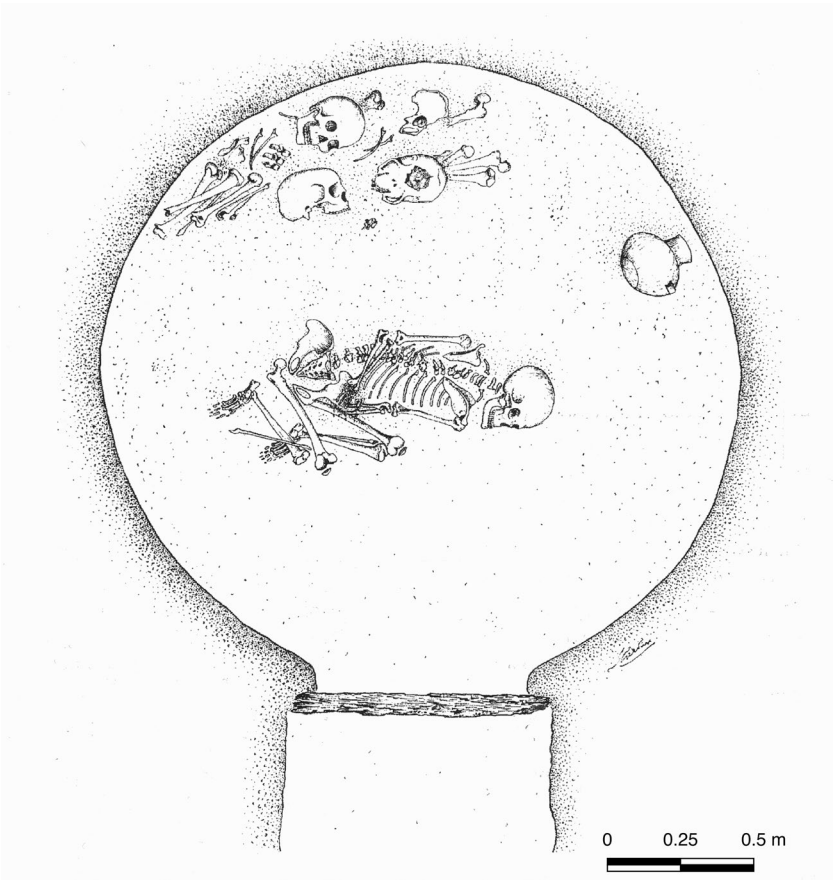

Fig. 6 Articulated burial and dismembered human remains from Ponte San Pietro, tomb 22. The chamber tomb is typical of the Rinaldone burial custom that arose in central Italy during the fourth millennium BC (Miari 1995)

state; and rites of incorporation sanctioning their final integration into the world of the dead. In Copper Age funerals the intermediate step (i.e., Van Gennep's rites of liminality) was especially elaborate. This featured an astonishing variety of bone manipulation practices ranging from the removal of the skull to the complete disarticulation of the skeleton. Objects also were removed from the grave to be circulated and sometimes redeposited with disarticulated burials. This is especially true of the drinking vessel accompanying the deceased. The vessel was broken up as the skeleton was reorganized, and its fragments were presumably distributed among the living along with body parts. Eventually, select potsherds and bones were returned to the grave to mark the end of the burial process and the incorporation of the deceased into the realm of the ancestors. In burial caves, bodily fragmentation took a more extreme form than in chamber tombs, for the

Table 2 The funerary program deployed in Copper Age chamber tombs entailed three main steps: interment, manipulation, and reburial

	INTERMENT	MANIPULATION	REBURIAL
TIME ↓	TIME →		
	Interment of an articulated body, crouched on the left-hand or right-hand side	Manipulation or removal of the skull	Reburial of the skull
	Interment of further articulated bodies	Manipulation or removal of the upper body; the lower limbs are left in situ	Reburial of the upper body, reorganized
		Manipulation or removal of skull and limbs; spine/ribs (and occasionally feet) are left in situ	Reburial of the entire body, reorganized
		Manipulation or removal of the entire body; tiny bone fragments are (unintentionally?) left in situ	Reburial of the entire body, reorganized and mixed with other bodies
			Reburial of the long bones and skulls of several bodies, stacked together

As in Van Gennep's (1909) cross-cultural examination of rites of passage, the intermediate step (or 'rites of liminality') may be especially elaborate and long lasting (Dolfini 2015)

bones of the dead were systematically broken and mixed with ancestral relics, until no recognizable human form could be discerned in the commingled deposit.

Despite much local variation, the widespread occurrence of this tripartite burial custom suggests that Copper Age mortuary practices aimed to remove the individual identity and lifetime persona of the deceased. This process would have ensured that the newly dead was integrated into a nonindividualized community of the ancestors (Cocchi Genick 2004; Dolfini 2004; Skeates 1995a). As a counterpoint to this prevalent practice, however, certain bodies were left undisturbed in the grave. Significantly, their goods were left beside them, untouched, and their funerary vessels were not broken.

To understand this minority burial custom, we turn to another medium of bodily representation found in central Italy at the time: stelae. Anthropomorphic statuary emerged in many regions of Europe during the fourth and third millennia BC (Robb 2008, 2009), including Lunigiana, a mountainous area straddling present-day Tuscany and Liguria. Lunigiana stelae depict the human body in a formulaic manner. Body features include flexed arms with fingered hands, a horizontal line standing for the shoulders, and nonindividualized faces with straight noses, round faces, and, occasionally, two circles on either side of the head, presumably indicating ears or earrings. The lower body is never engraved. The head was carved into two alternative styles. The Pontevecchio style features short hemispherical heads directly attached to the torso; the Malgrate style presents peculiar crescent-shaped heads joined to the shoulders by carved-out necks (Fig. 7). As the two head designs occur in different areas of Lunigiana, their visual differences might have marked out distinct tribal identities (De Marinis 1995; Maggi 2001).

It appears that the Lunigiana stelae stood aligned in the open landscape, away from habitation or burial sites. They might have been erected along transit routes leading to mountain passes or high-altitude pastures, which gained economic and social relevance in the fourth and third millennia BC (see above). At Pontevecchio,

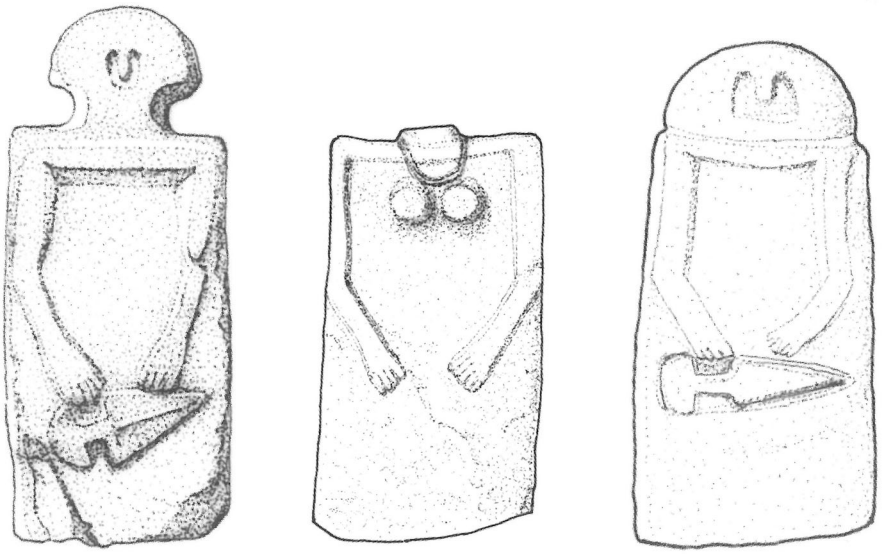

Fig. 7 Selection of Lunigiana stelae: left, Malgrate type, male; center, Malgrate type, female; right, Pontevecchio type, male. Note the gender markers, namely daggers (phallus-like, on the hips) for the males and breasts and necklaces for the females. Approximate height of complete stelae is 120 cm (modified after Cocchi Genick 2004)

a row of eight stelae were uncovered in the early 20th century (Mazzini 1909), and there are later discoveries from Minucciano (Ambrosi and Mannoni 1972). Alignments of stelae presumably acted as foci for ritual performances. Although no quality contextual data are available for stela sites in Lunigiana, recent findings from Ossimo-Anvoia (south-central Alps) provide much-needed clues to the cultural activities performed at such locales. Ossimo-Anvoia consists of a small mountainside plateau rising 860 m above sea level. The site was visited for about 1000 years, from the late fourth to the late third millennium BC, for ritual performances focusing on the erection, modification, and removal of anthropomorphic stelae and monoliths. Culturally significant artifacts were deposited near the stelae, including unusual natural stones, fossils, pottery, arrowheads, and scatters of fire-altered human remains (Fedele 2004, 2008). Like Fosso Conicchio, the site was seemingly devoted to the processing of human remains during the liminal stage of the burial process, when the bones were removed from the grave and circulated among the living. This practice would have reinforced the cultural bonds tying together the living and the newly dead and secured their transformation into ancestors.

Insights into the cultural logic underpinning Copper Age bodies, both real and imagined, are provided by the diacritic signs defining personal identity on stelae and in articulated burials. The first is gender, which was expressed in a dichotomized form that differs from the more fluid representations of gender typical of Neolithic Italy (Robb 1994a, 2007; Whitehouse 1992b, 2001). In both stelae and burials, maleness is denoted through weapons, while femaleness is expressed through ornaments, especially necklaces. The second is age. As well as being gender-specific,

the grave goods placed with articulated burials are also age-specific, as weapons and other markers of adulthood never accompany individuals under 11–12 years of age (Dolfini 2006a, b). Small stelae lacking breasts or weapons, often taken to indicate children, may mirror this funerary behavior (De Marinis 1995, p. 199; Robb 2009, p. 175). The third is the substances of the body. It is no coincidence that stelae where engraved in stone, as this material has distinctive physical and temporal properties such as endurance and immutability (Robb 2009). Stone was likely used in this context to emphasize a culturally constructed opposition between the living and the dead. Once again, this is something we encounter in burials, where ancestral bodies are defined by the hard, dry bones resulting from the decay of living (or transitioning) fleshed bodies. Stone may have stood for what the ancestors were made of (Bradley 1991, 2012; Parker Pearson and Ramilisonina 1998). Building on these considerations, I argue that the stone people should be interpreted as "special" ancestors, singled out by the living for distinct acts of remembrance. A similar practice was carried out at burial places by preserving the bodily integrity and furnishings of select deceased.

It appears that, in Copper Age central Italy, the dead could be channeled into two alternative pathways based on their personal identity, the circumstances of their death, and other factors that may no longer be discernible to us. The more common of the two—disarticulation—would have secured their integration into the undifferentiated realm of the collective ancestors; articulation, on the other hand, was reserved for select deceased whose life, death, or identity dictated singular, and perhaps individualized, commemoration.

Understanding Late Neolithic and Copper Age Society in Central Italy

Prevailing scholarly narratives maintain that three intertwined changes in central Italian settlement and subsistence strategies occurred during 4500–2200 BC: the breakup of the long-lived nucleated village, the colonization of marginal landscapes, and the onset of more diversified economic practices grounded in mobile herding. Since the fall of early migrationist theories, these changes have alternatively been explained as an unintended "snowball" effect caused by population growth (Barker 1981, p. 158) or a response to drier and more unpredictable climatic regimes (Broodbank 2013, pp. 264–265). Social explanations have also been proposed that focus on the ethics of reciprocity engendered by meat consumption. This is conceptualized as a potent expression of intergroup relatedness, which would have intensified at a critical juncture marked by the stretching of social networks over a wider, less permanently settled landscape (Robb 2007, pp. 311–313).

In this review, I have nuanced this picture by showing that the change was less abrupt than previously surmised and that significant elements of continuity existed with earlier settlement patterns and economic regimes. I also have highlighted a plethora of regional differences that were likely motivated by distinctive social choices as well as environmental constraints. Within a broader trajectory toward more fragmented village communities, presumably breaking up along descent lines, one can discern a minority countertrend, which is especially visible in the fertile

lowlands and alluvial plains. There, new productivity-boosting farming technologies allowed communities to stave off the growing risks of crop failure. It was, therefore, possible for them to dwell in large permanent settlements, which—and this is hardly a coincidence—reappeared in prehistoric Italy in the third millennium BC, following the widespread adoption of the plow and cart. Animal husbandry data display similar countertrends. For any community that intensified mobile herding, and set the mountains ablaze in the process, there were many others that took advantage of the naturally available meadows and deciduous woodlands surrounding their abode to sustain the year-round keeping of pig, sheep/goat, and cattle. For most of them, and perhaps all, mixed farming continued to be a pillar of the productive economy.

Such diverging approaches to subsistence, however, might have responded to an overarching principle that tied them all together. This is a new, more flexible concept of the residential group, which grew progressively disengaged from Neolithic ideas of the village as the place where the community would have dwelled together "since the beginning of time" (Dolfini 2015; Robb 2007). In the palimpsest of impermanent villages, dispersed farmsteads, and seasonally inhabited caves emerging from the late fifth millennium BC, one senses the ghost of large social units splintering along gender, age, and kin lines for subsistence tasks that took them away from the village and into the broader landscape. Tending to gardens, foraging in the woods, and moving the herds from pasture to pasture were now activities that might have characterized subsections of the social group more markedly than in the full Neolithic. Some of these tasks, such as hunting red deer during youth initiation rites and sharing the meat of a slaughtered cow to seal a marriage, would have served the purpose of reinforcing corporate identity as much as of supplementing a largely vegetarian diet.

As the tie between co-residence and the common history of the group stretched to a breaking point, burial was gradually reshaped as *the* medium around which social relations could newly coalesce (Dolfini 2015; Robb 1994b). This is perhaps unsurprising considering that, since the sixth millennium BC, burial had been a prime means for ascribing group identity and structuring social interaction. Yet, as it changed in nature and grew in importance, burial underwent three profound alterations in its form and meaning. The first was a new social desire to create a special locus for the dead, separate from the living; the extramural cemetery was thus born. As I have argued, its waxing was concomitant to the slow waning of the nucleated village as a cultural resource. It could perhaps be said that the demise of the village, social if not always physical, necessitated the cemetery to be invented, insofar as smaller and more dispersed communities did require meaningful places to bury their dead, commemorate their ancestors, and ultimately reinforce the common genealogic ties that the new lifestyle had loosened.

The second alteration concerns the very nature of burial. Mortuary practices grew increasingly complex (but also normative and formulaic) in the Copper Age, to a degree unparalleled in the Neolithic world. This change may be explained with the growing importance of genealogy. Since kin group ancestors had become the core medium of social reproduction, a straightforward funerary rite no longer responded to the novel need to commune with them. Genealogy had to be played up to tie together the threads of a common history that the diminished role of the village had

thrown into jeopardy. The ancestors, either real or conveniently "rediscovered," were the obvious means for doing so (Robb 1994b). In the fourth and third millennia BC, people increasingly defined themselves by handling, circulating, breaking, mixing, and reburying the physical bodies of their forebears in a bewildering array of ritual practices. Formally, such practices would have been justified by a richer and more subtle categorization of the deceased in terms of gender, age, and perhaps status (Fowler 2018). At a deeper level, however, they were motivated by a fresh desire to stress group identity and lineage ties across generations. Importantly, these practices required a grave structure that could be shared by the living, the newly dead, and the ancestors on equal footing; hence the chamber tomb and burial cave.

The third and perhaps deepest change lay in the social understanding of the human body. It appears that in central Italy, as elsewhere, the body was reconceptualized as a more partible and transgressible entity than it had been previously (Chapman 2000; Fowler 2008, 2015; Jones 2005). Body parts and substances endowed with symbolic qualities could now be extracted from the dead and employed in a wide range of ritual interactions and exchanges. Though hardly new, the practice grew in frequency, complexity, and social significance during the fourth and third millennia BC. Material culture played a major role in the process. As the bodies of the dead were broken up to secure their transformation into ancestors, their grave goods, presumably matched with specific body parts (e.g., head/battle-axe and limbs/arrows; Fig. 8), were recirculated among the living in mutually reinforcing signification processes. Comparatively rare articulated burials offer insights into the cultural logic underpinning this behavior. By using recurrent, stereotyped sets of goods, individual burials presented the identity of the dead as normative, institutionalized, and immutable (Dolfini 2006a, b). Such a significant countertrend to prevalent disarticulation practices has long attracted researchers' attention.

It is frequently suggested that the rich panoplies of stone and metal weapons accompanying articulated male bodies indicate that the deceased was invested in life with political leadership. Some see these individuals as the forerunners of a social archetype of the European Bronze Age: the "warrior-hero" (Hansen 2013; Jeunesse 2014). Following a well-rehearsed ethnographic analogy, others interpret them as

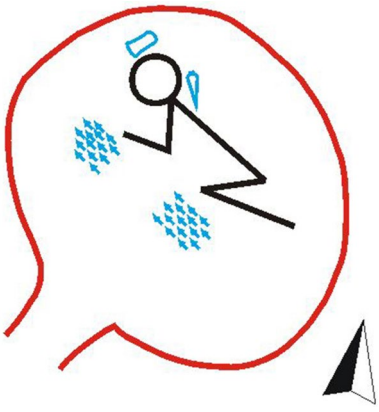

Fig. 8 Reconstructed layout of furnished male burial from Rinaldone, tomb 8. Note the stone battle-axe placed above the head, the metal dagger at the back of the head, and the two sets of flint arrowheads lying next to the limbs. The chamber grave had a south-facing entrance corridor; dimensions are unknown (Dolfini 2004)

"Big Men" who would have grounded their power in the procurement and display of prestige-giving *exotica* (Cazzella 1998, 2003; Dolfini 2004). Both groups of scholars see in occasionally well-furnished child burials instances of ascribed status (Cazzella and Guidi 2011; Guidi 2000, pp. 58–59). This is taken as further proof that structured inequalities emerged at this time out of largely egalitarian Neolithic society. Robb (1999) has put forward a thought-provoking explanation for the emergence of social ranking in Late Neolithic and Copper Age Italy. He maintained that, in the Early and Middle Neolithic, the disparate forms of prestige created through various activities were not organized around unitary kinds of value associated with social eminence. One could be a religious leader, a master potter, or a fearsome warrior, but not all of them at once, for these domains of action were not commensurable. This changed from the late fifth millennium BC, and increasingly so in the fourth and third millennia, as personal prestige could first be accumulated by a person through manifold fields of action. Grounding their deeds in the new gender ideology gaining momentum at the time—Robb posited—successful political leaders could now rise to prominence and naturalize their claim to power through the display of iconic goods, first and foremost metal weapons. This would be a "great simplification" in sociopolitical structures akin to the shift from "Great Man" to "Big Man" societies in the ethnographic landscape of highland Papua New Guinea (see also Robb 2007).

While all these readings retain elements of value, I caution interpreting the social changes in overtly political terms. First, both Big Man and warrior-hero explanations focus on relatively infrequent articulated burials (especially if male and weapon-rich) at the expense of widespread disarticulated, female, and poorly furnished inhumations. As we have seen, however, both articulation and disarticulation were employed in Copper Age Italy as meaningful funerary practices. They were ostensibly used for different categories of people based on aspects of their personal identity, the circumstances of their death, and other context-specific factors that may be difficult for us to map out. At several chamber grave cemeteries, moreover, and at all burial caves, no well-furnished articulated burials survive. Does it mean that these communities lacked political leaders worth remembering? Or did they dispense with structured leadership altogether? While these are, of course, possibilities worth considering, one could propose alternative explanations. These should focus on the broader cosmological meanings embodied by burial, including the desire to preserve the bodily integrity of select individuals in death and to reconfigure aspects of their personal identity in a highly stylized manner (Dolfini 2006a). In Copper Age Italy, not all routes to ancestorhood followed the same path. While most of the dead had their individual identities erased during the burial process, others had theirs refashioned following strict cultural norms and conventions. These were men, women, and children alike. Some were given identity-enhancing objects, others were not. Current political interpretations create an artificial separation between a few male, well-furnished, articulated burials and "the rest." This invites caution in receiving them.

Second, current readings tend to overlook the complex taphonomy of Copper Age funerary sites. Most chamber graves, and virtually all burial caves, were venues for multiple interactions between the living and the dead; on occasion, these lasted for hundreds of years (Conti et al. 1997). At these sites, what we see as archaeologists

is the final stage of the burial process, but we do not know (except for the articulated burials) how the process started, or, for that matter, how it unfolded. Political readings of Rinaldone-style and coeval burials are grounded in the unspoken assumption that lavish assemblages of goods were solely placed with the articulated dead. However, several clues suggest that this practice was far more prevalent than we can now appreciate, for objects were frequently moved out of the grave following the body parts to which they were symbolically tied. For example, funerary vessels and necklaces, which are invariably found broken and incomplete in reorganized burials, were laid whole at the time of the funeral (as seen in articulated burials). These objects were ostensibly fragmented and scattered during the burial process to create enchained relations (*sensu* Chapman 2000) linking the living, the newly dead, and the ancestors. This also may be true of the weapons occasionally found with disarticulated and commingled burials. Once again, readings focusing on the social need to express different kinds of identity in death and to erase or maintain it during the burial process might better account for the evidence than overtly political interpretations.

Third, sociopolitical explanations invariably assume that metals were intrinsically valuable and rare commodities in the Copper Age world. As the archetype of all prehistoric prestige goods, it is frequently presumed that metal was appropriated by self-aggrandizing individuals to naturalize their claims to power. However, large-scale phenomena of metal accumulation, hoarding, and display are conspicuously absent in Copper Age central Italy; the richest individual burial known to date features six metal objects, while other alleged elite burials have merely one to four (Dolfini 2004, p. 227). In nearly all cases, metals are part of wider grave assemblages comprising flint, hardstone, and bone objects; there is nothing there, but our intrinsic bias, to underpin the belief that metalwork was more important or valuable because of the material of which it was made. Furthermore, it is not clear how rare a commodity copper was in early Italy. Though far from exhaustive, the latest research shows that much more ore was extracted and smelted, and much more copper was cast and used, than the archaeological record would have us believe (Lemorini 2012; Pearce 2009). As we have seen above, people routinely crafted and used metal tools at settlement sites, but these have become invisible due to widespread recycling. If metal was not a scarce commodity in early Italy, what was the source of its value? This might have resided in its striking visual and technological properties, or its novel funerary uses. Metal may have been valued for its unparalleled luminosity, its color palette, and its ability to be refashioned into new objects (and thus be inscribed with new meanings). Of course, it also was valued as a powerful diacritic for new gendered and aged personae (Dolfini 2008; Keates 2002; Robb and Harris 2013).

The notion that metal was the ultimate trigger of social inequality is usually compounded by the claim that it was exchanged over long distances as a prized, prestige-giving material. In this respect, too, established interpretations need nuancing, as the data do not point to a steady intensification of social interaction from late fifth to late third millennia BC; they signal instead two separate trajectories: the peaking of long-distance communication and exchange in the late fifth millennium BC, and its sudden reversal to more self-contained circulation spheres in the early fourth millennium BC. Multiple, overlapping markers such as the exchange of Lipari obsidian

and Alpine greenstone, as well as the spread of superregional pottery styles, hint at heightened connectivity in the Late Neolithic. However, these trade networks broke down abruptly, and all at the same time, in the Final Neolithic. In a time span of no more than two centuries, the reach of obsidian and greenstone receded from more than 1000 km to less than 200 km, while once-pervasive pottery styles splintered into myriad craft traditions. New materials such as red jasper and steatite, and of course copper, came to the fore instead; long known to people, they had never elicited so much attention, by so many, prior to this time. Silver and antimony were perhaps the only materials to be genuinely new to Copper Age society. They might have been discovered by adapting copper reduction sequences to noncopper ores. Certainly, they were locally invested with social meanings stemming, it is presumed, from their unique white-silvery color, superb shine, and unparalleled reflectivity. All these materials, with the partial exception of metal, traveled no farther than 200 km from their sources, and often much less.

These considerations cast further doubts on the ability of power-hungry individuals to leverage the exchange of desirable artifacts for political purposes. Jasper, steatite, and most metal would have traveled through the network in a few days or weeks. Could control over them really attain political power? Even if they were displaced by longer lasting down-the-line or other indirect procurement mechanisms, it is unclear what special status could ever arise from objects that may have been within the reach of most adults in most communities (Robb and Harris 2013, p. 71). Compared with the sprawling web of Late Neolithic obsidian exchange, the Copper Age prestige goods economy, if it ever existed, must have had a decidedly local flavor. This is counterintuitive: if the power of distance bestowed tribal leaders with political authority, why did it wane when emerging Big Men would have needed it the most to consolidate their grip on increasingly scattered communities? Once again, we are left to wonder whether current political interpretations of Copper Age society are overstated. Rather than being the cradle of social inequality, I maintain, this period might be better understood as a turning point in the development of new cosmological beliefs and ideas of the person, laying the foundation for the Bronze Age world.

Conclusion

In providing a critical synthesis of the archaeology of Late Neolithic and Copper Age central Italy, 4500–2200 BC, and placing it in its wider peninsular context, I have discussed the latest research advances in the fields of relative and absolute chronology; settlement strategies and the productive economy; the circulation and exchange of socially significant materials; the rise of copper, silver, and antimony technology; and changes in funerary practices and ideas of the body. Specialists have frequently interpreted the new data in light of well-trodden narratives that stress the inevitable rise of social inequality, focusing on the appropriation of metals and other prestige goods to naturalize chiefs' claims to power and, for some authors, the right to transmit it to their offspring.

I argue that the evidence should be interpreted differently. First, the idea that the long-distance trade of valuable substances would legitimize political power is problematic in the context of prehistoric Italy. Sought-after stone materials were widely exchanged in purportedly egalitarian Neolithic society, but their sprawling network came crashing down at the onset of the Copper Age. This is precisely the time when elites are alleged to rise. It is hard to imagine a worst time to rid society of a readily available source of prestige: the power of distance (Helms 1983). Proponents of these readings suggest that a shiny new valuable, metal, replaced early stone materials as the prestige good *par excellence*. Yet this is grounded more in an act of faith than in a dispassionate examination of the evidence.

Metals were doubtless important to Copper Age people; just consider the way they were used in carefully choreographed funerals. Yet they were too abundant and widespread to be sources of economic value, and they were used too often as mundane cutting tools (e.g., to work animal bone and steatite) to become the blanket prestige material that they are alleged to be. As for being exchanged over long distances, the jury is still out pending further provenance analyses. Based on the limited data presently available, however, it appears that most metals were procured locally, although some did come from faraway lands. Even those objects, however, were refashioned into familiar-looking axe heads and daggers by central Italian smiths; most likely, any memory of their being rare and prestigious *exotica* was lost on remelting (Dolfini et al., in press). Things undoubtedly changed in the Bronze Age, when tin trade once again connected distant regions of prehistoric Europe with one another. Prior to this time, however, the social value of metals was principally phenomenological, situational, and performative. Metals would have been appreciated for their unparalleled shine and luminosity, their ability to be inscribed with new meanings through recasting and refashioning, and their power to mark out increasingly salient gendered and aged identities in burial.

Furthermore, the pulverized settlement patterns that characterized central Italy from late fifth to late third millennia BC do not show power and resources being concentrated in emerging central places. Quite the opposite, as people lived more scattered and dispersed lives at this time than ever before. This began to change in the third millennium BC, when substantial villages were again established in fertile plains and river valleys due to improved farming technology. Even these settlements, however, lack the telltale markers of inequality seen, for example, at fortified Chalcolithic settlements in Iberia. Barring sensational new discoveries and revelations, Copper Age Italian settlements are best conceptualized as medium-to-large agrarian villages made possible by transformations in the productive economy. Their ditches and palisades were not constructed do defend the metal wealth of tribal chieftains but, more prosaically, the crops and animals of farming and herding communities.

Finally, I have argued that well-furnished individual burials should not be taken as proof of emerging political leadership—a reading that I, too, espoused earlier in my career (Dolfini 2004, 2006a). These interpretations stand on a selective reading of the burial record, focusing on a handful of articulated male inhumations at the expense of many hundreds of disarticulated, female, and poorly equipped burials; on a misinterpretation of the Copper Age funerary process, which possibly entailed a much higher number of organized and furnished interments than we see

archaeologically; and on an overestimation of the importance of metals, which were invariably part of broader assemblages comprising stone and bone objects, too. Following Robb (2007) and Robb and Harris (2013), I have suggested that individual burials signal the rise of new forms of personal identity stressing gender, age, and other aspects of the deceased's personhood that may be harder for us to discern. Unlike them, however, I maintain that these burials can be understood only as part of a broader spectrum of funerary practices used by society to turn the newly dead into ancestral beings. This is especially the case in central Italy, where both articulation and disarticulation were meaningfully employed as legitimate pathways to ancestorhood. The former would have integrated the newly dead into the undifferentiated realm of the community's forebears, while the latter would have secured singular, and perhaps individualized, remembrance.

This does not mean that structured forms of leadership did not exist in early Italy, or that self-aggrandizers lacked opportunities to elevate their standing by manipulating multiple domains of action. What I have questioned instead is the idea that political power was single-mindedly expressed in the grave through supposedly rare and prestigious metal objects. Indeed, funerals and metalwork may have played a role in prehistoric power struggles, and they probably did. However, aspiring leaders would have maneuvered these media in more subtle, varying, and context-specific ways than current readings have us believe. Their strategies did not necessarily leave any discernible imprints in the burial record.

In this review, I have highlighted several problems deserving further research. First, the atomization of domestic pottery styles in the fourth and third millennia BC, and the parallel growth of normative funerary ceramics over wide areas, invite social explanations away from worn-out and poorly theorized notions of the "archaeological culture." Second, the reappearance of substantial village communities in the third millennium BC requires dedicated research focused on the role of the plow and cart in their rise, and on the relationship between settled and mobile communities. Third, the imbalance between hyper-studied Neolithic obsidian and greenstone exchange and understudied Copper Age stone and metal trade must be addressed urgently. New research will clarify if the realignment in trade networks discussed above is as all-encompassing as it now appears; if metal became the new material affording wide-ranging exchange, and when it did so; and what social mechanisms and agents underpinned the new networks. Fourth, the evolution of copper smelting and working sorely needs reappraisal. Questions regarding the transformation of copper reduction technology from the Late Neolithic to the Late Copper Age bear important consequences for our understanding of technological change and knowledge transfer in early Italy. The same is true of metal casting, smithing, and working.

Perhaps the biggest challenge of all, however, lies in aligning Italian prehistoric studies with the growing amount of research into mobility and migration in Neolithic and Bronze Age Europe. Cutting-edge scientific methods including stable isotope analysis and ancient DNA sequencing are now being used to rewrite the early history of Europe (e.g., Kristiansen et al. 2017; Parker Pearson et al. 2016). Yet they have seldom been deployed to prehistoric Italy, with no studies yet available for the central peninsula, 4500–2200 BC. Out of many hundreds of Late Neolithic to Early Bronze Age Europeans whose ancient DNA has now been sequenced, only eight are

from south of the Alps (at the time of writing); of these, seven are from northern Italy (including the famous Iceman mummy) and the eighth is from Sicily (Allentoft et al. 2015; Keller et al. 2012; Olalde et al. 2018; Sikora et al. 2014). As for stable isotope analysis highlighting residential mobility, the few studies published to date overlook the central peninsula, as well as much of the period in question (Cavazzuti et al. 2019; Tafuri et al. 2016).

Significantly, I have provided a critical context for evaluating mobility and migration in central Italy (as and when isotopic and genomic data will become available), preempting some of the more controversial interpretations proposed for the continental evidence. For example, the earliest instances of individual inhumation and warrior burial seem to predate the spread of steppe ancestry and related cultural phenomena across western Europe. It appears that, in Italy, the new burial customs arose out of internal dynamics rooted in Neolithic social practices. Moreover, I have raised fresh questions that could profitably be addressed through archaeological science. How was kinship expressed in burial? To what extent did the communities of the dead laid out in chamber tombs and burial caves reflect communities of the living? What social mechanisms underpinned the trade of valuable materials, and how did they change from the Neolithic to the Copper Age? Who was in charge of moving greenstone and obsidian over long distances, and who took care of the copper, jasper, and steatite? Did individuals move across vast geographical and social landscapes, or did they pass materials and objects down the line? Finally, did Italian society contribute to the spread of new ideas concerning burial and the body across prehistoric Europe? To what extent was Italy on the receiving end of the momentous social changes that affected the continent in the Late Neolithic and Chalcolithic, and to what extent did it contribute to them? The revised chronology discussed in these pages, assigning the birth of the Italian Copper Age to the mid-fourth millennium BC (a time predating the inception of Late Neolithic/Chalcolithic practices in most of western Europe), suggests that not all light may come from the Orient, after all. It is perhaps time that we started looking south.

Acknowledgments The ideas discussed in this article developed during 15 years of research into prehistoric central Italy. Many colleagues have contributed to their shaping, but I wish to acknowledge here those who have exerted the greatest influence, namely my BA dissertation supervisor and long-term mentor, Dr. Nuccia Negroni Catacchio; my MA thesis supervisor, Professor R. C. De Marinis; and my Ph.D., supervisors, Professors G. Barker and J. E. Robb. I thank Gilberto Artioli, Ivana Angelini, and Cristiano Iaia for enhancing my studies of early Italian metallurgy. I am grateful to Francesco Carrer, Vanessa Forte, Chris Fowler, Cristiano Iaia, Mark Pearce, Robin Skeates, and the anonymous JARE reviewers for commenting on earlier versions of this work; to Giovanni Carboni for custom-assembling Fig. 2; and to Eleonora Montanari for helping with the bibliography and images. All opinions and errors are mine.
